edging of Cerastiam, and dotted with Dactylis glomerata. A bed of golden Pelargoniume, Harry Hieover, with a broad band of Viola Mulberry Qaeen, dotted over with Liliam auratum; a bed of mixed single-flowering tuberout Begonias, dotted with Hydrangea paniculata, was good. In another, silver and green-leaved Pelargoniame were planted together ; in another Love Lies Bleeding was intermixed with blue-flowered Lobelia and Dracæna indiviss.

As will be imagined by the reader, the talent of the superintendent in devising pleasing mistares of flower-beds is of no mean order, and I could very considerably lengthen \(m y\) list of combinations, did it appear desirable to do 10. The Pentstemon finda sbundant ase in the park, mixed with Violas and Mask, \&cc, Liliam longiforum var. Harrisii, Dahlias, Gladiolus, Ealalia gracillima, and Ficus elatica are

Fig. 75.-carrot, scarlet model.
ton people will not be long before they recogaise the incongruouness of ach decorations. Ed.].

On the terrace were some good examples of bedding, in which the blaze of scarlets, pink ard other colours was toned down by dot plants of a graceful character. Pelargoniams, at the tims of my visit, were in good bloom, better than I had seen them at places further south. Some fine bed connisted of blue and white Lobelias, with Harrimon's Mak as groundwork, the latter just bowing through the Lobelia, the bed being thinly dotted with small plants of Grevillea robusta. One good bed was planted with Weat Brighton Gem Pelargoniam and dark Heliotrope Garibaldi; another had Pelargoniam John Gibbons, dotted with Abutilon Thompsoni variegata. Other beds consisted of Henri Jacoby Pelargonium, with thin lines of the variegated Grass, Dactylis glomerata, planted diagonally across the beds. Some raiwed bede were edged with Echeveria secuinda glauca, aud planted with blue and white Lobelia and Love Lies Bleeding. Another bed had a flling of Weat Brighton Gem, and an
much employed, and the unaal clan of aubtropical plants lend grace and beauty of leat to the more sheltered parts of the ground. Roses are in excellent condition here, and although the plant were cat down to the anow-line by frot last winter, very few were lost, and they have since made vigorous growth and flowered well. Many of the best varietiea are to be found here, and the soil appears to be very waitable for the Rose, as well as for Gladiolus Brenchleyensir, the latter being planted early in the spring between the Rosen, so that a bright mase of colour is obtained in the beds when the Rower are past. Many of the apikes bad three and four branches. The herbaceons border occupies a good position between a large tennir-court and a bowling-green, and is 30 feet wide, and 200 feet long. The plants with which it is planted aeem very well chomen, and convisted chiefly of Preonies, Poppies, Delphininms, Phloxes and Helianthu:; Cactus and other varieties of Dahlias being planted amongat the perennials for affording an antumn display. In a emall arboretum near the band stand, are nice specimens of Conifers,
vizo, Abien concolor, Thojopsis dolabrata, Tuga canadensi, Capressus Lawsoniana variegata, \&e A large lake for akating and boating is supplied by water from the river Stearn.

The lske in furnished with several islets, grottos, and waterfall. The shrabi and trees with which the isles are planted consist of golden-leaved Elder and Willow, the latter having leavea of light green tint, and the whole contrasta well with the carrounding trees. Some old Willow trees of large size growing near the lake contribate greatly to the general good effect seen in this part of the park. For the amusement of the pablic, boats are placed in the lake, and bowling, croquet, and lawn-tennis ground have been laid out. Some usefal span-roofed houses stand in the garden, together with cold framer, and pite for the propagation of the great number of planta that are required for the bed and bordert. Spergula arvennis aurea, a mall yellow-foliage plant natable for carpet bedding, has been largely increased for use another aeanon, and a large mock of Viole Countean of Hopetoun is in course of preparation, B. W.

\section*{VEITCH'S SCARLET MODEL CARROT.}

This new variety of Early Horn Carrot, ahown in our illutration (6g. 75), belongs to the stump-rooted clase, of which Nantea and Carentan are good typea of late varieties. In this clase the root has an almont equal diameter at top as at bottom, and there is, therefore, less of the contral watery portion. The variety is well adapted for botbed and early out-ofdoors mowinge, coming quickly into use. When fallgrown it make an excellent exhibition apecimenroot, as was well observed at the vegetable show at Chiswick on September 5 last, in roots grown by Mesars. R. Veitch \& S on of Exeter.

\section*{Plant Notes.}

\section*{LYGODIUMS AS ROOF AND PILGIR PLANTS.}

Thnes plante are eapecially adapted for covering roofs and pillars in glasthouses. They are evergreen tove or warm-hoase plants, and in most cases the atems are better left antil they turn brown, but in the case of L. japonicum, it will be found best to train up freeh foliage each year, entirely removiog the old atems. The compost whould bs a rich one, as they are vigorons-rooting plenta, and when the aoil becomen filled with roots, they will be benefited by liberal applications of liquid-manare. The species best known, and most usefal in our gardens are L. japonicum, a native of the tropice of the Old World, and a very elegant light-growing plant, the lower fronds upon ite stems being barren and lens divided in the segment than are the upper and fertile ones. For covering the roof or a back wall, this is perhaps the best.
L. dichotomum is of a mach more robust habit, producing a profution of dark green foliage, the stems of which are much stronger, and last in good coadition for two or three yeary; this is a native of Tropical Asia. L. venustum, introduced about 1850 from the West Iadies, \&z., is a most deairable plant. The hardiest apecies is L. palmatam, native of the United States of Ameriea, a rather mall but usefal pot plant, with amall four to six-lobed palmate pinaules; the fertile pinnule are mach divided, and give the plant a diftinct appearance. Other species less often observed in gardens are L. pinnatifidum, L. articulatum, a New Zealand plant forming a good atage plant, and L. reticulatam from the Polynesian Isles. In some casen these plants will not take kindly to the division of their rhizomea for propagation, but remain atationary after the performance, but alticastely atart into growth. Where apores can be obtained (and they are freely produced apon ame apecies), they thould be utilised for their increse. \(R\). L. Harrow.

\section*{dunedin, streatham hill.}

The residence of N. Sherwood, Ezq., head of the well-known fim of Hurst \& Son, seed merchants of Houndsaitch, London, is a model of a pleasant retreat within easy diatance of the City, and around it the gardens are in keeping with the comfortable dwelling. Within their moderate limits something of every branch of horticalture is done in a creditable manner, the whole forming a done in a creditabering example of what may bo accomplished in the apsce usually allotted to the arbarban garden. Arjoining the houze is an ornamental octagonal structure, whose interior is converted into a beauticul sockery planted with Ferne, and over which a mine math. A pleating
runs into an ornamental batin beneath. feature in the rockery is that no crads imitation of nature is attempteà, such as one often sees in rockeries under glase, and which seems altogether out of place under a roof; but, rather is the rock of the atalactite cave imitated, and that, too, with happy offect. From the terrace outside the Fernery the eye takes in the smooth well-kept lawn, bounded on each hand by borders, still gay with flowers, and especially with the late-flowering annoals, which also make such a fine show among the Gladiolus in the garden at the end of the lawn; and through which rans an arched patb, clad with Roses and climbera, having fragrant flowern. Striking objacts on each side of the lawn are clump of Rododendrons, large Arancaria imbricata, Cedar of Lebanon, and other trees, all of which have been planted with a view to effect. The show of flowers in the open garden may now be quickly terminated at any time, and then the beauties of the stately treen and ornamental shrabs will become more visible.
O. chids of the nhowier apecies have for a conniderable time been grown at Danedin with suecens, to far an the cool-house speciel, which are most liked by Mr. Sherwood, are concerned, and the saccess is in a grest meavare due to the saitable house provided for them. The ground beneath the plant-stages not teken up by the rain-water tanks is planted with Ferns, foliage Bogoniaz, \&cu, the foliage reaching up to the ataping which runs on each side, and over the edge of which depend Isolepis gracilip, mingled with Maidenhair Ferns. Sach an arrangement is not only beneficial to the plants, bat makes a pretty feature in the house. The bulk of the plant consist of Odontoglossum crispum, which, jadging by their atout, plamp pseado-bulbs and the many robast flower spikef, show the correctnens of the treatment afforded by Mr. Jones, the gardener. Here, too, the Maedevallias, Oncidium macranthum, Odontoglonum Edwardi, and others of that clans thrive, and are at the present time sending ap flowerapikes; and a row of Sophronitis grandiflora represents that pretty cool-house plant at its beat.
At one end of the house are several atrong plants of Coelogyne corragata, which thrive here, and bloom profasely grown with the Odontoglonsams. In many places where it is grown in warmer housee, the plant does not flower, and in some canea soon perishen. Among othera, Manderallia bella and Odontogloseum grande are in blonm, and many other well adranced in bud. Near the cool house is a mall, rock-lined, unheated nook filled with very fresh-looking specimens of Todea superbs, Todea peilucida, \&c.
At tiae eid of the Cattleya-house is a grecup of Dendrobiam formoum qiganteurn, D. Pha'ænopais Schroderianum, Cettlega maxima, Oacidium Jonegisaum, and other showy species; and in the small warra houss bejond, Dandrobium Johosonix and other hothoue Dindrobiums are thriving. The Cattleyas are the least, natisfactory, probably owing to a dilifeulty in applying bottom ventilation on one aide of the bouse, bat to obviate which an attempt in being madr. In this honse variegated Panicum effeet.
In another little houes, a basoh of Mutonia vexillaria, Coelogyne crivtata, end the Cypripedium kre
doing well. Then follow a houre of Cyclament, Primalam, and Boavardiay, and a very pretty rockhouse planted with Ferns, foliage Begonias, and other ornamental plants, and with the trailing Fican atipularie clinging to the rock; and at the end a Fern-honse is reached, in which the different varieties of Gymnogramma are truly magnificent, the large specimens of gold and ailver varieties being specially beautiful. The Adiantums, too, are good, as also fine plants of A. Farleyense and other Ferne, which are arranged with the Gymnogrammas.

\section*{FRUIT REGISTER.}

\section*{THE STRAWBERRY-RASPBERRY.}

This magnificent fruit is one not generally known ; it in a native of Japan, and is known botanically as Rabus sorbifolias [ \(=\) rotæfolias?]. In manner of growth, it is somewhat similar to our common Raspberries. The young plants commence bearing when only about 2 iaches high, and full-grown buybes vield heavy crops of fruit. The leaves of this plant are somawhat like a Rose bush. The fruit is of large size, a brilliant red colour, and very deliciously flavoured; it resembles a huge Strawberry very much, and hence the name, Strawberry-Raapberry.
Being such a fine fruit, and so different from all other kinds, it will be widely caltivated when better known. It can no doubt be used for every purpose that our Strawberries and Raspberries are pat to. In regard to hardiness, I believe it will succeed over a wide range of conntry. S. L. Watkins, Grizzly Flats, California, in "Canadian Horticulturist."

\section*{The Weak's Work.}

\section*{THE FLOW}

By bailex Wadps, Gardener, Birdall Gardens, York,
climbina plante. - Thome that are planted geainst walls, pillare, or on rastic-work of any kind, and which have grown atrongly, should have the atrong shoots thinued out, and then be nailed or otherwise secured. Most persons prefer a free mode of securing climbing plants, so that their natural habit is not overmuch constrained, and any severe cutting-back at this season should be avoided, especially of those which are evergreen.

IVY. - This, if of rampant habit, should have all the shoots that are not clinging fast to Whatever they are growing against, removed, but on no account should the foliage generally be cut off at this time of the year. The planting of Ivy wherever it is required may now be done, and beyond the necessary securing of the plants quite close to the wall, \&c., atter the soil has sunk, not much farther training is called for, it being better for the joung plants to get strong at the base, and form a good foundation of young ahoots that will cling to the wall of themseives. Edgings of Ivy will, after a few years, begome weedy, and imposible to clean. In auch case, it is the best practice to take up the plants of which the edginga conait, dig the groand, adding new aoil and leaf-mould, and planting it with young plants.

AMPELOPBI8 QUINQUEFOLIA, nnd other species that have grown out away from the wall, should have the ahoote thinned where growing too thickly and heavily. The shoots themselves have a graceful appearance when the foliage has fallen, bat care should be taken to make them ecure againat the wind.

JASMINES. - The evergreen specien should be thinned, and treated in the ame manner as Ampelopsis for the present. Jasminum nuduflorum is now generally coming into bloom, and the shoots should be left in the way they have grown till flowering is pant.

CLEMATIB Flamula (Virgin's Bower), and C. vitalba (Traveller'a Joy), bhould be left for the present in their wild beauty, also the hybrid garden varieties, although these last will require to be made secure againat the wind. Moat of them are secure ennagh if there be anything to which the shonte and tendrila can cling to or twine around. This year the Clematisen. \&co, have grown and bloomed laxariantly. Cbimonanthua fragrana. Choisya ternata, Cotoneanter mictophylla, C. Simonai, Cratagas
prracantha, Cydonia japonica, C. Maulei, E'my reflexus, Eucallonia macrantha, Garrya ellipties, ,ut the varions apecies of Loniceras may now be platere
care being taken to have the drainare made Fibry half-rotted loamy leaf-mould and goold manare make a compost for thene planta, rivied afford them a good start.

RHODODENDRONs.-The present in a gioat the to make new beds of peat or light fibry-losay nim for these plants. The soil, if it maut be excarnta should not be less than 2 feet in depth, and thens soil if not natarally drained muat be artificity denuded of its moisture. If lime be prenentinthy staple, every means must be adopted to ken water from it getting into the paat. In nomed tricts a mixture of peat, leaf-mould, lom, al barnt refuse will grow thene plants nitu torily, as also Pontica, Ghent, and mollis A'res Kalmias, Andromedas, Ericae, Gaultherim \(1 / 4\) zieaias, \&c., although a peaty acil in Provided these plants are well furnithel int wor masees, the planticg may proceed io mili mote till the end of November. The preenth mum will be favoarable for obtaining planta mith mil. matured wood and plenteous flower-bade,

\section*{THE ORCHID HOUsEs.}

\section*{By W. H. Werte, Orchid Grower, Burford, Dwhiv.}
cattleyas aigas and dowiana aumaOwing to the large consignments of Cattleys gigh C. Dowiana aurea and its variety chryotora, ima reach ua at this season, the excellent condition in which they arrive, and from the fact that ther my be parchased for low prices, many new growen my attempt their cultivation, and to ach a for bind on their management may be useful. Immedidet they are bought, carefully sponge them with will rain-water, and thoroughly examine every balb fux the Cattleya-fly. The pent may be found in the deformed paeudo-balbs, or if a small roond hole \({ }^{4}\) observed in any part of the bulb, ite exivanan is proved. Sometimes these innects appoar in in new growthe when they are only a few inder high; the growth then commence to swell at th base and to gradually taper off thinly at the top, wid make but little further progress. When the platht are ao affected the young growths should be catt of and barnt immediately. If once the fies in allowed nafficient time to establith themselven in the house, it is impossible to eradicate them bifen much damage haa been done, and perhapt mury valuable plant irretrievably ruined. Alter imported planta have been well cleaned tivy should be placed singly in the smallest pots por sible-just large enough to allow for one new growth. The pots should be nearly filled with routy drainage material, then hold the plant a trife abon the rim of the pot and fill up to the rhizome maller crock s , and ateady the plants if necessury tying the prendo-bulbs to neat stakes, bat ment mose or peat. The crocke in which the plantan placed shoald for a time be very aparingly mitand Thia being the season in which the plante makemis. roots, these will soon commence to pash ont wh the last-made preado-bulbs, when the piand then bo aupplied with peat and aphagnamoman equal parts. This should be packed firmly anuly the roots, intermixing with the compost s fer deenim pieces of crock to keep it open and to prevent position. Theze newly imported apecies should be subjected to the Cattleya-house temperatior otherwise the dormant eyes which are showing fj base of the foremost puendo-bulb will probably away into growth before proper root action mences, and although the planta may make mine good peendo-balb, they will not, owing to the of sunshine daring winter, become matured, and when their natural seanon ariven growth, those plants that break agsin will be and unvatiafactory. It is not possible to preven imported plant from making new growth nom, those which do atart should be given encoarage The pimill by heat and moistare, to grow quickly. The ppor object should be to induce root-activity, and growth as far as is practicable. While the g are dormant, keep them in the coolest part intermediate-honse, where water will quired occanionally. Some growero baokets in prefarence to the ordinary flower.po ee uo udvantage in doing this, ar batkemenime liable to decay. Baoketa are light and converian auspending the plants clone to the Yoontan wheril where low-roofed houses exiatt, the plana and at pots are juat as easily brought to the light, an more ander the grover's eye.

TEE HARDY FROIT GABDRN
By W. Pope, Gardenor, Highelers Castlo, Newoury.
DIFFERENT ABPECTB FOR WALL TREES - Some amocunt of care and forthbiaght are need - d in aelecting the muat aitable agpectar fofferent gorta and varitties of fraits. In mot diatricts, south walls are beat auted for A ric ite, Praches, and \(X\) elarines; but here, and coubtless in many other places a west aopect. suits them better, Aorient beina hoalthipr, and Prache more free from l-af hliater in zuch nn aspect. I Cherry-trea or two. if the fruit is wanted early, howaver, ohnuld be givan a place on a couth wall, good varieties for this parpose being Mayduke and Black Tartarian. Three neeful Plams well deserving the asme appect are Rivera' Esly Farourite, Jaly Green Gage, and Early Prolific. A fow earls liare, which should be cordons, as the fruiss are not offen legnired in large quantition,

 the trees till fully ripe, but, gathered se sion at they show indications of riparing, or they will b. mealy and insipid. Figs in the outhern countie Rencraliy do well on au! h walls, Brown Tarkey and White Marseille being good varieties. If epace can be found for a few cordon of red and white Currants, they will be found of great service in enmewhat lengthening the pason. Of Apricots, Hemokirk, Kaisha, Naw Large Early Pagcb, and Muorpark are smong the best. Good Peaches are Alezander, \(\mathrm{H}_{\mathrm{i}} \mathrm{le}\) 's Early, Early York, Dr. Hoge, Grome Mignonne, Belle de Duá, Drannd, Noblesse, V.olette It ive, Barrington, Walhurton Anmirable, Stirling Castle, Soa Figlo, and Salwav. O: Nectarinep, Eurly Riverf, Balgowan Violette Uû ive, S anwick Elrage, and Hamboldat are pows. Walla with an east aspuct are best for the pain cron of Charries and P:umn. Gand variatip of the former are Werder's Earlo Black, Ruine Hortenue, Fiarly and Lata Dake's, Bigarreau Nipoleon, 13 ack Tartarian. Farly Juboulhy, and E.ton. dessert Plamp, Green Gage, I)amienn's Saperb Haliok's Suoerb, Jeffereon. Kirke's, Tannament Gage, Coe's Gulden Drup, Reine Claude de Bavay \(\mathrm{D}_{3}\) Montfort, Monarch, Grand Dake, Angelina Burdett, Blue Imperatrice, Ickworth Imperatrice and of culinary varieties, Early Prolific, Orleans, Brince Eaglebert, Poad's Seedling Victoria, Mapoum Boo num, Dismond, Belle do Septembre, and Gie borne's. Wett welle are good for Pears. B-arré Saprsfio, Disenté da Comice, Darondean, Marécha

 Cingee, Matana Trpyva. Winter Nolis, and Josephine de Malises being rome of the bat for the different seanons; while for sewing thare is nothing better than Cisillac and Bellitime d'Hiver. North wails are eapacially usefal for MI rello Caerries, o which it is hardy possible to have too many. \(R\) ad Currants should also be planted in quansity on thi aspect, and a tree or two of the Victoria Plum, if foom can be spared.

\section*{PLANTR UNDER GLAB8.}

By W. H. Smerxa, Gardener, West Dean Park, Chichaster.
FREESIAB. - If thene bulbous plantsare required in loom at the end of the month of Decesaber, a batch of them should be placed in a houss baving a temperatare of about \(60^{\circ}\) at night and \(65^{\circ}\) by day, and afforded plenty of water; and when the pote are filled with roots, some suitable fertiliser may be used. The blooms of Freesias are very useful for catting, and a saccession of them rasy be obtained throughout the winter by placing batches of the bulbs in heat at intervale of three weeks. Place atick to the plants when 3 or 4 inches high, and syringe them frequently in bright weather.

DOUBLE-FLOWERED PRIMULAB.-These planta should be removed to a house having a temperatare of \(5.5^{\circ}\) by niphs and \(60^{\circ}\) by day. Such a house, if admitting plenty of light, will sait them admirably if they be placed close to the glase on shelves. Here they may remain till flowers appear, when if dearahle. they may be placed in the conservatory. These Primalas require mach light and plenty of apace in which develop their leaves, or the latter soon aprib

POINBETTIA PULCMERRIMA, - There plent should now be afforded a temperatare of \(60^{\circ} \mathrm{by}\) night and abont \(70^{\circ}\) by day, and a liberal trentment if large bract are looked for. Alway keep the
plante near the glase, to prevent drawing of the atem: and leaf atalks.

WINTER-FLOWERING BEQONIA8.-If these plent. have be-n pruprriv treated, a good show of blonm will be obtained towards the end of the jear. To ahow off Begonias in the beat manner, they should be placed thinly in a well-lughed glans house, raining them somewhat over a carpet of Mailen hair Fern. Tae temperatare of the house ahnuld no , bu lower than \(56^{\circ}\) by night, nor higher than \(65^{\circ}\)
to \(70^{\circ}\) by day. Guire de Scearax is admitted to be one of the finest varieties, and groaps of it look well if bordered with \(B\) Gioire de Lorraise. These winter-blooming \(B\) gonias require water in abuadance, when the pots are filled with rootr, and growth is active. A top-dressing of some kind of mild ferti liser will benufis them. Neatly stake and tie pach plant: usa tho syringe in bright weather, and keap the eir of the holiza moint. If aphis appear on thoma plants, fumigate the house with tobscco, or better atill, vaporise it with X L All, a very asfe and effectual imbly

FUCH8IA8.- If Fachaias have been uned in beddiog.ont, moote fit for msking catting will be plentiful on the plante, and a good number should be made. T'aey strike readily under hand-lighte at this mason, and when rooted they should be potted into (in's, and placed on the greenhouse shelf. If potteid on in the early spring, theae will make fine planta for summer decoration. [In cooler parts of the country than that in which our correspondent resides, bottom-heat will be peeded in the atriking of Fuchaias at this late part of the reasod. Ed.]

\section*{THE KITCERN GARDEN}

By Jorm Lambert, Gardener. Powis Cauch. Welshpool.
GENERAL WORK - Eadive and Lettuce will now require constant ateation in regerd to blanching. Lift the Endive, and tranoplant into framea for protection. If a mild autumn occur, Eidive may be kept good outaide up to Cariatmas by the protection afforded by mate, and the plants mary be lifted and tranalantel into boxes, and put into the Mushroomhouse, where they will soon blanch, and be ready for ase. Lettuce should be carefally looked over on warm, moist morninge, for sluga, and a davting of not or lime given in their haunts. Where a few Peas and \(B+a n g\) are still sown in the satumn, the ground ahould be gos ready, chooving a warm itartion, usually a south border, and groand that is well drained, lies high, and is fairly dry. See that dwarf Beans in frames receive plenty of air, and on all favourable nccasions the light may \(b\); taken off entirely. Water them when dry, and do not let them get overcrowded. Damp the soil occaionally daring suitable westher with sot-water, as s preventative againt red-spider. Make sowings of B tans at regular intervala from now onwards, if they are grown in pote, afford a not higher night temperature than 60 . The buik of the late Calery will require another earthing-up, for it will not be afe much longer, bat do not cover it up too mach at once. That it may keep well through the winter, the lant earthing-up should be left as late as possible, bat the leaves should not be exposed to sharp frost before this is done. A few mate thrown lightly over the plants will prevant this, in the eveat of a sharp frost occarring before the work is done. Toe same remark will apply to Leeks, except that frost is not 0 harmfal to them. If the Leek are fall-grown, they should be earthedup forthwith. Carrote will now bs ripening, enpecially in early districte, and may be lifted, choosing a nice dry day for the purpose. D, not cat the top closer than 1 inch from the crown. In a good root-house, ball nearly, or entirely, underground, and one not subject to inflax of water, root do not require so much eand or ashen for covering them; all risk from frost is avoided, and the roots are always ready for use. If sand or when be uted in sueh a houte at all, very little indeed will be required ia this way than in a clump, where often they are allowed to grow. Beetroot ahould be removed before sharp frosta occar. Lift with care, and twist the tope nicely off instend of cutting them. No roots, \(\operatorname{so}\) - Beet in particalar, should bo braised or broken. Orergrowa Beet should be rejuctran, a baingnnt worth toring. Hedges of Holly,
 Where they have been planted for ahelter, if given a final trimming \(n 0 w\), will not grow again, and frot will not diefgare them, as in the case of thone which make youge growith late in autumn. Abundarce of
work will be found in clearing away exhauted cropm of Peas, Beank, \&ce. Now Pea-sticks should b saved for ase next year. If it is denired to asvo any particular variety of Peas or Banat take advaritage of dry daye to pick the fully-marured pide without delay; and proose them in a vinery or ahed to harden before abelling or thisehing them.

FRUITS U氏O世 GG489.
By bicraro Paberb Gz-dene Gonhwood. Chichertep.
FRUIT TREES GROWN IN POTs.-The repotting or top-dressing in accordance with the raquiremente of the trees, should now be fiaished off, and the treea placed in their winter quartert bortly afterwarde. These fruit trees will be benefited by having the fullest exposure, provided the pote are protected from froste, which would cause the latter to barat. The pots should be planged above their rims in coal-ather, but failing this, protection may be afforded by wing tree-leaves, bracken, or long stable-litere ; and a quite open position in best for them, away from the drip of treav, and where water does not collect.. The trees should at this eason lie examined for the "brown acale," American blight, or other peat, and the proper remedies applied. For the firatnamed, nothing is afer or more effective than repeated syringing the trees with water at a temperature of \(130^{\circ}\); and for American blight, the infented branches should be well cleaned with astiff brash, the tip of which should be moistened with petroleum. The main atems and branches may also be painted over with whitewash made from freshly-alaked lime. Trees which have occupied the same pote for several years may be planted out-of-doors with advantage. younger ones being potted-on to take their places. . presear a preference bould be given to amall healthy trees. On receiving these from the narsery, the strongest roots should be shortaned somewhat, aid the plant placra ia rataer mall pors for the trst ane maiden losm as the basis of the ail used in the potting; to this ahould be added a relatively ara! quantity of wood-ashes and cruahed bones. The 2 inches in diameter at the butt end. The pots concaining these young treen may be plunged with the rest of the orchard-honse trees for the winter. Trees potted at about this date soon pay roxts into the new oill, and make early growith the following sesson.

8TRAWBERRIE8.-Bsfore the end of the present month, potced plata should be placed in ruch a position that the pots are not likely to be aplit by the action of frost. The general atock and late sac cessions may be planged anywhere in the open, as evere wather does not ha'm them, providing tha pots can be protected, and plants which get covered with now often go through evere frost with lent injary than other placed in orchard-hnases or other cool glass etractures. Those plants which are required for forcing early may be p'aced in pits and frames, where they can receive thorough protection from frost, and where the plants can be taken out of the planging material at any time during the winter.

POT VINES - The cane have ripened well mince they were atood oataide, and the foliaze should be allowed to remain on them, and allowed to fall naturally. At the approsch of frost the pots abould be tood close together and protected by bracken or long litter. Those intended for early work will be nove the worse for exposare to frost, as it ensares thorough reat in the plants. Tae canes may be shortened back to the required length amatims before they are brought into the forcing-pit, and those intended for "cat-backs" may be cut-back at any time while growth remsins dormant. Ia pruning these Vinea (cut-backe), three bude must be left at the bane of the vine-rod, the atrongest thoot which resulte from these buds being selectied, the two other being then removed.

Digtribution of Plantb at the London Park8.-Arrangements have been made for the diltribution to the pablic on the days named of any surplas bedding plante there may be at the following places:-At Clisaold Part, on tha 8 in inet.; Dalbury Park, Myate' Fields, Victoria Fombunkent Gardens, and Southwark Park, 16 :h: Baterepa Mark, 18:h; K wal Victoria Gartan, Nurb Whatwich, 2lot; Waterlow Parx, 22ad; Kenangtun Park, 23rd; at Brockwell Park there are no curplaa flante thin year.

\section*{EDITORIAL NOTICES.}

Advertisamente ahould be sent to the PUBLISERR
Newapapers-C'orrespondents sending newspapers should be carchal to mark the paragraphs they wish the Editor to ses. Ilustrations.-The Editor will thankfully rective and select photographs or drowings, suitable for reproduction in these pages, of gardens, or of remarikable planks, Nowers, trees, dc.; but he cannot bo responsible for lose or injury.

APPOINTMENTS FOR THE ENSUING WEEK.
MEETINGS

SALES.
Dutch Bulbs, at Protheroe \& Morris' \(\left\{\begin{array}{l}\text { Rooms. } \\ \text { Sale of }\end{array}\right.\) Sale of Nursery Stock, at the Arboretum Nurseries, Wood Lane, Isleworth, by Order of Messrs. C. Lee \& Son, by Protheroe \& Morris.
Dutch Bulbs, at Protheroe \& Morris Rooms.
TUESD 1 Y, OCT. \(15\left\{\begin{array}{c}\text { Sale of Roses, Frait Trees, and Pbo- } \\ \text { doderdrons, at Arches Farm }\end{array}\right.\) doderdrons, at Arches Farm,
Framfield, near Uclfield, by Order of Mersra. Wm. Paul \& Son, by Potheroe \& Morris.
Dutch Bulbs, at Protheroe \& Morris' Roomas.
Clearance Sale of Nursery Stock. at the Nurseries, Putney, by Order of Messrs. Mahood \& Son, by Protheroe \& Morris.
Bale of the Collection of Orchids of the Firs, Lawrie Park, Sydenham, by Order of C. Dorman, Esq, on Morris (two days).
Dutch Bulbs, at Protherod \& Morris' Roomes.
Important Clearance Sale of Nursery Nuck and Fruit Treee, at the colv, by Order of Messre. Pennel] \& 8ons, by Protheroe \& Morris (two days).
Sale of Live
Sale of Live and Dead Farming Stock, at Rose Cottage Farm, Enfield Highway, by Order of Mr. J. J. Wilson, Junr., by Protheroe \& Morris.
Linden's First Great Orchid Sale, at Stevens' Boome, Covent Garden Dutch Bulbe, at Protheroe \& Morris* Rooms.
Clearance Sale of Nursery Stock, at
FRIDAT. OCT. 18 \(\left\{\begin{array}{l}\text { the Loughborough Park Nur } \\ \text { feriee Brixton, by }\end{array}\right.\) ceries, Briston, by Order of Messrg. Ponsford \& Son, by Protheroe \& Morris. Chids, from Mestrs. F. Sander \& Co, at Protheroe \& Morris' Rooms.
EATURDAY, Oct. \(19\left\{\begin{array}{c}\text { Dutch Bulbe, at Protheroe \& Morris } \\ \text { Rooms. }\end{array}\right.\)

CORREOTED AVEBAGE TEMPGRATURE FOB THE ENSU. ING WEER, DEDUOED FROM THE OBSERPATIONS OF TORTY-TBRERE FEANS, AT OHTSWIOK- \(50^{\circ} .7\).

Sozuality of
A Papre on "Physiological ReFlowera. searohes on the Sezaality of the Flowers of Pinus densifiora, Siebold et Zuccarini," by Kenstro Fusil, Rigakushi, Post-gradaate Student in Botany, Imp. Univ., Tokyo, Japan, has been sent to us, and shows that the interesting subjeot of the origin of the sexes in plants is being stadied in the far east, as it has been in Europe and America; hat at present the problem is not solved, and the question arises, is it ever likely to be? We think not, beoanse we oannot fathom the phenomena of life, nor the immediate oanses of its varions physioal manifestations. We know that plants oan be bisexual or unisexual, monæcious or diœecions; we know that in the latter cases the plant may retarn to bisexuality, and that, as far as all angiosperms are concerned, it is pretty evident that biseruality preceded unisexality. But how does the latter arise? We see that trees and plants oan change their sexes in differsnt years and in different climates. We eren see bisexual plants become
unisexual late in the season, all the flowers, e.g., of some Umbelliferæ being male. But what is the cause? One general reply to this question is, that it depends apon varying degrees of nutrition. Mr. Mereinan and others have observed that, speaking broadly, the more vigorous trees or branohes of a normally bisexual character tend to produce female flowers; the less vigorous, males. Thus, Castanea, Hop, \&c., have been exampled, so that any cause which can bring about an increase or decrease of nutriment may have the effect of producing female or male flowers, respectively. Again, it has been observed, as by Knight, that a high temperatare tends to the development of male flowers, as in Melons; a relatively lower temperature, the production of frait. Again, fresh Melon seeds produced plenty of male flowers, but old seed an abundance of female. Hoffman and others have found that if the seeds of a bisexual plant, as Spinach, Mercurialis, \&c., be sown thinly or thickly, the proportion of male plants is greater in the latter case.
Hence a great number of coincidences of the above kinds have be:n noted from time to time; bat still this does not bring us one whit nearer to the solution of the question-what determines the sex? or why does the sexless embryo grow up into a male or female plant? We may know something of the external conditions requisite, but we can only see that the protoplasm or living substance of the plant responds to them and gives such or suoh result.
The late Mr. Croll wrote a pamphlet entitled, "What Determines Molecular Motion?-The Fundamental Problem of Life." He observes that there is always an " object" in all the results of life action; and that not one of the known properties of physioal foroes oan throw the slightest light upon the immediate oause of this "object." In the question before as this object is either a stamen or a oarpel. Why does the sexless papilla on the floral receptaole grow into one rather than the other of these two organs? No microscopioal examination throws the smallest light upon it whatever. The fact is, we neither know the nature, nor understand the powers of life. At this point the biologist is brought up sharply to a dead halt!

If we mast be contented with knowing only the external influences, then it is here that the practical or experimental part of the subject comes in. Taking a local incresse of nourishment as a primary canse of the production of a female flower, the author of the paper mentionad above finds that this can easily be effected in spring-time if the young shoots of Pinus densiflora are out, as is usually done in Japan, by an annual pollarding. A second method is by keeping only one or two shoots, and breaking off all the other adjacent young shoots at the top of the last year's shoot; thirdly, by oombining these two processes.

The anthor supplies a table showing that "out of forty-five branohes experimented on, nine produced female or hermaphrodite flowers in the position proper to male flowers; that out of twenty-one branches with marks of previous injaries, the shoots of five branches produced female or hermaphrodite flowers in the positions proper to male flowers. And that out of 2283 branohes which were neither pollarded nor had any marks of previous injuries, the shoots of only seven branches produced female or hermaphrodite flowers in the positions proper to male flowers. The ratio \(\frac{\lambda_{2}}{}\) is very small when compared with \(\frac{9}{45}\) or \(\frac{5}{31}\) "

He observes in a summary that "the sex of the flowers of Pinas densiflora is not determined by their morphological poritions on the shoot. The
sex is undetermined until a oertain stage of their development. A flower which will otherwise develop into a male has a tendency to beoome s female when local inorease of nourishment tates place at a certain stage, or during cortain stagem of its development."
These experiments corroborate those of \(\mathrm{MaO}_{1}\) who found that male plants repeatedly proned gave rise to female flowers. Others have met with similar results. Thus, Mr. A. Hrnay soooeeded in inducing the formation of fomale plants only by removing two out of the three stigmas of Begonias, and in fertilising by tho third stigma alone. Hoffyan experimented on diœecious plants by fertilising them early and late in the season and with fresh and del pollen; though his results were in some dym contradictory, one, however, was interemide. Experimenting with Lychnis vespertina, mich he regards as the same species with L . dioies (white), when the period of impregnation wh more or less delayed, it seemed to have an influence upon the colouring of the flowers. The "precocious" impregnation favoured the production of the rose tint, for the proportion of red flowers to 100 white was 146 male and 14 female plants. Of those impregnated late, the proportion was about seventy male and fiftr-vix female. This result tallied with that of CusRİREf, who found that by crossing Amaryllis vittata with A. pulverulenta and A. brasiliensis (plants with red flowers, being varieties, nok species), he obtained a very great quantity of red flowers like those of the male plants, some few only were nearly white. This reall followed from the impregnation by fresblycolleoted pollen.
How far florists experiment in this way mith fresh or old pollen we do not know; bel since different and important results followed on the above occasions in the oolouring of flowers, there would seem to be some opening for experiments in this direotion. With regard to the subjeot of the paper, however, on the origin of sex, further investigations are wanted to disoover, if ever it be possible, the immediato oause of sex.

Group of Cattleyas at Burford (mem Supplementary Illuatration),-Cattleyas are amoogth the most gorgeous of Orchidaceons plants, and highly appreciated accordingly. The centre plant of the group in our Sapplementary Illastration is the magnificent pecimen of Cattleya Lamrenceana, which was exhibited before the Orchid Committeo of the Royal Horticultural Society on April 9 of the present year, which was juutly awarded a Silver Flora Medal as a mark of good culture. Thin superb plant measared over 3 feet across, and boro thirteen apikes of bloom, the number of flowern oll the largent apike being eleven. It may be of wome interest to those who had the opportanity of observ. ing the plant when shown, to learn that at the pre sent time it is sending ap eighteen strong groithe with fifteen flower- hheaths, which promise well for s good show of bloom next spring. The caltaril treatment required by C. Lawrenceana is of the simpleat kind. Uacally the plant is late in atarimg into growth, and the bulbe are only half formed When the dull days of autamn are upon wid it therefore require to be placed in the warmeat and lightest part of the house, so as to complete ith growth quickly. This point is an essential one. Al regarde affording water at the roots, restiog, sen tho course to follow is the same as is found anitable to its congeners. To the right-hand of the illastrations is the delicately-tinted C. Schroderne, its amedro acented and perfect-shaped bloom of great attance tiveness. The left-hand apecimen is a nobbe lli, bat and grand variety of the popalar C. Mendeli, unfortunately the brilliant colouring of the lip cand be reproduced by photography.

Royal Horticultural Society.-The nezt meeting of the Fruit and Floral Committeer will be held on Taesday. Ostober 15, in the Drill Hall, James Street, Victoria Street, Westminster, at \(120^{\circ}\) Clock; and at 3 Pm a lecture on "Nat Cultare in England" will be given by Mr. J. Omer Cooper,

Gardenerb' Royal Benevolent Inbtitu. TION. -The secretary of this excellent gardening inatitation inform us that Mr. F. Miller, gardener to J. T. Friend. Eiq., of Northdown House, Margate, bas paid over to it funds the sum of 10 gaineas being the proceeda of an exhibition of two large American Alces or Agaves, flowering specimens, en mentioned in our columns.

Chrysanthemums in Southwark Park.We are requented by Mr. Curle, the Saperintendent of this new park, to state that the dieplay of Chrysanthemams in the conservatory will be opened on Satarday, October 12.

\section*{"Botanical Magazine."-}

Anthurium Gustavi, Régel, figared at t. 7437, is a New Gianadan epecies, with long-atalked cordate orate green leaves, 3 feet acroas, slender purplish colinaric spathes only elightly ahorter than the apadix.

Mormodes Rolfeanum, t. 7438 (see Gardeners' Chronicle, 1892, i., p. 203, f. 30),

Polugala Galpini, Hook. fil., t. 7439.-A very divtinct sarabby specien from Natal and Swaziland, with shortly stalked lanceolate hirtulous leaves and terminal racemes of pale rosy-lilac flowers. It flowered in the Temperate-house at K9w in 1874.

Tulipa violacea, Boissier.-A Persian specie with relatively mall red or violet flowern with filament hairy at the base. Kew.

Sternhergia Fischeriana, Romer, t. 7441.-Like a fiae form of S. Intea, but flowering in apring instead of in autumn. Kew.
"Introduction."-The name of Introduction has been given to a new journal avowedly devoted to "instruction, entertainment, and general nocial topics," and which is to be published every Saturday at 30, Newcastle Street, Strand. The contente are indeed light and miscellaneous, to judge from the firat issue of the paper, and among them must be momething to anit the tante of everyone. This variety is the more comprehensible and praiseworthy when we hear that the journal il intended for colonial and American as well as for European circu'ation.

Death of Mr. Andrew Jamieson. - The Kew Bulletin for September announcen the death at the General Hospital, Madraw, on August 17, of Mr. Andrew Jamieson, Curator of the gardens and parks at Ootacamund, Nilgiria. Mr. Jamieson was fifty-three years of age, and had been connected with the Ootacamund Gardens for nearly twentyseven jear. He was formerly a member of the gardening ataff at \(\mathrm{K} \theta\), and was appointed to Ootacamund in September, 1868, being in mole charge of the gardens on the Nilgiris for many years, until they were placed under the control of the present Director, Mr. M. A. Lawson, who apoke most highly of Mr. Jamieson's skill and perseverance in all his dutien.

Viola Conference.-The proceedinga of the recond conference, held at Birmingham, on May 29 of thi year, were daly noted in our columns at the time. We have only to mention that the complete repurt in nuw pablished, and may be had from Mr. R. Dran, Kanelagh Road, Ealing. The papers read and pablished in fall are the following:"The Genas Viola," by Prof. Hilliouse; "Oider Varietie of Violas," by Mr. Richard Dran; "Violae that do well in Sarrey," by Mr. E. Brarell; "Newer Varietie of the Violetta Type," by Dr. Stuart; and "Winter Treatment of Violae," by Mr. A. J. Rowberry.

Stock-taking: September.-The optimiat who, during the past year or two, exprensed continued confidence in the pluck and energy of his fellow countrymen, and in the return to common-sense vilewe of thinge commercial on the part of many of our
best cuntomers, has had, and is having, his reward in the increased revenue of the country, and the extension of trade. Thus, the increase in the Exchequer receipt for the first six months in the current financial year is placed at £3,916,837 over those for the ame period last year; the gain in the imports for September is represented by the figure \(£ 378,393\), the decrease for the nine month having been reduced to some \(£ 662.301\). Of the exportm, which make a fine show, more anon. Here may be given our usual excerpt from the cummary table of importa:-
\begin{tabular}{|c|c|c|c|}

\end{tabular}

Taking note of the word "Hops," in the general figuren, we are forcibly reminded of come changes going on in France, on the matter of viticulture. Within the past few weekn an English official travelling throagh Bargundy, was amazed to see long extending lines of Hop-poles; and on inquiring found that the wretched little vermin, the Phylloxera, had effected the tranoformation; the Vinen had been grabbed up, the planting of American stocks being too expensive, and the beautiful Hop plant substituted. A fine light ale, we are told, was manufactured for market; but one of the upper-class merchant of the diatrict insisted that our rejected Local Veto Bill would have to be introduced into the Chamber of Deputier, and passed into law! It is an easy atep from Vine cultare to our fruit, root, and vegetable imforty, concerning which we give the following figures for the month just ended :-
\begin{tabular}{|c|c|c|c|}
\hline Imports. & 1894. & 1895. & Difference. \\
\hline Fruits, raw : & & & \\

\end{tabular}

This is the most encouraging array of facte in this direction we have printed for yeara past, and they resd their own lesson. As to prices obtainable for the home product, an evening journal very recently reported, on the authority of a corrempondent, that a Somersetshire fruit-grower having sent on a ton of good Apples to a aleaman in London, received in return etamp for lens then a milling! Something wrong here, surely.

\section*{Exports}
descrve brief notice at our handa. The figures for the past month show an increase over those for Sep\(t \in\) mber lat year amounting to \(£ 1862,620\), the increase for the nine month pant being represented by the figures, \(£ 5,157,866\). This increase is spread over all, excepting three, of the classes usually pecifiad, and thene three are (1) raw materials; (2) metal and article manufactured therefrom; and (3) chemicals, \&c. It han been saggeated that we shall find a strong competitor for our Eastern trade in little Japan. The Japanere are taking ateps to greatly increase the outpab of coals, and to start a big thing in shipbuilding
and repairing. Surely, however, there is room enough and to apare among the Celeatials and adjacent countries. Formose will require a lot of looking after and expenditure, and as we learn that Cbios is negotiatiog a treaty of commerce with Japan, a plendid opening for everybody's export may shortly be found where twelvemonthesince no such thing was expected. We do not observe, however, that our export to the Esat are at present very much affected by our supposed competitor.

Canadian Fruit. - We are informed that arrangemente have been completed by which a firm of London hip-owners will convey Apples and all other fruits grown for commercial parpose in Nova Scotia, from that favoured colony, via the Shipcanal to Mancheater. By thil meane travelling expense may be lowered, and the price per barrel reduced to the consumer.
H. Witte.-Forty jears ago, on October 1, 1855, the well-known curator of the celebrated Leyden Botanic Garden, Mr. H. Wirtr entered into the position, which he atill occapies in perfect healtb, with the exception of deafness. Under Mr. Witta's management the Botanic Garden at Leyden has attained a very high atandard of perfection, and Mr. Witte is the friend of all the horticulturists, botanisis, and gardeners of Holland, and of a large number abroad, who appreciate him as a man, as the best Datch author on horticultaral abjects, and as a promoter of horticultare in all branches. On the 1st inst. a splendid banquet and concert was offered to the hero of the day, who had been complimented in the morning by the employes of the Butanic Garden, a reception held in the afternoon enabled the curator's numerous friend to congratulate him. The mayor of the City of Leyden handed the cross and ribbon of a knight of the royal order of Orange Nassau, a distinction which has never before been bestowed upon a horticulturist; the jabilee committee offered a valuable gift with a nice albem containing autographe of the subscribers; the old pupils applied a highly interenting album containing autographe, photom, and other ouvenirs of former pupile, who are now in all partn of the world: Profemor Subingar, the Director of the Botanic Garden, made a most cordial speech; the Luyden aection of the Royal Netherland Horticultaral and Botanic Society appointed Mr. Witte a honorary member; the Councils of this and other ocieties read letters of congratulation; and the new Tydechrift voor Tuinbouw pabliahed a special "Witte" namber, with an excellent portrait and extracta from the carator's oldest press work. In fact, it was a splendid featival, and a day which Mr. Witte and tho who were present will never forget.

Enalish Amber. - Professor Conwentz had nome interesting fact to state at the meeting of the British Association concerniag the formation of amber in different parts of the world. It seems that Baltic amber-succinite-is the most esteemed variety; whilet Eaglish amber, which is also ccinite, is found mostly on the coavis of Norfolk, Saffolk, and Esuex, and contains insectr, wood, Howers, \&c., which indicate the oldest Tertiary formations. From the fact that some apecimen of amber contain fragments of Mignolis and Cinaamon, it eeem: probable that the flora of the amber period was entirely different to that of modern Earope, Pharmacentioal Journal.

What our Friends Thinik of Us.-A diapatch from Loncon to the Sum, of this city, whates that this year there has been such an enormous crop of Plum in Great Britain that the price of the fruit has fallen to \(2 d\). a pound, which is mo little that it does not pay the cont of gathering and freight. One would natarally have sapposed that the grower would have made haste to dry the fruit, since Eng. land pays annually two million dollars for dried Plams imported from France. Eaglish farmors are extremely conservative, however, and they eat still and allowed the frait to fall on the ground and rot. It may be, that these Plum-growern can give some reasonable excuie for their failure to meet auch an
emergency. Farmera and frait-growers are often accused of a lack of enterprise, when in reality it is practically imponible to solve offtoand the problem which anddenly confront them. Garden and Forest.
"Everareen."-This is the name of a book inued in parts, and pablished simaltaneously in Edinbargh, London, and America. The eecond issue, now ready, is anb-titled "The Bjok of Aatamo," and, according to the prospectas, "will be divided into foar correlated parta: - I., Autumn in Nature; II. Autama in Life ; III., Autamn in the World; IV, Autumn in the North." Tae pablication is to contain biology, soziology, fiction, poetry, and other very diverse kinds of contribations, all from practised penf, and many of them illustrated. Farther information may be obtained from Patricie Geddes and colleaguer, Lawnmarket, Edinburgb.

Vegetable Products in porto Rico.Benides Sagar and CJffoe, both of which are intimately associated with Purto Rico, Tubaceo also holds an important position, bat though already cultivated to a very large extent, it is stated that ite growth might be extended almort indefinitely if it were not for the old question of excesaive taxation. The soil is of the very best for Tobacco growing, and quite equal to the best of the Caban plantations, bat as a rule, there is mome carelessness in the process of curing. Good Tobacco requires no great labour in its cultivation, bat considerable care and attention, especially an regards insect pests, and when the leaf is atripped, selected and dried. In all thene matters the native of Porto Rico is exceedingly careless, and this it is that preventa so good a final product being obtained as in Havana. Still, a considerable quantity of Porto Rico cigars find their way to the States, Spain, France, and Eogland; bus the Tobaceo trade is one which ought to be largely extended, if only proper facilities were given by the Government. Large quantitien of Tobacco-lenf are exported to Caba, to be made ap there into the world-famed Havana cigars. On the subject of fraits, it is aid that, though the Plantain, Banana, \&c., are grown everywhere, and are much used so fruit in the country, the export trade is not large, nor yet of the Pine-apple, which grows to perfection when any care is taken of it. It is remarkable that the Pine-apple is not exported in larger quantitiea than is actually the care, seeing that it is a fruit that could easily be bhipped and carried the short distance to the United States, where it can command good prices. The Cocoa-nut grows in immense quantities all around the coasta of the island, and to a considerable diatance inland, bat little or no use is made of it, and exports are few and far between. The content of the green nut are mach used as a beverage, but the great bulk of the crop, which has a centinuous growth, is allowed to go to waste. The Mango, covered with its green and golden frait, is common everywhere, and lines the roadsides in many parts for miles and miles. The Seville, or Bitter Orange, grows wild in the woods, but none of the frait is exported, and by far the greater part goes to abolate wate.
"dictionhaire Paatique de l'horticul. tune."-This has now reached the lettera Ner. As an illuatration of the care taken to bring this valuable work up to date, we may instance the article Musa, which embodies the information recently pablushed in the monographs of BaERE and of Morris.
"Hanobook to the Flora of Ceylon."Df. Trimen's mort aseful handbook makes ateady progress. The plates by which it is illuatrated now namber seventy-five. Barleria Arnottiana, with large tabalar blue flowers would be a desirable introduction to our stoves. The text of the third volume has now resched the Balanophoracea. The terse descriptive paragraphe admitting ready comparison are in marked contrast to the diffane diasertation admitting of oomparioon with diffeclelty if at ail which arre emplojed by the laboratory if athool of
botaniste.

Cedar of Goa.-Among the various conjecture as to the origin of this Caprennus, in one that it may be of Chinese extraction, and that it was taken from Macao to Goa. To obtain information on this point, we applied to Mr. Tutcaer, of the Hong-Kong Botanic Garden, who kindly informs us that from frequent, and, indeed, quite recent visits to Macao, he is able to nay there are no spacies of Capressus caltirated there now, and none wild in the immediate neighbourhood.

The Temperate-house at Kew. - The erection of the south wing of the Temperate-house was sanctioned by the Treasury last year. The care required in the preparation of the detailed working drawings, and the secaring the necesmary contracts as coon as the supplementary estimate had been passed by the Houss of Commons, prevented the work being immediately taken in hand. The contractor, however (according to the Septembar Kew Bulletin) commenced work on the fite on August 19, and bailding is being pashed on with all possible speed. It is hoped that the new wing will be completed by the middie of next year.

Wire fence at Kew.-The permission of the Queen has been obtained for the removal of the fences, exclading the public from the Palace Meadow, and since then, according to the September Kew Builetin, the First Commintioner of Her Majesty' Works and Public Buildings has anthorised the removal of the wire fence which since 1844 has separated the Botanic Garden from the Arboretum. As for many yeara there hay been no difference in the administration of the two areas, which are equally devoted to botanical parposes, the fence had become devoid of any practical object; and the four gates by which alone it could bs passed had become wholly inadequate to the convenient movement of the large crowd which now frequent the Royal Gardens in fine weather.

Pay of Kew Employes.-The Kew Bulletin for September says, that on the recommendation of the Firt Commianioner of her Majenty' Works and Pablic Buildings, the Treasary has agreed to the minimum wage at Kew being raised to 218 . In addition to this, both labourers and gardeners receive gratuitous medical attendance daring sicknean, sickpay according to length of ervice, and extra pay when employed on Sanday. On the other hand, retirement at 60 is compulsory, and pensions in the shape of "compasnionate allowances" are abolished by the Saperannuation Act, 1887, which only allows a gratuity of one week pay for each year of service. It will be interesting to trace the gradual rise of wage at Kow nince 1841, when it became a national establishment:-
\begin{tabular}{|c|c|c|c|c|c|}

Isish Agricultural Statistics.-A Report has been publiwhed containing abstract from Irish Agricultural Statiatics, thowing the acreage under cropn, and the number and deacription of live atock in each coanty and province (in 1894-5) ; also report from the mperintendents of enumeration upon the atate of their crops in their eeveral districte at the time of the collection of information for the retinme. There statiatice, published by authority of the Government, should prove of great uee to agriculturista, both present and future.

APPLE.-A correspondent rends ue a ripe Apple with a mall flower growing out from ita ide. \(O\) : courge, there is nothing, very extraordinary in the
presence of a flower in that situation, at thas may be accounted for on morphological and anatomieal reasons; the difficulty is to account for the lese production of the flower from a fruit already ripe.
"The Pig."-The first book of a series to be published under the above name has appeared, and is devoted to "Rational Pige keeping to enaure Prolth" The author is Mr. W. J. Maldens, and his prection and well-arranged treatise deserve every atteation from those interested in this subject. The pablimp is Mr. William A. May, Farm, Field, and Muily Uffice, 1, Easex Street, Strand, W.C.

New Books:--Index Kewensis,-We hen announce the publication of the fourth and last puta? thim monamental work. The gratitude and ajmputb? of all workers in botany should be extended to lif, B. D. Jackson, Sir J. Hoorbe, and othem, connected with this usefal pablication. Kenal' Botany.-This work is now completad under the editorship of Professor F. Oliver. We have alluded to it in its course through the press, and ith completion will give us another opportanity of referring to it. Two other books lie of our table, and will demand early notice, vim Rev. G. Henslow's Origln of Plant-strudwe, a fascianting and angestive book; and Mr. G. Murray's Introduction to the Study of Sen weeds, a book for which there wat a great need, w great has been the progrers since similar wotkham been pablished. Mr. Burberry has also publiaheds second edition of his Amateur Orchid cultinaton' Guide-book.

New Publications.-Ten New England Blom soms and their Insect Visitors, by Clabence M. Wro. (Pablished at B ston and Now York, by Hovariver, Mifflin \& Co, The Riveraide Press, Cambridge)Analytical Key to the Natural Orters of Flowaring Plants, by Hranz Thonner. (London: Smay Sonnenschein \& Co. New York: Macmillan\&Ca. -Insects and Insecticides, a practical manual concerning noxions insect and the methods of pre venting their injaries, by Clarence M. Werd, D.Se (New York: Grange Judd Co. London: Kway, Paul, Trenci, Trübner \& Co., Paternoster Houm Charing Cross Iind.) - Les Engrais Les Fo. ments de la Terre, by M. P. P. Dehérain. (Parii: Robere er Cie, Editeurn, 106, Boulerard Suint Germain.) - Handbook of West Amorican Come.barmin, J. G. Limmon, Oakland, Cal.s third (pecke) edition.

\section*{Book NOTICE,}

Das Trochnen und Farben Natualchir Blumen Gräser, Etc. By. Heinitle Hein; published by B. F. Voigt, Woiel (2nd edition).
We have, in this manual of 163 pager, full direco tion in the German language for bleaching, dyeive, and drying nute, fruit-carpels, eara of corn, pull leaves, Fern-fronds, flowers, grasues, reedi, rulteh \&c., and the preparation of natural materials or in making of bouquets. We are accustomed to at a few hop in London and other large cowie of Chriatmas-tide and other measons, quasy, Fart coloured or bleached grasses, Palm leavel, 8 , fronds, tree leaves of varions apecies, yashes, din but few permons are acquainted with the metioure pre which these charming decorative objects are pared, and to mont gardeners and floriats kno remain the clonent secret. And the littio put on ledge which some have acquired is seldom parad. any useful commercial purpose either here ory be tue This absence of enterprise or initiative mis tho to the extreme reticence on the part orstete and have mastered these method of manuracurest of the carefally-guarded manner in which the en appesp the trade are kept by them. Previons to the cisted, es ance of the firat edition of this manual, there carc carpe we learn from the preface, no book whics ghan rofs tent instrictions, and the booksellerl krien
that coald eupply the information that was lacking; but the businees begen to grow, and in certain directions wholesale manufacture wes being carried on-a few succeaful stabiishments existed in the suburbs of various towns which are the centre of horticultare in Germany, which tad laid the foundation of their present celebrity. To-day the basiness of preparing materials for, and the manufacture of dried bouquete and other objects is an important one in Germany, and seeme likely to extend.

The firat part of the book consint of an enumeration and concies deacription of the methods of cultivation, time at which to gather the bloome, and other encential information of those fowering plants found uitable for drying or bleaching, and dyeing, beginning with Composifs, Acrociniam roasuas being the first plant taken; theu Ammobian, Antennaria, Helichrysum, Helipterum, Leontopodium, Rhodanthe, and Keranthemum. Then come flowers which are not immortelles, inclading Delphininm, Pansy, Dianthan, Hollyhock, Sweet Pea, Koses, Atrantia, Eryngium, annual Anters, Daisies, Meadow Sweet, \&nnual Cbrysanthemum, Zinnias, and many more. The same plan is followed with grases and rushen, and this part eems to us a very uneful one, these plants affording graceful materisla for forming winter bouquets, mixing with flowers, either dry or freshly gathered, and other devices. The drying and colouring of mosses and moss-like plants also meet with satisfactory treatment. The aecond part of the book is taken up by the technique of the preparation of materinls; a description of the required apparatua and appliances, and the way to use them. In this rection the anbleaching method is fully described, and the various plants alluded to which can be subjected to it. All the various coloar and the various modes of prepariog them are concisely described in the last section. The manual is farnished with \(16 \%\) wood. cuty, and an excellent index, which meet all reasonable requirements. To those pernons, male and female, eapecially the latter, who are deairous of engeging in businese of a remunerative character, not involving hard manual labour, thim modest manual applies much valuable information, which they can pat to practical purposes at a mall coat. Hitberto most of the dried bouquet material sold in this country has come from abroad, but as nearly the whole of the plants mentioned are capable of being cultivated in this country, and some are indigenous, that should not be tolerated much longer. An English translation of Herr Hein's book hould meet with a ready ale in this country.

\section*{SUCCULENT SEEDS}

Every now and then we receive specimen of ripe Grapes the skin of which barate open to liberate a second eupplementary Grape formed in the interior. Having previouly only seen auch Grapes in the ripe condition, we had ccasidered them to be the realt of the formation of flowers within the original ovary, auch as occasionally happens in Crucifers. This aeason, however, we were privileged to receive specimens in the unripe stage, and the inspection of the berries in course of formation soon showed us that our previous codjectare was quite erroneous, and that the applementary berrien are in reality seeds whose coats had become fleaby (see figs. 76, 77).

This auculent condition of the seed-coat occurs in the nearly-allied Leontice, in Crinum, and nome other planta, as long since recorded by Robert Brown. An analogous change take place in the carpele of Rona eymnocarpa, but here it in the cont of the ovary that becomes succulent. The point now to be ascertained in the cause of thi production. Does some idjary occur to the berry, cauning it to crack? and doen the seed become fleahy in consequence of exposure? or does the seed-coat swall up firat, and by its force of growth cause the resisting coat of the berry to crack open?
As the subject if of much botanical intereat, we append the eccount of Robert Brown:-- In Leonfice the "drops etipttatia' of Michexx in 'in reality a
naked seed that in a very early atege had burat its pericarpiam." "In Pelionanthes Teta, soon after impregnation has taken place, from one to three of these ovula rapidly increase in aize, by their preandre prevent the development of the others, and rapture the ovariam, which remain but little enlarged at the base of the fruit, consiting of from one to three naked berry like aceds." Robert Brown, "Oa some remarkable Deviation from the asual Stracture of Seed, and Fraita," Trams, Linn, Soc. London, vol. sii. pp. 143, 151 (read March 5, 1816); The Miscellaneous Botanical Works of Robert Brown, vol. 1. (1866), p. 361. M. T. M.

A ROADEIDE HOUBE GARDEN,-A charming floral effect might listely be seen at the "Joha Bull" inn, opposite Gannerubary Station. A balcony rans along the length of the house, and thi has been utilised to produce a very pleasing effect indeed. A dark-leaved crimson-flowered form of Tropmolum Lobbianum, growing in pots or boxes, falls down over the front of the balcony in numeroas graceful festoons, and has also grown apwards, and reached some dietance above the balcony railing, finding adequate sapport there; while varioui planty in pots, anch an Felargoninm of different typas, Petro
nias, Fuchaia, \&e., varied the arrangemeat, and furnish attractive patches of colour. It in pleasant to notice, as can frecquently be done, that wayaide pablic-housen are met with in the noburbe of London decorated in this way, and there is no reason whatever why Boniface ahould not be a gardener as well an a licensed victualler. It may be saicely asamed that pasaera-by would atop to acmire and probably drink a glass of something in compliment to the flower-loving pablican, \(R\). \(D\).
the naming of sweet peas and robe 8 BY THEIR PERFUME8. - I wan much interested by Mr. Hartland's note on this subject in a recent isue of Gardeners' Chronicle, and glad to hear that Enily Henderson, one of the beat white Peam, bad the least acent. The majority of our Sweet Peas, unlike gur Roses, are overladen with odourr, thelat!er can be tasted an well as smele, and much yood honey is ruined annarlly throuph the fulsomenes of Sweet leas. For this and other reason, such an the avoid. arce of headaches, it may be hoped that Mr. Hartland and others will tarn their attention not only to the naming of Sweet Peas by their acent, but to the reduction of the amount of the odour, or a change of their perfames. As to Koses, it is many gears ago when I first undertook to name some of theae from their odoura-notably, if I remember rightly, Devoniensis, the old Cabbage, Maiden's Blush, Boale de Neige, Maréchal Niel, La France, Chas. Lefebvre, \&c. In my addren to the Horticultural Clab at the Hotel Windsor last year on the odours of Roses, reference was made to those early attempta at classification and recognition of the perfumes of Romes. The time is never likely to come when we chall say of these, many have long been saying of the acent of Sweet Peas, "Hold, we have already more than enoogh." D.T. Fish.

OUT.OF-DOOR GRAPE VINES IN TOWNBPatsing along one of the main atreets in a provincial town the other day, I found a jobbing gardener trimming a Grape-vine. The Vine was apecially healthy and fruitful, and was furniahed with a all crop of good-ized, well-furnithed bunches. As a mere wall-clother and a welcome relief to a long ran of bricks and mortar, it was equally or more ornamental than the Ivier, Ampelopais Veitchii, or Virginian Creeper that were almont the only climbers brought into competition with the Vine. The leading shoot of the Vine had been carefolly tied-in, the laterals atopped several weeke since had broken again into ab-laterala, and not a few of the latter had broken into sub-laterale and tendrils, the whole having a rich and gracelul effect. The gardener was thinning the latter without wholly removing them, and the fffect of the bunches, foliage, and tendrils was mont promising and refreshing. The autumnal tints of Vines, to say little of the beauty of the fruit in bunch and berry, are also very charming, and many varietien of Grape-vines are worth growng an an ong the very richeat and choicent of fine-foliage plante. Even Lady Downes, West's St. Peter's, Alicante, and many others, that could hardly be expected to ripen their fraite in the open air, can ripen and colone their leave to the greateat perfection on southern and western and other aspecte; while among our very old-fahioned and hardient Grapes, that ripen their fruit in the open, as well as form ons of the richest contrast with their leaven, we have the Dasty Miller and the Claret, the latter finiahing in a glow of crimaon bardly matched by Virginian Creeper, however brilliant. Bat I have often advocated the use of fruiting and American apecies of Vines for the colouring of gardens, buildings, landscapes. The object of this note is chiefly to recommend the thinning of auch fine banches as I waw in the atreat the other day. Many of theme everaged the length and size of average Hambarghe; and were they but moderately thinned, they would donbtless reach to average size in the two possible growing month set before them. Already the bunches are so crashed an to move in masney. ounches are other berries are intruding each other in the fierce truggle for room. People tell us that for wine-making-the final goal of mont out-of-door Grapes-it matters little; but it doen, and thinning would pay even for thin, as, weight for weight, far more wine is preased from good-aized berries than a huge crush largely composed of dry skion and hard atoner, with a minimum of ithoh and juice. Besides, in favourable seasons, under favourable culture, and especially through liberal and timerly thinning, many Grapes may be ripened nufficiently in our climate to prove relreshing and tnjovable. Thouande of pounds are eaten, though jammed and crowded into molid mane through the energy of
growth, with only the mere exterior of the berrien ipe. With the entire bunch ripened to a similar extent through the thinning of out-of-door Grapes, the value of the crop would be doubled for winemaking or conversion into temperance drinks, and maltiplied many times for eating. \(D, T, F\).
defective arrangement in the arape Clabses at the Royal Horticultural Society's Fruit Show at the Cryatal Palace. I hould like to know why tables were not provided sufficient in size to hold the three exhibits in class 3 without making ane of a side-table for one of them; and why the udgea' attention was not called to this exhibit by he officials before the judges made their awards, ad why it was left to the exhibitor himself to call the officers attention to the overaight? Again, why did one of the cfficials make a suggestion that the xhibit thould have a 3rd prize without the jadges being called back? I may ary that the judges did judge this exhibit, and after a cursory glance at it awarded a 3rd prize. The ame kind of mistake occurred in class 4, but on the exhibitor calling the official's attention to it, the judges were brought back and they reconsidered their original awards, and gave it a 2 ad prize in this class. Is it usaal for judges to look at the address card when makiog their awards? John Cariill, 83, St. John's Road, S.E

CRABS.-Crabs are generally conidered to bo pither a wild or a cultivated kind of sour Apple, and in Kent, not so long ago, after making the cider, the droas, or crushed Apples, was thrown away some distance from the bouse, an it was conadered an lacky to have it anywhere near. From this not unfrequently hundreds of eepdings arose, and these were always called "Crabs" and uaed for stocks. when posnibly there was not a true wild kind, or sbarp acid Apple among them, and no it was that nccaionally, if the stock and core grew as well as the iciov, two kind of finit were on the ame tree I have zeen, jeara ago, a "Ruste" on the part Erowing frcm the stock, while the scion was the old Nunsuct. But it in not of this mode of raising atock I parpore writing, but of the value of the "Crab" as an orumental tree, both in flower or fsuiting. Generally small, light, and not ongraceful in growth, Crabe present at all times a plasing apect, but in epring or September, some ar besutiful in the extreme, and are well worthy of a phace in every garden of any eize or pretentions for feorative purporef, and as such I have used several f the varieties pith much eatisfaction to myself and to the delight of my friend. Few perple are awar for this parpose how very usefal it is. Of the kind to use. For flowers only, Malas floribundais charming in March or April, then there is a larger-fruited varicty of this worth growing. On this follows closely, Chicago, deep yellow with red cheeks Marengo, large fruit, red or yellow: Zeller, a fine colour and good bearer; as is the Yellow Siberian The Scarlet or Cherry I do not like so well as some. Oblong is one of Mr. Rivers' bright and showy Then of the maller kind, is efulis, an abundan bearer, but uneatable. From Mesart. Cheal get Ringo, a fine sellow, bat amall; and a lovely bright tranaparent acarlet of the Cherry size with a sharp acid flavour, and fine for jolly, this is Cheal's New Scarlet, and is an acquinition. A trille larger is the old red Siberian; then the larger and oblong bright coloured John Downie; larger and brighter atill is the beautiful Transcendent Crab, a tree of this, carrying a large crop, is a marvel of beanty, the fruit has much the flavour of the mall wild Apples one nometimes find in the out-of-theway hedgerowe, and want more sharpness for good jelly-making. Then the deep rich blackith-purple the Black Crab, very handsome both in shape and colour ; and last, not least, the glorious Dartmonth Crab, and when the crop is good and the season suitable, this possibly is unsurpassed, presenting as it does gorgeous appearance, and that of a momewhat deceptive character, being often taken at firt glance for a Plam tree hang about with rich coloured Plamm. Bat all having some peculiar merits of their own, it is difficult to decide which to choose, but take any, or take all, and acatter them about the shrubbery, and the renult, if judiciouely done, will add both beauty, and be also of ume for table and other decoration, and for culinary purpowes. There may be more than thowe named above, but I think I have given sufficient chace some of which I grow, others by Mr Pi choice, for weveral I am indebted to Mr. Rivere, and Crawley, who have kindly aent me to dre. Cheal of of the frict from tres noty in me to dencribe som Woip, Setemoak.

WORM-EATING 8LUG8.-The prewent month is one of those during which the carions worm-eatiog slag-Testacella-leaves the subterranean tunnel of its victims and coming above ground may often be found under loge and stones, in the neighbourhood of rich soil. The animal is easily recognised by it exceptionally leathery akin, and by the presence of a ting external shell on the hinder end of the body recalling somewhat the nail on the end of a human finger. The writer would be greatly indebted to any reader of the Gardeners' Chronicle who could send him specimens of these slugs (from any locality, and preferably alive, or preserved in alcohol), as the in formation al to the distribation of the animal in till canty. Wilfred Mark Webh, Editor of the Journal of Malacology," "Holmesdale," Brentwood

\section*{ROFAL HORTICULTURAL.}

Great Exhibition of British Grown Fauit at the Crybtal Palace.

THIRD DAX'S CONFERENCE.
Mr. Philip Crowley, the Treasurer of the Royal Horticultural Nociety, presided at the third day's ouference, when Mr. Weathers, the Assistant ecretary of the Royal Horticultural Society, read

\author{
The Commeretal Aspect of Hardy Freft
}

The writer said, that in consequence of the agrinltural depression and the difficulty of making the had beeu at a loss to know what things they should row in the future with a reasonable prospect of a fairly remunerative return on their investments. Eoreigu competition was undoubtedly a serious matter, and must be deliberately looked in the face by present and future fruit growers. We must all make up our minds that unless we improved on our present system of culture generally, also in our methods (or want of method) in packing and marketing fruit, foreign competition would become even more keen. It seemed strauge that a practical and energetic nation like the British should have per mitted foreigners to step in, and in a measure monopolise their own markets with produce that could be grown better in every respect-except perhaps as regards colour-at home. At the same time it should be fully understood that cultivation must be thorough, not simply sticking a tree in the soil and expecting it to grow aud produce full crops every year without any further attention.
The fruit grower of the future must be a mau ho has had a proper education in the work; a man of untiring energy, with good business habits, and sufficient capital both to purchase his stock, and also to wait until they arrived at a bearing state. Or failing such men, capitalists could step in, buying the land and the stock, and employing a competent man to manage the business at a fixed annual salary, plus such a commission on sales or profits as migh be mutually arranged. It was of the utmost importance that only a manager should be employed who could bring positive proof of his training and abilities at a fruit grower, otherwive what might be a most remunerative investment would in all probability prove the reverse.

The question was frequently asked why skilled professional gardeners did not take up fruit growing as it paid so well, instead of being content to remain as gardeners. The answer was, that comparatively few gardeners had the needful capital to enable them to do so. Some more fortunate ones did do so, and usually made a very good living.

After dealing exhaustively with the question of land suitable for fruit growing, the writer went on to speak of the fruits. Tbe APPLe, he said, might be termed the King of British fruits, and looking at the enormous importations, there was no fruit holding a better prospect of profitable return. The soil of the United Kingdom was so admirably suited for Apple growing that if the cultural requirements were brit given proper attention, we could more than hold our own against the world. But to make the cultivation of Apples the commersial success it deserved to be, we must radically alter our present system, or rather want of system, by growing the trees better, and exercising more
honesty and care in sorting and packing the fruit The most profitable system was to grow a limited number of varieties as dwarf trees on a soil which had been proved capable of growing full crops of arge Apples. The first and most importaut advantage of dwarf trees was the quick return given by such trees as compared with standards. Some years ago the writer planted a number of Lane's Prince Albert costing 3s. a tree or 101 . per 100. They were planted at the end of October or early in November in well prepared situations. The following season a few Apples were produced, but the year after, i.e., the second year from the time of planting-a crop was borne and sold at 228 . pe cwt. and averaged \(3 s .6 d \%\) per tree. Of course, thet was an exceptional case, but it proved what could be done by planting dwarf trees carefully in suitable soil, with proper mauagement afterwards. The trees had continued to bear heavy crops of frnit in almost every subsequent year. Another advantage possessed by dwarf trees was the ease with which all operations connected therewith could be performed from the ground level as compared with standards which required ladders, etc. They were mach less injured by gales than were high trees from which Apples were blown down and spoilt for market purposes. Another advantage was that all malformed fruit could be plucked from the tree while small, so that when the fruit was gathered it could be put straight from the trees into the hampers with rery little sorting, and fastened down to be sent to market at once. The less fruit was haudled before reaching the purchaser the better its appearauce and the higher its value. By thus gathering the fruit and putting it into the bampers as picked there was no attempt at deception, as throughout the package. Buyers quickly noticed this honesty, and the sender acquired a reputation that made his consignments eagerly sought after The practice of topping the package with the finest ruit, with a mass of iuferior stulf beneath, could not be too strongly coudemmed.
Having decided on the form of tree to be grown, it was important that early orders should be given to a nurseryman of the highest repute, who would not permit a bad tree or one not true to name to the stock ursery. Another important matter was standaris the crabs aud stocks raised from Apple ips were the best, while nutbing would equal the Anglish or broad-leaved Paradise for dwarf trees.
Among the most protitable varieties to be grown were the Ecklinville, which headed the list, fetchug from \(£ 12\) to \(£ 22\) per ton; Lane's Prince Alberth itto: Golden Spire, realising about £15 a ton Worcester Pearmain, from \(\dot{1} 14\) to \(£ 26\) per ton; Varner's King, £16 per ton; Cox's Pomona, Cors Orauge Pippin, King of the Pippins, Lord Suffiela, Pott's Seedling, Yorkshire Beauty, Stirling Castle Tower of (rlamis, aud Dumelow's Seedling.
Pucss come next to Apples in giviug profitable cturns when they are growu upon bush trees. had ate years one heard much of growers whey not ound the price of Plums so for the picking, the fruit being in consequence eft to rot on the ground. This clearly showed to
 the fruit nuust have been small, the varieties in ferior, the soil and situation unfavourable, or the system of marketing stood in great need of im. provement. As a proof of this, one season, whices the wail was particularly loud as to the lo pfil6 prevailing for Plums, he had a gross return of buth rom one acre of Victoria Plum way. The lowet trees, planted at 8 feet apart each way. price he had made in the past ten years for Vic.
per cwt. and the highest 24 s. per cwt. The trees torias. Frost might occasionally cause take one year with another, Plums were well entitled to ranl next to Apples for profit. Among the profitaides varietics were Victoria, Rivers' Early, sometim 27 s. fetching 2Js. per cwt., and Czar, as high araring Earnest attention should be paid to the market of Plums; and in preparing them for the out and they should be properl packed in separate lots.
The Pear-a delicate fruit-was always in the least fair demand, and many imagined, Ho leading high prices ticketed upon them inent profit muat be made by the growers. His experience only in pro no hardy fruit was more uncerta Pear cultore ticularly favoured districts could pear. In ancu onsidered a comeroial success at all.
localities there was no question that Pear-growing would be a source of profit. Among the profitable varieties were Louise Bonne, which had fetched 14 s. per cwt. ; Beurré Clairgeau, 15s. per cwt. ; Clapp's Doyenué du Comice ; Marie Louise d'Uccle, Josephine de Malines: Catillac, Uvedale's St Cermain, Verulam, and Vicar of Winkfield.
The foreign Cherries were so poor in quality compared with homegrown ones, that there was every prospect of this popular fruit maiutaining its value and paying well in the future. The impurtance of growing only a few varieties of any kind of fruit held good with Cherries more than with any other kind because of the tronble with birds. For this reason, only one variety, or varieties which all ripened at the same time, should be planted in an orchard, this enabling a man with a gun to guard the fruit for the comparatively shor time it was necessary to protect it. Fixed object to scare the birds were of little use. Early River: held a high position among the early varieties then came Elton, (fovernor Wood, Florence, and Emperor Francis. There was a possibility of
making a fair profit by planting Morello Cherries.
For a man with but limited capital, bush fruit and Strawberries offered the greatest prospect of commercial success, as the first cost in purchasing them was comparatively small, and under fairly good treatment quick returns were secured. N fruit would pay so quickly as Black Currants, where they would grow, prices never being lower than \(\mathfrak{f 2 2}\) a ton

Red Cerrants were not in great demand.
White Currants must be very fine indeed to fetch good prices, and it would be rather a risk to plant any quantity

Raspberkies were a profitable crop, but pickers could not be engaged in the district, cou siderable loss might occur, as the fruit rapidly spoiled if not picked when ripe.

Gooseberries were a reliable and profitable fruit and ought to be planted on every fruit plantation o any size, as they come into bearing early from the time of planting, and proved of great assistance meeting expenses.

Strawberrikn. The price went up, and there was no reason why Strawberry culture should not give \({ }^{\text {as }}\) good a profit in the future as in the part.
The writer dealt with the question of the care and discrimination requisite in packing, and said finest fruit should wever, under any circumstances, be permitted. Perfect honesty in marketing was the best policy

As to insect foen, more attention to this matter was imperative to make fruit culture profitable. These pests should be dealt with early, as it was much easier to destroy them in their infancy.
Mr. Jonn Wright, who was one of the adjudicators on the prize essays, said that the paper they had listened to was at higbly valuable one. He and Mr. Barron (the Superintendent of the Ryal Horticultural Society at Chiswick), and the Rev. Mr. Wilks (the Socretary of the Society), had a heary responsilility placed on them. As they had heard, the writer indicated that the subject of fruit culture was a far
too serious matter for anyone who had but a little mones to too serious matter for anyone who had but a little money to take up, without tochnical knowledge to carry it through: practical man could be put in charge, the work would give a good return for the labour and capital invested. If they read this paper and the other prize essay which would be published in the Society's Journal, they would have in a small compass the most valuable production, the most sound instruction, and the safest guide on the subject which had ever appeared in the English language. He himself knew something about essay writing and the worries it entailed, and he had the pride and privilege of wearing the golu
medal given by Dr. Hogg sometime since. Although Dr. Hogg had been precluded from attending that meeting, that gentleman had anthorized him to say that he would give the large silver medal of the Journal of Horticulture to Mr. S. T Wright and to Mr. Lewis Castle, the writers of the Essays Mr. Lee Caypbell said he was very proud to tell them that by careful work on the part of his gardener and himself, he haul risen to the top of his profession. He started fruit growing as an experiment, but after a very long residence on the Continent, he was sure that wo were far ahead of the foreigner. He was, however, sorry to say that the foreigner had got more than the thius end of the wedge in, and he was afraid it would take a great deal to drive it ont. Whether wo could ever succeed thoroughly in that direction was doubtful. He had proof that our English fruit was not inferior in any respect to fruit produced abroad. A short time since he wrote to his salesman, Mr. John Mills, of Manchenter, askiog him to give him a faithful and candid opinion of how his frait compared with that of the foreigner. Mr. Mill wrote that his virieties of Apples realised 30 per cent. more on the averace than any other English Farietien, Now so
per cont. Was a profit in itself, at least growars thought although, perbups, shopkoepers were not coutent with it.
Recently they had gone almost entirely in for barrels for Recently they had gone almost entirely in for barrels for
convering frult. They thought this wis
 to the old style, as there wana certhin mavement in the thate. damaged it. They 1 nat bet ween ... :thi 60 lb . in is barrel. Mr. Mills also told him that hix J'asomid - Nomach
The question of foreigne minnetition, he heh, was a nathomal matter, and the subject of railway rates and the preferential rates given to the foreigner by our Euglish companies, woul. have to, be seriously gone into. As an instance, be mentione. that in Imerica five guineats a ton was charged for transit for a distance of 3,500 miles; be paid the Great Western Hailway Cos. same basis as Oranges were carried in America, the freight ought to bo about 4s. Owing to the milway companies' high charges thoumands of tons of fruit had to rot, as it would not pay to phace it upon the train. The Fronch Apples had an ad wantage over the English Apples between Southamptus from and to tae same places, showed a preference in favour "if people against indiscriminate planting. which would only the makiug a rod for their own hacks, and, like indiseriminate makiug a rof for in African mines, would make the victims wish dabling in Arrican mines, womd make
they had never taken the matter inn hand.
Mr. Gronok: Gondos said we should be a great deal mor Mr. Gronoz: Gondos said we should be a great deal more it might not be pleassant to Englishraen to confess it, the French cultivators were far and away in mance of us. The English method really spoilt the fruit, which presented any thing but an attrantive appearance when it was finally shovelled into the customer's basket. Then again, if we were to take full advantage of our opportunities, we should bs able to utilise our fruit in seasons of plenty by drying and preserving. There was no necessity to rely on the sun for preserving. there was no necessity to rely on
drying-that could be done in an ordinary oven.
The Chairmas mentioned that he had dried his own fruit The Chairman mentioned that he had dried his own fruit
in the wen, which answered satisfactorily. There were, however, two kuod Irying-machines - tho Mayfirth and the Wass one of which was at Chiswick Ciardens, where it might lre inspocteri

\section*{NATIONAL CHRYSANTHEMUM}

Ocroiser 8, 9, 10 -Mure than usual auccens attended the early sutumn show of the National Chrgannthemam Society, held on the above dates
in che Royal Aquarium, Wentminater, The quality of many of the bloome exhibited was very bigh, and almont equal to those gene-
rally ataged at the November meeting. There were ome new varieties presented before the Fioral Committee, and several Certificates were awarded. Competition in the open classes was generally good, but in the limited clanse rather weaker. The show gained much of it effectivenes as a diplay from the very \(x\) umerons honorary collections of flowers and fruits from the trade.
There were two exhibitors only of a group of Chrysanthe mum plants in flower, arravged with foliage planta for effect Mr. H. J. Jones, Ryecroft Nurseries, Lewisham, was ist. H Ftaged a good lot of plants and placed them thinly, with a few Yerns in iront and intermized, and a background of Bambusa Varieties most interesting were the new Mrs. Chas. E. Shea one of the first rate Japanese blooms of last year; Mra. \(\mathbf{R}\) Jonee, Litiere, A. H. Fewkes, \&c. The colour of several of these was rather deficient. The 2 nd prize was taken by Mr Howe, gr. to Hexry Tate. Esq., Park Hill, Streatham Common, who had a group consisting of Chrysanthemume with Dracsenas, Crotons, and other things.

For twenty-four Japanese blooms in eighteen varieties, Mr W. Wells, nurseryman, Redhill, Surrey, won lst honours, and his collection was capital, indeed, for this early show Among the varietias, the most noteworthy was Boule d'Or, an incurved variety of the present year, sent out by Calrat. A shown, the bloom is large and fairly full, petals broad, and the colour a pleasing shade of buff. A First-class Certificate was awarded. Wm. Tricker, Frank Wells, Eda Prass, Loaise (very good), Madame Ed. Rey, were all of good quality. 2nd, Mr. Chne. Cox, ET. to Jwo, Thotter, Eeq., Brickendon Grange, Hertiord whose collection had slso very exceptional blooms. W might mention Avalanche, Mrs. Anna Hartshorn, Preoide The beat twelve blooms (Japanese), distinct, was a doren from Mr. R. Jonez, gr. to C. A. Smita-Ryland, Heq., Barford Hill, Warwick, who had blooms of excellent quality. Mons. Chas. Molin, which was awarded First-clase Certificate as shown by Mr. W.J. Godfrey, was represented in this stand by a first-class bloom; Madame Ed. Rey, Mra, E. G. Hill, Wm. Seward, Fose Wynne, M. Panckoucke, were other that com Beward, Bose W
In the 2nd prize collection, from Mr. Jas. Brookes, gr. to W. J. NEWMax, Enq, Whetstone House, Totteridge Lane, N., were nice blooms of good colour, representing the newe varietien; Mr. W. ColliNs, gr. to J. W. Cardice, Keq. Pombourne Parl, Hertford; wat 3rd; and there were seven o eight other exhibitorn.
Ex blooms of incurved distinct oniy found two exhibitor
and Mons. Bahuant; Mr. R. Filkins, gr. to Mi:n Aletander, Oakbank, Chislehurst, was 2nd.
and the best were from Made of twans. Brown. br. of Pompone, and the best were from Mp. Chas, Brown. gr. to R. Henty Esq., Langley House, Abbots Lapgley, Herta, who had a mand
composed of very neat blooms of nice yuality. Miss Deber composed of very neat blooms of nico
Six bunches, however, were best from Miss Debrewam, wh showed very well in this class, and was followed by Mr. T. L. Turly, gr, to T. Boney, Esq., Southwoo1 House, Highgate, N. and Mr. Clias. Brown.
Mr. T. Tullett, gro to G. Alexanuer, Eeq.. Warley Lodk Brentwood, Essex, had Iat prize for two vases of Chrysan the und booms, twelve large-flowered blooms in each, with good, and only a little Asparagus was is ised in addition to the natural foliage. There were several other competitora in this natural
Amatıup Ciasses,-Mr. H. Love, 1, Melville Terrace, Sandown, Isle of Wight, was lat for twelve bloome of Japanese in not fewer than six varieties, and showed a capital collec
tion, blooms very fine, but lacking colour a little: Sch wabe wagnoticeable. 2nd, Mr, W. Amies, South Ashford

The clans for bix blooms was won by Mr. F. Durrant, 4 New Road, Ware; his collection lacked colour, as the only
flower with any colour was one of W. Tricker. ind, Mr. Ed. Jones, 25, Malvera Road, Hornsey, with bright bui smaller blooms; 3rd, Mr. AMIES.
Single-handed Gardeners. - The best twelpe blooms of Japanese, diatinct, came from Mr. J. Knapp, gr. to F. W. \(\triangle\) MSDEX, Esq.o. 2 \(\lambda_{\text {, Chichester Rood, Croydon ; his best blooms }}\) were W. G. Newett, Eda Prass, and Mrs. E. Jameson. 2 nl , were W. G. New
Mr. J. KMap
Mr. J. Krapp was again successful fur six blooms, including a good one of Annie Clibran; 2nd. Mr. A. W. Southard, gr. to H. B. Kenyon, Esyo, Winning worth, Sutton.

Floral arranjements. - The first class in this section was fur a table of mikcellaneous arrangements, illu-trating the decora tive value of Chrysanthemums. Mr. J. R. Criarm, Nitche Newiagton, won lst for this, and showed an effetive collection of bouquets, wreaths, button holes, spraat, \(\& \ldots\) thl
the whole was rather overdone with terries, and appipare to te designed 10 illustrate the value of terries in decorative exhibits. The best three epergnes of Chryeanthemuma were also shown by Me. J. R. Cuarn, and they exhibited conviderat te
taste. Mr. D. B. Crank. was 2nd ; and Mr. W. Gkres, Jr florist, Harold Wood, entries in this class. The class cluded), was won by

\section*{Miscellankous Exaibats}

We have alreačy described these as very pumeroup. Messrs. JAS. Vertch \& Eons, Royal Kxotic Narsery, Chelsea, had a groap of Chrysanthemums, very noteworthy, the blooms being good, and the group contained plenty of colour. The plante, in our opinion, would have looked better had they been less thickly placed together. Louise, as useal in early shows, figured Largely is the group. Madame Lecro'i, Lady Randolph, President Armand, Commandant Blussett, and M. Auguste ce Lacvivier, were noti. e3ble.

A nother group cf Chrysanthemums was staged by Mr. THos. Fiom Mr, W. J. Gurseries, Desr Tutterham,
From Mr. W. J. Gonfrer, Exmouth Nurserie \({ }^{2}, D_{0}\) vou, came a large display of Chrysanthemum hoome, most of which are Mr. Godirey's own seedlings. Monst. C. Mulin was recommended a Firrt-clans Certificate. Blooms the excellent Carnations, Miss Mary Godirey (white), Regi nald Godifey (pink), and others, were also shown.
Mr. Robt. OWen, Maidenhead, had blozms of rellow Gems, a fimbriated Pompon, flowers very small, with high centre ncurved, erth accellent broad petals (Certifiest) ; apace Bernard, a red flower, with very pale buff revere ( Ce , and col
Mr. W. Wells, who won in the class for twents-four blooms Japanese, exhibited another stand containing about four dozen fine blooms in considerable variety; and Mr. Shofsuif it Claremont Nursery, Woking, had a stand of twelve bloom, including Louise, M. Chaso Molin, Rose Wynne, and Phu'bu9, a good yellow reflesed variety (First-Class Certificate)
From Mr. H. J. Jowrs, Ryecroft Nursery, Hither (ireeu, Lewisham, was a very pretty collection of Chrysanthemum blooms. At the back was \(\overline{\mathrm{g}}\) good lot of Ferns and some conspicuous blooms in stands among these. In front there were seven or eight dozen Chryssnthemum blooms in boxes, Some Meesre. H. CANNELIE \& Soms, I wanley, had a large atand of Dahlia blooms, also of Cannas, and a few Chrytanthemumas. The large permanent fountains, one of which stands at either end of the Aquarium, were on the present occasion used orrangement. Mr. THos.S. WARE, Tottenham, lecorated one of these, and madea very commendable display of all sec. tions of Dahlia. blooms, well furnishing the entire structure. The other one wus capitally done by Messre. CHEAL \& Sow Orawley, who, in addition to Dahlia blooms, displayed a Crawley, who, in additios
Mr. R. F. Sucte, nurseryman, Maidenhead, exhibited various floral arrangements of Chrysanthemums; and Messr? other hardy flowers. Mr. G. Gondson, Belle Vue Nursery, Acton, exhibited a few plants of a new yellow Chrysanthe mum, with moderate-sized, very full flowers, apparently useful for decorative work. Mr, W. HigGs, Fetcham Part Gardens, Leatherhead, showed a number of excellent plante
a blown of Suintpautia ionatha, raised from seed sowa in ramuayy. Mr. E. G. Rern, nurseryman, Kent, had a few Dibtia blooma Cames, \&e
Fruit was exhibited well by several firms. Messrs. JNo, Fruit whs eztibited well He London. S.E., had a first-rate ATNG \& Sons, Forest Fin, London Mer., S. Sponner \& Hounslow, Middleser, and Mr. M. Brawick, sidmonth, Levon, also exhibited wortby collections.
Ocions and Leeks were shown by Mesars. Dobirie \& Co, Rothesay, N.B., and Onions by Mr. H. Deverilu, Banbury.

\section*{MAIDSTONE HARDY FRUIT EXHIBI TION.}

October 8, 9.-This was far the beat exbibition it kind this Society has ever held. The classes were better filled, and the frait generally was of the hiphest order. The entries last year were 98 , as comrared with 255 on the present occasion.

For the best collection, not to exceed twenty-four dishes, grown in the county, open to landowners, tenant-farmers, of marlet-gardeners, there were ten exhibitors. Roger Lirigh; Esq. (gr. Mr. Woodward), tooz the lead, showiog superb Peasgood's, Warhington, Mere de Ménage, Bismarck, Alex ancer Cos's Pomona, and Mother Appleg. four fine dishes of ncer, Con's Pomons, and Mother Apples ; four fine dishes of Peachea, and good Fears. The 2nd prize fell to M. H. Dalli soin, Es, (gr, Mr. LegR) : 3rd and ith, to A. J. TE
Rodmersham, ar, Mrs. Fremus, Teston, respectively.
Rodmersham, ar. 1 Mes. Fremlin, Teston, respectively.
The hest eighteet dishes of Aiples and six dishes of Pears open to all. were from Mr. WOODWARD; 2nd, Mr. S. H. Monimin, Mereworth; closely followed by Mr. Chambers, ionally good Applez.
For nine dishes of Apples and three of Pears, each dish to consist of twelve fruits, and farm gromn, six competed. The 1-t prize went to Mr Tyoves, who staged handsome fruit o The Wieen, Beauty of Kent, Gloria Mundi Bramley's Seedliog The (xiteen, Beauty of Kent, Gloria Mnndi, Bramley's Seedjing Apples. and rery fine Pitmaston Duchess Pears. Mr. Smith, Loddington, closely followed with a remarkably clean lot His best dishes were Cox's Orange Pippin, Ribston Pippin, Queen Curoline, Adam's Pearmain, Tower of Glamis, Bismarck, and Gascoigne Seedling Apples; 3rd, Mrs. Fremlin.

The class for six dishes, four of Apples and two of Peare, twelve fruits to a dish, was won by Mr. A. T. Killick; 2nd Mr. Blest, Broomeroft, Wateringbury; 3rd, Mr. Goodwin.

For one siere of Apples, Cor's Orange Pippin, there were ourteen lots. Mr. T. W. Startup, West Farleigh, was deservedly 1st, with large, handsome, and beautifully-coloure truits: Mr. Thomas and Mr. Goodwiv followed.
For any other dessert kind, Mr. Goodwrs took the lead, thowing grand Kiog of the Pippins; 2nd, Mr. Matwiwarive whowing gramd King
For orse fieve of Cuoking A ppleg eighteen competed, all of hich were exceptionally geod. Mr. Krlick took the lead howing good Peargood Nonsuch ; 2nd, Mr. F. Lockrer, with ery large and well-coloured Blenheim Orange
Mr. SMItit took 1st for four quarter-sievey of Dessert Apples showing very good Matbot's Pearmain, Cux's Orange Pippin Ross* Nompareil and Ribstons; this class was atrong, and eeveral other classes were well filied, the competition being keen throughout.

Miscellaneous
F. S. W. Cornwallis, Esq. (gr., Mr. McKenzie), staged some fifty dishes of Apples and Pears, all of superb quality.
H. I. C. Brassey, Eeri., Preston Hall (gr., Mr. Jarman) contributed some forty dishes of excellent fruit; and Mr. Startup ahewed a similar quantity.
Mr. S. Frost, of the Borough and Ling Nurseries, sent a large and raried collection of Dahlias.

\section*{SoOTLAND.}

LEEK AND ONION SHOW AT ROTHESAY.
While mont persons are reads to admit that the floral production from Rothenay take the lead at northern show, we are not prepared to eay that Rothesay ia able to cope with the groware of the more suany South in the matter of Onions. In the seed stores of Messra. Dobbio \& Co., an exhibition of Leek and Oaions was held, which in its way is as mach an international one as some of the great interuational " hors. Some of the grand Onions shown from disorict wide apart in England and Scotland would grace any show in the country, where ize and quality combined are recognized merits. Leek generally were auch as one is accus. tomed to wee in the North, mostly of fine form, well blanched, firm, and of large girth. It in to be hoped thim interenting exhibition, promoted by Mesers Dobbie \& Co. will be the forerunner of Leek and Oniou thows of greater magnitude. If vegetable roote were added to auch a show, they would increase the interent very materially-we think the promoter occane in iow, and \(t\) liberality on this occanon hat done wonders by bringing together
without any fuw, nearly eighty exhibitors for four apecimen Onion, and over aisty for Leek ; and, remarking the excellence of the exhibits all round, they increased the number of prizes, which were as follows:-Leek-1st, Mr. L. Collins, 108, Weat Wylam, near Prudhoe; 2ad, Mr. D. Logan, Castlelaw, near Coldstream, Keleo ; 3rd, Mr. J. Edwards, stationmaster, Stanley, Perth; 4th, Mr. Jame Hall, Kelso; 5th, Mr. William Laverock, 113, Grinlaws, Leslie. Other fine acknowledgments were made. Onions-1st, J. Bowerman, The Gardens, Hackwood Pars, Baningatoke; 2ad, T. Wilkina, Inwood Garden!, Henstridge, Blandford; 3rd, Noah Knellar, Malahanger Gardens, Basingstoke; 4tb, Adam Danlope, Flowerbank Cottage, Galston; 5th, R. Fishwick, Singleton, Poulton-le-Fglde; 6ih, G. H. Cop, Gardens, Honest Park, Sherbourne; 7th, R. Paton, 40, Orchard Street, Galaton; 8sh, J. Hall, Singleton, Poulton-le-Fylde; 9th, H. Taylor, Gardener, Gredington, Whitechurch; 10 sh, W. Rankine, Loch Ryan, Stranraer. While there was nothing inferior in wny of the exhibits, most of them were firstrate, and admitted on all handa to be the finest bulbs ever seen in Scotland at any exhibition. M. Temple.

\section*{Notes from Coltoquhey, Perthshire.}

For some years past I have been desirous to see the gardens at Caltoqubey, near Crieff, the sest of J. M. Grabam, E q., where that popalar proprietor's gardener, Mr. Fender, has raised the excellent vegetable he has exhibited for some years at the great bows held at Edinburgh and Glaggow. The atrong points in the Caltoquatey collection generally are cleanneas and firt-rate quality, rather than grossneas and large mize.

At thil lovely seat there are other attraction than vegetables, such as the fine specimens of Conifera which adorn the extensive grounds. Though in common with Ochtertyre, and other places in the locality, some losaes were suatained by the severe gales in November of 1893, there are atill aufficient fine specimens to render Cultoquher attractive to lovers of Coniferæ. Among Oaks, Ashes, and other large trees of the deciduous class, are to be found the following, which have recently been measured, in order to find the actual progrea they are making in height and girth of tranks 5 feet from the ground. The trees are in good health, and handsome in form. Taga Mertensiana, 68 feet high, and 4 feet 9 inches in girth; Abies grandis, 68 feet high, and 5 feet 9 inches in girth; A. Nordmanniana, is feet 6 icche high, and 7 feet \(f\) inche in girth; Taxodium sempervirens, 49 feet 6 inchen high, and 7 feet 3 inches in girth; Thaiopsis borealis, 34 feet high, in buth form; Sequoia gigantea, 54 feet 6 inches high, and 10 feet in girth; Araucaria imbricate, 50 feet high, and 5 feet 8 inches in girth (this plant meanures 16 feet at groand). Many others are doing remarkably well, iacluding Picea Menaienii, P. orientalis, Taga Pattonii, Abiea cephalonica, A. L')wis, and A. Pinapo.

In the vegetable garden we found abundance of excellent produce. Good soil, deep tilth, and the judicions application of manure by Mr. Fender, renalt in excellent crops.

A carnory inspection of the fruit crop thowed the careful attention the trees receive. Pears, moatly grown on wall, are represented by William.' Bon Cbsésien, Marie Lonisp, Comte de Lamy, Louise Bonne, Swan Egg. Moorfowl Egg (still a great favourite in the Nortb), and some other of the hardier sorta, it being useless to attempt to cultivate the fine Fsench Pears, which require more aid from san than they would get in mid. Perthehire. Hardy and useful kinds of Apples, Plams and other frait are caltivated. Hale's Early Peach wa in capital condition on the walls.
I did not leave before seeing the Marechal Niel Rose which has prodaced for yeara past fine prizetaking flowers. It is grafted on the White Banksian, is cat hard back, and trained over the roof of a greenhouve. M. Temple, Carron, N.B.

Streptocarpus.- We have received through the courtea) of Menirr. Jan. Veitch \& Sons, Chelsea, a few late flowers, in various colour, of their new hybrid Streptocappuser, which were noticed more

Nursery Notes,

\section*{ROYAL EXOTIC NURSERIES CHELTENHAM.}

Thesa nurueries have been carried on by Memb, Heath \& Son for many years with conoiderable auccess and profit, and the various departmenter of the business are anusually extensive and comprehensive. Throngbout the midland, western, and northern counties the firm has long been famous and it is gratifying to know that their fame in mell sustained at the present time. The nursery atok generally is excellent; stove and greenhouse plow are varied and well grown, as also Orchida, and the breadths of Roses, Dahlias, froit trees and ahriun in every instance bespeak the master hand. A good assortment of the more valued herbaceous peres. nials is grown in considerable numbers, and in proportion to their various merits. The cut lioner trade of the nurseries in very large; the number of wreathe, crosses, and other floral designs despatchad in the busy season is very considerable. To meet such a large demand, large number of nuitable plante for flowering in the winter are growa, and among these Tea Roses in pots form a considerable proportion; and for these alone several houses aro utilised, and two or three methods adopted in their cultivation, so as to meet the requirements of certain varietier grown. Oa the other hand, to retard or proo long the season of flowering to the very atmoth, besides these pot Roses, others are planted in border made in the houses-some of the Rose-honm having portable roofa, which admit of a thorough and complete ripening of the wood by remoring the lights. Large numbers of tree Carnations are allo cultivated, particularly of those chades of pink reprosented by Miss Joliffe. One large houre contained a batch of an unoamed pink variety, evidently of perpetaal character, which at the time of my vitit was pushing forward its spikes in sevaral atages that promised a long succession of bloom daring the atamu and early winter. Jadging by the lown that were expanded, it is of a somewhat deeper thade of pink than Miss Joliffe, and it is a fuller flowef.

Bourardias are caltivated on an extensive uche in all the leadiag varietien, planting out as well a pot-calture being adopted-those planted out being a very promising brtch, notwithstanding the great heat of the patt summer, the stardy vigorous bathes showing that they had been well tended. The planting-out method for these plants was adopted some jears ago, and it has been very succesfah Near one of the beds of Bouvardias was a low apano roofed pit, flled with Boovardia planta in potr, wine of which were on the point of opening their fiower These were a capital lot of plants, numbering antrin handreds, vigoroun, fresh-looking, and fall of forte. bud.

Poinsettias form another extenoive item, and were noteworthy for the dwarf turdy character of the plants, which is in a measure accounted for by the fact that they were grown fully exposed in opea frames. In the culture of thene decorative plank Mesars. Heath avoid tall, leggy, leafless planta, pre ferrigg to produce quantities of plants of an uniforme aize, which in the long run are the more nefeler From the first the plants are accustomed to a coolm treatment than is usually thought good for them and the large batch of plants bear proof of the cot rectnens of the treatment afforded. The plaw carry their foliage down to the pote, not drann and weak an one often see Poinsettial, of rendered too delicate for ordinary decorative parposel.

Among the atove-planta, many of the leading Codisenms (Crotons), in well-coloured exampletr wers noticed, many of them very brilliant bigh effective. These plants are the products of the temperatures, abundant mointure, nearnen glans, where they receive the fallest posible suasen for the greater part of the day. In another Dafin containing the Ixoras, I noted a fine pair these phas between 5 feet and 6 feet throngh. These play carried some forty or more fine growths, all grand trusses of bloom.

Urchids are also grown largely here, particularly thone beat saited to cat flowers, together with many good and rare kinds too nameroas for this brief note. Of thone that were grown abandantly and deserved apecial note wa. a very large batch of Cypripediam insigne, which include many forms of the ine old Orchid-there were quantities of large apecimen in excellent condition. Coologyne cristata was also largely represented. Another large house was almont wholly devoted to Dendrobium Phalænopsis Schroderianam. Of this alone there were a large number of plants in many nizes, and remarkable variety. The collection was jast coming into flower at the time of my visit, and already many pleasing flowers were \&xpanded. The great value of this Orchid is now well known, and in a large assortment of plants sach as may be here seen there in almont endless variety, as well as a long-continued season of bloom.
In the bardy plant department many of the more howy and useful epscies were to be seen, auch as shrabby Phloxe in much variety, Michaelmas Duiaits, Rudbeckias, hosts of Gaillardiae, perennial Santlowers, notably H. multiflorns and varipties; Tritomar, Pyrethruma, Campanulan in variety, CEaothers macrocarpa, with it large yellow blosoms fully expanded. And apart from these, Carnations, Pinks, Asterp, and a host of other similarly useful material. There were also Dablias and Gladiolus planted cut in bed galore; while in plantation of the yellow Marguerite, Chryanthemum frutencent var, Etoile d'Or, was daily expanding many hundrede of its a

THEPA8TWEEK
Tar following summary record of the weather throughout the British Islands for the week ending October \(\delta\), is umished from the Meteorological Office s-
\({ }^{6}\) The weather contioved very fine and summerlite during the two first days of the period. On Ostober 1, however, it became very unsettled and rainy in the extreme south-weat
and west, and theoe conditions gradually exteaded to all parta of the Kingdom. Heavy falls of rein were experienced over the country generally, especially in 'England, S.W. and the Channel Islands.' Thunder and lightning cccurred in many localities about the middle of the period.

The temperature at first continued extremely high for the time of year, but subserquently fell rapidly and became rather low, frost occurring on the ground early on the 3s.1. The avergge values for the week, however, were again ab ve the mean in all districts excepting 'Scotland, E.,' the exces raoging from \(1^{\circ}\) in 'Scotland, W. and Ireland, 8. . \(^{\prime}\) to \(4^{\circ}\) in "Eugland, S. and S.W.,' and \(5^{\circ}\) in the 'Chanoel Islanis." The highest of the maxima (registered on September 29 or 30 ) ranged from \(8: 3^{\circ}\) in "Engiand, N.E. \({ }^{\circ} 8 i^{\circ}\) in ' England, N.W. and from \(78^{\circ}\) or \(79^{\circ}\) in most other districts, to \(74^{\circ}\) in 'Scotland F. and W.' The lowest of the minima were recorded towarde the end of the weok, when the thermometer fell to \(31^{\circ}\) in Scotland, N. and E. and in Eogland, \&.W. to \(33^{\circ}\) over central and eastern Rpgland, and to between \(85^{\circ}\) and \(37^{\circ}\) in all obher diatricts, excepling the 'Channel ralands.' where the lowest reading was \(45^{\circ}\)

The rainial was rather lens than the mean in ' Englasd, N.E., and just tyualled it in ' England, E; but was in oxcess in all other districts, especiaily in the west and north, the fall in 'Evgland, S.W. and the Chanuel Islands' being nearly three times the mean. The greatest fall at any individua station was 5.35 ing, at Arlington, of which 2.71 ins. fell on October
'The bright sunshine shows a great decrease over the Kingdom qenerally, but a decided increase in "Scotland, N . It was, however, again in excess of the mean, the percentage of the possible duration ranging from 5y in "Eogland, S.W., 48 in 'Epgland, K. and 8.. 47 in 'Ireland, S., to 33 in Scotland, W.,' and 30 in 'England, N.W.'

\section*{SEEDS.}

Lormox: October y.-Messis. John Shaw Sons, Seed Merchants, of Great Maze Pond, Borougb, London. 8.E. write that French Red Clover-seeds come cheaper. There ia nothing yet doing in Alsyke, White, and Trefoil. Rye-grasses are also reglected. Winter Tares show some improvement both in value and demand. There is no change in Rye Canary-seed is decidedly stronger. Hemp-sed uanltered Blue Peas meet an increaced demand. Haricot Beans are hald for higher rates. Linseed and Buckwheatalso tend upwards.

\section*{ENQUIRY.}

\footnotetext{

A Thirty two Years' Subscriber akk if any of the numerous readers of the Gardeners' Chrowicle, will kindly inform him where be can procure, by parcbase or otherwise, the following old garden plants:-Cuttings or plant of bedding Calceolaria Sparkler, Fuchia Dachess of Lancaster (iight), and Tropmolam elegane or Crystal Palace Nasturtiam, the laut of which wan uned with such telling effect on the terraces at the Palace mome thirtyonix yearn ago
}

\section*{Notices to Correspondents.}
- Owing to the large increass in our circulation, we are under the neccessity of goinp to press some hours earlier. Our contributors whit kindly aid us by sending thetr communclat rench as earlv in the week as possit
Amaryleis: \(G . H_{0}\) W. If you curn to p. 342 in our issue for September 21, 1895, you will find an answer to all of your questions regarding the treatment of Amaryllis.
Ampleopsis Veitchil: L. C, Rugby. The lobed leave and the trifoliolate leaver are simply the retult of unusual vigour. A. Veitchii uader glase produce very large-lobed and compound leaves. The plant, as grown out of doors, has not a chance of developing to the full extent.
Books-Floral Decoration: G. W. A. and I. M. C. We believe Mr. Upcott Gill, Bazaar Office, 170 Strand, W.C., publishes a modern manual on thia aubjoct. A swall one by C.C. Saward was published by the same Office late in the 60 's, but this is too antiquated to be of much uae. A larger work by Acnie Haanard, entitled Floral Decoration for the Dwelling Houre, was published by Macmillan \& Co in 1875, and may be met with at the secondhasd borknhop.-Arboretum. Kemp's How to Lay Out a Garden, published by Messras. Bradbary. Agned Co., Limited, Boaverie Street, E.C.; and H nry E. Milner' The Art and Practice of Land scape Gardening, published by Mess, Simpkin Marbill. Hamition, Kent \& Co., Limited, Stationers' Hali Court, London.-M. Gillett. Villa Gardening, by Hobday, pablished by Mensra. Macmilian \& Ca, Bedford Street, Covent Gar
der, W.C, contains very good directions for cal tivating vegetables in private places.-H.W. My Gardener, by H. W. Ward, pablished by Eyre \&o Spcttiswoode, East Harding Street, London, E.C. will afford just the sort of information on Kitchen Gardening that yca require.
Clubbing in Chrysanthemum Roots: K. J. G. The c:ubbing of Coryanthemum roots has in some instances been proved to be caused by the use of unevitable manare, and the example examined in probably to caused. Eolwoimg and fangi are abren?. G. M.
Dendrobick; Wahimanum and Nobile: W. S. The plants are enffernge from excess of water at the root, and they have probably lost many of their roots entirely, or these have rotted from the point a short diatance. An examination of the roota is very neceseary. If these ere foand to be decayed, wash what remains after decayed portions are cut away, and insert them trmporarily in pitp, chieflg filled with clean crocks, and jut a maall smount of ephagnum-moss, keeping them in a moderattly warm moist house, and lightly syringing them once or twice a week. In the apring proper petting or baketing may be done.
Fasciation in Antirrbinom The Sarrey Seed Cu. send a photograph of a plant in this condition which is very common, as a result probably of overgrowth.
Four Glass Houees, each of 150 feet long Cyclamen. It is of no use attempting to caltivate French Bean by cool treatment. Nothing leas than a day temperature of \(70^{\circ}\) to \(75^{\circ}\), and night ditto of \(60^{\circ}\) will anffice. You might grow Tomator, but it will be necessary to obtain by purchase robust plante, and plant at once ; also Cucumbers, chooning a mediam-sizad early prolific variety. Those should now be in the beds if for very early fruiting, though for auccesaion later plantiage would do. In these forcing houses you might grow Rhubarb, Rowea, Lily of the Valley, winterblooming Bagonias, early Narcisas, and other Datch Balbe; Gardeniar, if clean plants can be obtained; Rhododendron hybridum, Eacharis, Myraiphyllam, Lsgodium, Maidenhair Fern, Mustard and Cress, \&c.
Grapes and Applbs: C. W. H. The Grapen are shanked, the causen of which malady are varioun; such as losn of roots through a noddened, badly drained, or pasty soil; roota growing low down in a deep border way from the active agency of of the folisge byping; and andden lows of much We would advise improper thinning of the shoots. roots. The Apple have early examination of the roots. The Apples have probably been injured in
the young atate by hail. Graprs sot Cotoremo

fail to finioh. Banch and berries are of good size, They require to be atarted fairly early in the season, and must be given plenty of heat. In this respect they require just the same treatment as Muscat of Alexandia.
Insects: \(G\). \(A\). The name of the beetle is Oiibrua æыеиs. R.McL.
Mushrooms: A Subscriber. We do not suppose that Mashroom would not grow on manare from horsen fed largely on Thorley's Food, bat the crops would not equal what would bs obtained from corn-fed animals, Perhaps some of our reader will kindly state their experience.
** Plants, Fruirs, exc, to Be Namkd. The applications to name flowers, and especialy fruit, are so numerous
at this season as severely to taic our resources. They entail an expenditure of time, labour, and money, of which our readers have no idea. We are alwxy willing to oblige our
correspondents as far as wec ma , but the editing of the Gurdsmers correspondents as far as we cha, but the editing of the G ardeners Chronicli is our busimess, to which everything else must give way Correspondents are respsctfully requested to observe at a time. that not more than six specimens cacej be act on the part of the If more are sent, it wou d be a qraceful act to the Gardeners Orphan Fund. Correspondents sending plants or fruits to be Orphan Fund. Corressonens demanding time and research for nomed, or ortion, must not expect to obtain an answer to their enquiries in the current week. Specimens should bo goos ourie. carefully packed and numbered.
Names of Fruits: W. T. H. Your aecond attempt is a greater failure than your first. The card-board box and Apple arrived quite flat, and the wonder is that the letter was not lost. We shall not be urprised if the Apple proves to be merely a local variety.-J. T. O. 1, Gloria Mandi; L, L Ird Derby; 3, not recognised, much bruised; 4, Duyenné du Comice; 5, Chanmontelle; 6, Napo-léjn.-Alpha. 2, 5, Beurré de Capiaamont; Beurré Clairgeau; 1, Beurré d'Amanlis; 4, Triomphe de Jodoigne; 7, Beurié Diel (thanks for aubscription to the Gardeners' Orphan Fund, which has been sent to the Secretary).-E. G. Allen Unknown to us, most probably a purely local variety.-W. H.D. 1, Hollandbury; 2, Emperor Alexander; 3. Hawtnornden; 4. O.d Nonpareil; 5. Blenheim Órange; 6, Karry Pippin.-P. J. 4, Fearn'u Pippin; 5, King of the Yippins. Oubers unknown, worthlest. -T. S. 1, Stirling Catle 2. Eymuad Japp; 3 Callini ; 4, Datch Mignonne 5, Waltham Abbey Sueding.-Sherrington. Pear Chaumontelle. - W. For. Pear Fundarte d'A'a tomne.-J. D, Bracknell. 1, Lonuise Bunne; 4 Fondante d'Aatomne; 5, Jeraey Gratioli, 7 Marie Louise (gour box was too shallew
and the fruits were injared) \(-K\). J. \(G\). Bedfordahire Foundling; 2, Qreen Caroline 3. Kirry Pippin; 4 Beaaty of Kent; 5 A S. Harvy, Highgate. Yuar Pear is a stowiong variety, Uprdale's Nis Germains, and never becomes melting. -W. H. Garside. Apple, Emperar Alexander; Pear No. 2, is Marie Louise; : 3 L Luipe Binne of Jeramy.-J.S. 1, Urbaniste; 2, Cul Vaughan; 3. Marie Luaise; 4, Gravenstein; Pear, Alchorp Crasnane. C. Harlock. Your Apple is Fearn's Pippin.-S. N. 1, Beurré Diel; 2
 Maréchal de la Cour ; 5, Betty Gseson; 6, Gioria Mandi; Peachen shoald not be packed with Apples or Pears, they were past recogaition.-W. \(A\), Apple, Allen's Everlasting; 2, Karry Pippin; 3 l'ear, Williams' Bon Chrésien; 4. Durondesu; and 6, Bearré de Capiaumont.-Joe. 1, Holland. bury; 2 and 12, not known; 3, Fearn's Pıppin; 10, Emperor Alexander; 8, Lord Saffield; 9, Pineapple Rumet; 11, Fearn' Pippin.-G. F. F. 1, not recogaised; 2, Dake of Devonshire; 3, Hambledon Diax Ans; 4, Smart's Prince Arthur. [We wish all our correspondent would pack the frait they send as carefally an you have done, and enclose particulars of each variety, together with shoots and foliage.]-G. H. Your Plams were packed badly, and in too small a box. It you send again, you should enclose a shoot of the variety.
Names of Plants: Correspondents not answered in this issue are requested to consult the next number.W. Maxwell. Send another specimen; box quits mashed in transit.-S. W. Apparently the Casmpignon, bat it was shrivelled. The other is the spawn of some fungus, which we cannot name in ite prenent atate. -P. \(H\). Fraxinus excelsa mono phylla.-A. S. Cratægu: coccinea, \(-N\), C. 1 Solidago virga aurea; 2, not recognined; 3, Pulygonum aviculare; 4, Epilobium parvilorum. R. N. 1, Farfugium grande; 2, Francoa ramona; 3. Dieffenbachianobilis; 4, Acalypha Ma?afeeans
, Anthericum lineare variegatam; 6, Fittonia Pearcei.-E.J. Aberdeen. 1, Pellionia Daveanama
 nica of gardena; 4 Selapinelia circinain; 5 , Sela-
ginella denticulata; 6, Selaginella K ginella denticulata; 6, Selaginella Kraumians anrea; 7 , Anthericum lineare variegatum; \(y\) The above names are correct, we believe; bat the specimens nent are very imperfect.-E. \(H\), The common Tree Onion. Plant in March, \(-\sqrt{1}\). Salvia elegans.
Payina Crops undre Glass: A. B. See our aamm to Cyclamen. In regard to your other quention, everything would depend apon your having good marketable prodace which you could put on th market at little cost in carriage, and in fivt condition. Some men would make a gool hiviag out of a glass-house, 100 by 9 feet, whilat athm would starve. We cannot alay what the retman would be from 900 square feet of Stephanotia millo managed, and coming in early, but they moald represent a large sum of money.
Persistent Attacks of Mildew on Roses: P. R. There must be nomething amise with the woil on which the house stand ; perhaps it is not drained, and the soil being retentive holds much water, and in that way favours the spread of milden. Mildew often attacks Roses in hoases when the air is cool and moist, and again when air is admitted as or near the level of the ground. It in always prudent to ventilate as much as ponible at the top of the house. Oa warm dry soils and aituations it is of little consequence how air is admitted. The common Burberry is a dangerom shrub to have near Roses. We wonld adrive the constant use of alphar as a powder wheremith to dust over affected plants, and as a matery nolntion to keep in broad hallow ancers placed aboat the houne.
Rating of Trade Glasshouses: \(D . K\). Tie amell ment on hoases actually employed in the culim: tion of plants, fruits, \&c., for sale parposet, it one-fourth of the unual amount levied. Sie cman of Parser \(v\). Wurthing Local Board, in cuc iumt for March 26, p. 422 , vol. i., 1887, and May 21, p. 650, same vol.

Roses in an Exposed Garden: H. W. Unien you can afford the plants the bent of shelter from the prevailing sea-winds, the Roses will not pir atiafaction. Taick, high hedges, and namor plantations of Maple, with Holly, Rhododendron, Lzurel, I)aphne Mfzereon, \&c., kept as low bublen are better than walls. Given shelter, at a disanam of 10 to 15 yard from the R se-bedr, any section of the Ruse should do well.
axifraga granolata: W.C. Put the piants fraly in a mixtare of loam, broken sandacone, and sid small quantity of old mortar, uaing amall inatio pots, asy, \(60^{\prime}\), and winter them in a coll pili, ore plasted out-ofodeors in March
be planted out-of-door in March. ine Root: A. Roberts. Not Phyllozera deratus but an excreacence due to abome from front. The Vine muat be very old.
Vines and the ose of Richards' XL All Vapobigrs: J. W. M. The nee of this insecticide is norr injarious to plante of every kind, if ared accon ing to the direction given, and we are been aware of any case in which Grapen bay homerl,
injured by it. As a matter of pradence, injured by it. As a matter of pradence, apprascings it should not be used on Grapes appro of the ripenea, When the Graper are
Communcations Received. - J. W. Wilkinson. - B. G. Bi letter card forwarded on day of its recaipt. -J. Mo Bo - Mome.

CLIMATE, AND THE ORIGIN OF ROOT-CROPS.

\(\mathrm{I}^{\mathrm{N}}\)N spite of the labours of the numerous botanists and agricultarists of the present day, it is not by any means clear that we know much more about the effeots of olimate than does an ordinary working farmer.
In estimating the special effeot of olimate on one partioular root-organ, there are two methods open to us ; we may adopt statistics, or we mas try the effect of direct experiment.

Taking statistios first, it is best to compare the average yield per acre of our oommon root-crops-Turnips, Mangels, and also Potatos-for the years 1885-189t, as given in the Agricultural Returns for Great Britain, with the climate in those years.

I therefore obtained (through the kindness of Mr. E. Clarke) from the agrioultural returns of the Board of Trade, the following table of the average yield per aore of Tarnips, Mangels, and Potatos, throaghout Great Britain in the years 1885-1804. I have to thank Mr. Marriott of the Meteorological Society for assisting me to find the returns given in the right-half of the table, which represent the total rainy days, inches of rainfall and hours of sunshine in the months of May, June, July, and August during the same years:-
\begin{tabular}{|c|c|c|c|c|c|c|}
\hline Tear. &  &  &  &  &  &  \\
\hline 1885 ... & 10.41 & 16.24 & 474 & 51 & 760 & 721 \\
\hline 1886 ... & 1475 & \(20 \cdot 13\) & 431 & 60 & 1046 & 657 \\
\hline 1887 ... & 988 & 14.61 & \(5 \cdot 36\) & 43 & 585 & 809 \\
\hline 1888 & 12-51 & 1678 & 400 & \({ }^{2} 5\) & 12.30 & 624 \\
\hline 1889 ... & 14.48 & 18.21 & 4.71 & 60 & 1115 & 870 \\
\hline 1890 ... & 14.27 & 17.76 & \(3 \cdot 53\) & ¢9 & 11.28 & 637 \\
\hline 1891 ..0 & 1340 & 1860 & 4.74 & 65 & 11\%09 & 638 \\
\hline 1892 ... & 1404 & 17.99 & 445 & 60 & 11.27 & 684 \\
\hline 1893 ... & 1368 & 13.26 & 523 & 54 & 9015 & 764 \\
\hline 1894... & 13.83 & 1802 & 388 & 74 & 12-95 & 018 \\
\hline
\end{tabular}

Now this table in at first sight only remarkable for one thing, and that is that it is apparently atterly impossible for haman ingenaity to oxtract anything of the slightest sorvice to mankind from its perusal. In a case of this lriad it is always advinable to draw curves representing figures, as then the most striking feature are perceptible at a glanoe, but it is necessary to be very oareful how these ourves are drawn, for it is a popular fallacy that anything can be proved by statistios.

The manner I have adopted is to take only the deriations from a normal or average. Thus the
dotted ourve in fig. 78 - . . represents the varistion from a normal number of rainy days. The average namber of rainy days in the four months May to August is 603 . The actual amount recorded in any year is then oompared with this average number, and the difference forms the distanoe above or below the line \(a-b\). The plain line represents the crop returns, or rather the average yield per aore of Turnips and Mangels combined throughont Great Britain in a similar manner. 'The normal orops of each root, taken from the average of the ten years, that is for Turnips 13.09 tons per acre and for Mangels 17.06 , were oompared with the amount in each year, and the result is given as the vertical distances. The thin line represents the Potsto returns, taken in the same way for the ten years.
All three curves are made to startfrom the same point by ohooring a proper measurement-unit.
This gives a mot unexpected realt; the Tarnip and Mangel crops are seen to follow with extraordinary accuracy the amount of rainy daje in those four monthe, but there is one exception. In'the year 1889 there is a lese than normal amount of rainy days but a very good crop. Probably thin is due to some particular manner in which the days were dietributed so as to give a maximum of moistare with an few rainy days as posible.
This proves what Sir John Lawes pointed out in 1855, Journal of the Agricultural Society, vol, iiii, "the most favourable conditions of growth for our cultivated bulb-forming Turnips are a low degree of temperature, a large number of rainy days, and a large actual amount of rain."
Bat when we turn to the Potato crop, there is exactly the opposite reanlt. Wherever there is a great rive or fall in the number of rainy dayn it in followed by the reverse in the Potato curve; this last resalt is probably due to the action of moistare in favouring Potato disease, for in the South of Earope, and dry conatries generally, it is not found that Potatos do particularly well, but as a rule tarn out rather a failure. Oa the whole, the conclusion seems pretty safe that it is the number of raing days which exercise the greatest influence on the root-crop. The following table shown their diatribution:-
\begin{tabular}{lc|c|c|c|c|c|c|c|c|c|c}
\hline & & 1885 & 1888 & 1887 & 1888 & 1889 & 1890 & 1891 & 1802 & 1893 & 1894 \\
\hline May & \(\ldots\) & 21 & 18 & 13 & 10 & 14 & 15 & 15 & 14 & 10 & 16 \\
June & \(\ldots\) & 14 & 15 & 6 & 19 & 10 & 19 & 14 & 19 & 12 & 20 \\
July & \(\ldots\) & 9 & 14 & 13 & 20 & 16 & 18 & 15 & 11 & 16 & 18 \\
August & \(\ldots\) & 10 & 15 & 11 & 16 & 20 & 17 & 21 & 16 & 16 & 20 \\
\hline
\end{tabular}

Leaving the tatistical method, it is beat to examine the result of actaal experiment to see whether this reanlt in actually borne out by independent observers, who examined the behaviour of plants artificially grown under various circumetances

A gocd many are recorded in Profeasor Henalow's Origins of Plant Structures. Even in the time of Piny the Greeks neem to have discovered that by growing Radiahe: in a cloggy oil, a more fleahy Tumip-like root might bo obtained. This experi ment has been repeated with the name reanlt by many others: ©.g., Carrier at Parin in 1869 fonnd that from the wild Radish (Raphanui raphanistram) a Turnip-like fleshy root could be obtained by growing it in clay, while only a long and narrow root arpeared in a mandy noil. This method was also adopted by Backman at Cirenceater, and by Bretfeld in Vienna, with quite similar results. It has alao been proved that if a fleahy, Tumip-shaped Radish is grown in light eandy soil, then it will in course of cultivation become again long and narrow. It is obvious that all theme experiments can be at once brought into line with the atatietical experience (clogey ing out the aimple fact that a clay ooil (clogey is su even better terme) will naturally hold mame way an a by keeping itaelf moist, act in the all the people who worked of rainy days. Hence agree in pheople who worked quite independently

But a direct proof bas been foamd
quite anpractical experiment which wat conducted by Birner, who cultivated a number of Potatos in pots, which contained different amounts of water. He foand that the namber of taberm and the weight of each in any pot depended exactly on the amoant of water in the particular case. The more water, the more and heavier were the tuberf.

In a case of this kind it is slways interesting to see how and why this underground atore of farinaceous food hat been formed. Now, every out-of-door botanist expect! to find bulbs, tubers, and so on, in a dry or dewert climate, not in a wet one. Thas, in Africa they are far the most abundant (that is to asy, in proportion to the reat of the flora) in the Sahara, the Kalahari Desert, and Namaqualend. In such place one finde all sort and kinds of planta taking to this habit-Pelargoniums, for inatance, which asually never attempt anything of the kind, produce large bulbe.

The reason why this arrangement has been adopted is obvious to anyone who has passed through the Karroo in South Africa before and after a shower of rain. Before, everything except a few fleshy-leaved water-atoring plants is dry and apparently dead; after it, the ground is covered by the rosettes of Liliey, Amaryllis, and handred of other balbous plants, which only require moisture to develop with magical rapidity. At the water gete dried up, the e leaves, baving manafactured a certain amount of starch or angar, die away, and perhaps in

\[

\]

Fig. 78:-RAIN 4 nd root-crop dilgram.
even or eight years the: will be enough food material accumulated to enable the plant to aend out a stalk covered with magnificent fowers.

It neems to be the case that whenever in Africa, Asia, or America one find theme dry conditions, then there is arre to be a large number of bulbous or taberous plant.. In our own country, these form are mont common amongat the plante of early apring. Their atore enables them to flower and produce leaves immediately, so thut they have the soil all to themelves, and are not exposed to the congented etate of things which prevails in summer-that is, they live in moist and fairly cold conditions. To point out in what manner (or how) theme structares have been developed, is very much more hazardout.
Still, we may note first, that as a matter of fact, most of our common root or tuber plante have been formed in dry or hot countries. Do Candolle gives the birth-place of a certain number. Thus the deserts of the Cancasus and Palestine probably prodaced the primordial Radish and Onion. Eatern Earope in remponaible for the Horseradiah, and possibly alwo the Turnip. The Salwafy neems a native of Greece and Algeria, and Scorzonera neeme to be Spanish, while the Potato, so far an one can judge, is a Chilian epecien. One effect of a dry or desert climate has been proved beyond any room for controversy, and that is the tendency for the branchen to become short, or in other words, for the internodes to be shortened or mappresed. This is probably because all the tisurea in a desert-plant are exceedingly hard and rigid (i.e., plenty of welerenchyma and cuticularination), and hence it in without any wildneas of speculation that one can may that the drought, by preventing the rising of the atem, tend to increave the diameter of the inderground portion. Being nuable to increase in length, the utep expande in thicknest This
explanation is more or leme clearly given in Professor Henslow's book, and it onable us to anderatand the origin of bulbs in a sort of manver.
In our own country we find comparatively for bulbou plants because the climate is too moidt for them to be formed naturally; and hence, if we wat thern, we have to get them from elsewhere. At ay rate, the ancient Egyptian who began growing rooth in hif mud-patch at home, in order to are himulf the trouble of going to the devert in time of faming to dig them up, must have been pleased when in found that they were capable of drinking a very gruc deal more than they ever had the chance of doing their home in the ande, and now this habit ham improved and rendered to a certain extent herditur, Still, even now, theme plant would in Eogure once take to forming stems if they had the who tunity. G. F. Soott Elliot.

\section*{KEW NOTES.}

Habenaria Susannks. - When grown in u intermediate temperatare the flowers of this bemtiful Orchid are quite as fine as thone proded in a hot-house, but the atem is only about hall as long. The leaves are leas likely to fill : prey to spot in the cooler house than when kep hot and moist. There has been a good diaply this year of flowern upon plants of this Habenaria grown thus at Kow, some of the planta having had six flowers open at once, each 2 inchen acron, pure white, with a large comb-like lip, and we look upon it as a useful addition to anmmer-fowering terrestrial Orchide. According to Major-General Berkeley, in the Orchid Review, it has long been a favouris garden plant in the East, but always in hot moint aituations. At Kew it is planted in light lonmy soil, in pots, and grown in an intermediate temperso ture, the tubers being repotted in February at the tame time as H. carnona and H. puailla (militaris) are atarted.

\section*{Baurinia Galpini.}

This plant was described by Mr. Brown in the Gardeners' Chrovicle, 1891, xio, p. 728, and a figare of it was published in Hooker' Icones Plantarmm. Seede of it were sent to Kew from the Traasual by Mr. Galpin, after whom it was named, and who deacribed it as an elegant shrub, with small leaver, and racemes of large bright crimson flowern A plant of it is now flowering for the first time in the Sacculent-house at Kew, where it is planted in the border amongat the Agaves. Here it receiver plenty of air and annshine in summer, and in winter it getm aufficiently dry at the root to came all the leaves to fall. The flowers aro proo daced on the ends of the branchleta, new the top of the principal branches; they are in hort racemes, each consisting of five flowers, the atalke of which are 1 inch long; the calyx-loben are narrow, reflezed, and the equal petale I inch long, apoon-thaped, forming a cup, which in aize and colour muggents the flower of a common Natartiam, The leaves are bilobed, and 2 inchen acrons. Clon to the Baubinis, which is about 6 feet high, there are fine examples of Leucadendron argentenm, Poine ciana regia, and Diospyro kaki, the latter baaring frait, and they all receive the asme treatment as the Banhinia.

\section*{Amigtolocint magars.}

In his note on this plant (see p. 369), Mr. Hemiley appeara to have overlooked a note which was publithed in the Gardeners' Chronicle the week ittes the description of the epecies by Dr. Matert appeared (eee Gardewers' Chronicle, Soptember, 1885, pp. 301, 338). This note contains an extract from a letter written to the Director of Kew by Baroi Capanema, of Rio, who sent plante of A. eleganes to Kow in July, 1885. One of thewe plants was figarod in the Botanical Magazine, no that the Baron and Kow may claim as mach credit for the introdaction of the plant into Earopean gardens as M. Glasiow and Mr. Ball. The Baron diatinctly atates that bo raised the plant from seeds which he received and years previoualy from Paraguay, and that if
became a common gardon plant in Rio. Io produce
seeds freely under cultivation here, and is juat the kind of plant that would aoon apread wherever it got a foothold. Of courne, it may have been introduced into Paraguay, but so far an in known, all the plants in cultivation of A. elegans are, according to Baron Capanems, from that soarce. W. W., Kew.

\section*{Lespedeza Sirboldi, Mieublo}

Thin in decidedly one of the mont ornamental of antumb-flowering Leguminiferout plants, and this gear it is eapecially fine, the anny weather during the latter half of September having aided the development of an exceptional abundance of flower. A fine antumn is, indeed, needed to show this abrub to beat advantage. A large group of it in the collection of abrabby Legaminome at Kew hat been fully in flower for the last four weeks. It is a plant of graceful babit, sending ap each year from the stool strong, arching shoots 5 to 6 feet long, which on the upper part give off at each leaf-axil a alender panicle of roy-purple flowert. The plant dies to the ground
we have, and if it never fraited at all would be well worth growing. The flowers are sbout 1 inch acros, white, and produced in large flat corymbs, about the end of May. The leaver are amongat the largeat in all the Cratsgus, meaturing 4 or 5 inche in diameter. They are brondly ovate, lobed and toothed at the margin, and covered more or les with a moft pabencence. The apecien is nearly related to C. coccinea, but the latter is readily diatingaished by its glabrous leaves. The flowers of C. mollis are larger, and it ir, as an ornamental tree, superior to C. coccinea. It is widely apread in the United States, and it distribation extends as far north and mouth as Canada and Mexico respectively. W. J. B.

\section*{GODDEN GREEN.}

Thosm who are familiar with the glories of Kent, the pictareaque character of the greater part of the county, its frait orchards, and its Hop-fields, are not likely to be unacquainted with the old town of

Fig. 79 --mb. frang hudson's beidence at godden green
in the winter, and a it is said to do this even in milder latitudes than ours, it would perhaps be more correctly dencribed as herbaceous. It is hardy at Kew. It is increaved by dividing the old atools-an operation which thould be performed at intervale of a fow yearn, in any case. The pecies is found in China and Japan, and it was from the latter that it was introduced by Siebold. The plant was figured in the Gardeners' Chronicle for 1883 (vol. xx, p. 749), under the name Desmodiam pendalifloram. It is also grown sometimes an Lespedeza bicolor, a name that properly belonga to a nearly allied, but quite diatinct species, which is more truly nhrubby, and flowert aeveral weeks earlier.

\section*{Crategus mollis (Scarlet Hawthorn).}

This is One of the largeat and handmoment of the American Thorns, forming a amall apreading tree from 20 to 30 feet high. It is abandantly represented in the ground at Kew, and neveral treen were heavily fruited. The haws are about five times au large as tho of our English Hawthorn, and almost globular. It is unfortanate that the fraite do not remain a longer time on the tree, as they are montly fallen by the beginning of this month. Thin species in, however, one of the moat beatiful flowering Thoms

Sevenoake. In the immediate neighbourhood is Wildernense Park, one of the seate of Lord Hillingdon, and two milen from the town is Knole Park, the aeat and reaidence of Lord Sackville. This grand old manaion, ite immense park, and fine timber, it large and well-kept garden, and the ancient and historic character of the place itself, are all intereating. But tarning to the particular aubject of this note, we mutt drive from Sevenoski, a diatance of about \(2 \frac{3}{3}\) miles, pasing through the curious little village of Seale, thence through a park adjoining Wildernese, and on to a place called Godden Green, leaving Knole about a couple of mile to the right.
Godden Green House is nitaste on one of the eminence common in this part of Kent, and is the residence of Frank Hadson, Enq., one of the janticen for the county, and a partner in the remarkable firm of Hudson Brotherr, the provision merchantu. The house at Godden Green was bought by Mr. Hadeon about ten yeart ago, and the grounde attached thereto are something like 60 acrea. From photographe taken of the badly-cared-for place at that time, the amount of work that has been done under the direction of the present proprietor becomes apparent.

The wouth front of the reaidence is showa in the
accompanying illatration (6g.79), and though nct large, the house is very pretty. From the roof half-way to the base the walls are tiled, and below the walls are of grey atone. A grand billiardroom, and a few minor additions have been made by \(\mathrm{Mr}_{\mathrm{r}}\). Hadson, and if he had been responaible for he bailding of the whole structure, it would mons: likely have been more imponing; as mach is indicated, at least, by the new and excellent atables and other buildings which he has erected to the right of the photograph, which in ome meanure tend to belittle the house. In the garden there appear to be no favourites-no hobby-riding, but everything is done to secure general pleasure and uaefulness. Almont the whole of the groande extend from the house in west and north directions, hence there are the anual disadvantage attending a short drive from the lodge. This drive has been planted on either mide with Cedrus Deodara, now thriving well, and one aide of which may be seen in the figure. In the tarf in front of the tree there are flower beds of time-honoured character; they are raised very high, and have banked edgen of Ivy, Echeverias, and other aimilar plants. Pelargoniuma, taberous Begonias, Lobelias, and other bedding plants are uned in the bed with tate, and in aeveral combinations. Especially worthy of remark were the two bed of Heliotrope, which had thriven eo exceptionally well that we have never aeen better or neater masen of thin eweet and always popular flower. Whether such bedding is the beat to use in this position in largely a matter of tante, but the success with which it had been followed, deserved the highest praiee possible. The pleasare-ground are decidedly pretty and attractive, partly owing to the fact that they are kept well, and neatness is observed everywhere, but also to the aite itself, which has no slight influence in the same direction. From the tennil-groand and from the house windowe, are obtained views of the most pleasing description, and happily, these are not obscured by trees which thwart the purpose for which they were planted, an in the case of many lovely ground. The trees and shrub around the house are not yet large, nesily the whole of them having been planted by Mr. Hadson, who may be credited with having done a large amount of auch work; but on the other hand, there are many instances where further planting will be beneficial. Some large beds of Rhododendrons on the north side of the house have given unqualified aatisfaction aince they were overhazled by Mr . Woodward, the gardener, and plenty of cood peat given them. A bank of Ponticum and Gient hybrid Azaleas, alao on a bank at the rear of the hnuse, sloping to the wouth, create a magnificent diaplay each apring. The poaition in just a suitable one.

Very near here is the old part of the kitchen garden, now used principally for fruit, though the Asparagus-bede are also here. The vegetable garden has been made in a corner at the sonth-went extremity of the grounde, and close to a small model farm. The garden ie very mall-we ahould think too mall, but the crops howed that conniderable use is made of it. Peas, Beans, Celery, Onions, and eapecially Bruasels Sprouts looked well, but the Peas were nearly apent. Oar attention was drawn to a good lot of Aaparagus-Kale, with the remark that it wan the mout prized of the winter vegetablen. The walks are of asphalt, edged with tarred bricks. About 170 atandard fruit trees have been planted in various ponitions. Fighty of these form a belt a few feet from the extremity of the grounde, in a nice meadow, and these will probably thrive and bear well. Unfortunately the aoil is generally vert poor, and immense quantities of manure have to be applied in order to get good crops of anything.

One of the chief feature of the place in about 10 ncrer of woodland, containing plenty of moderatesized trees, and also a number of copse-ntools. The whole of this has been opened up with skirting and interesting paths, well made, and consequently clean during any weather. A very great deal of planting, too, has been carried out, in order to give the paths a more farnished appearance, and by the addition of

Hhododendrons, Laurels, Thajopais dolabrata, Abie grandis, and other Conifers in mall groups and a specimens in open apots, the wood bas been made a charming retreat daring hot weather in summer. Still mach more of the eame kind of work need to be done, and an excellent effect would follow the further planting of Rhododendrons, Aucubas, Laarels, Kalmian Irish Heaths, and other such dwarf and raeful plants.
The glasa-housea again show Mr. Hudson's regard for the naefalness of thinge. The most important of these is an excellent apan-roofed Peach-house 72 feet long, 22 feet wide, and 18 feet high. The site necessitated the aspect running nearly north to wouth. Evident, here, is the good culture the treen receive, for though the crop was gathered, we could observe the healthy appearance of the wood and leavea, and they were ripening splendidly after bearing so heavily. In order to prolong the seaton an much as possible, the following varieties are cultivated: Waterloowhich is ssid to alwaya bear a good crop of fruit here, Dymond, Halea' Early, Amaden's Jane, Bellegarde, Cundor, Early Louisp, Cricuson Galande, Sairling Castle, Princeas of Walea, Warburton Admirable, Nectarine Peach, Sea Eagle, and Barrington. Among Nectarinet are Humboldt, Rivers' Orange, Lord Napier, and Elruge. The tree were planted rather thictly, in order to furnish crop of fruit at once, and will now need thinning out a little. Other houses included a mall lean-to rosary, and another small span-roofed house, with two divisions. In one of these are permanent Vines, and in the other potVines, or Melons, according to the time of season. The pot-Vines intended for the house have been raised on the place, and they were excellent canes for the parpose. There is a lean-to vinery, and another upan-roof house, used for late Vines, in addition to the above, as well as a moderately-nized greenhoune.
We were not surprined to find that a portion of the land had been retained by Mr. Hadson for meadow-pasture. Two or three, however, infficethey are amall, but in oplendid condition. snd a few excellent Alderney cown were grazing. Mr. Hadson has atudied the dairy industry thoroughly, and has done mach in many ways with a view to popalarising dairy calture in this country, for the free-trade priaciple of our hospitable host are not inconsistent with a hope that the dairy prodacts now imported into this country in such vast measure, will give place to articles of equal quality which, it is believed, this coantry is capable of prodacing in large quantitiet. Bat the dairy queation, like that of fraitgrowing, has long been a mach-discussed surject. In conclunion, we are convinced that the satiafactory condition of the place is the realt of enthasiam on the part of proprietor and gardener alike, each of whom aecond the other's efforts.

\section*{Orohid Notes and Gleanings.}

\section*{PLEIONE LAGENARIA.}

Tyese charming little plants are making a grand nhow here at the present time. Tnere are about three dozen 5 -inch pots containing from even to nine paeado-bulbs each, and which average about twenty-eight flowern in a potiul; one pot with nine good bulb has thirty-three expanded flowers, some of the bulbe measaring 5 inches in circamference. They have been grown all throagh the seasom at the crol end of the Mexicen-houne, close to the door, where much air enters from the outaide. After they had fairly atarted into growth, they were watered two or three times a week with soot-water and liquidmanure made from horne-dung. To any one having to make battonholea or sprays they are very unefal flowers. The plant being deciduous like Calanthen, the plant should be intermized with Ferns, which Hhow them off to adrantage. W. Hurlitone, Parkfield,
Hallows. Hallow.

\section*{Catabetua tabulahe var. beachiolossun.}

In the isue of the Gardeners' Chromicle for Jaly 13, 1895, p. 43 , an illastration of Contasetum taly 13 ,
var. rhinophorum wan given, and in the accompanying note allusion was made to other known rarieties of this species. One of the most singular C. t. brachyglossum has jast flowered with Joseph Broome, Eaq., Sannybill, L!andadno (gr., Mr. Shill), who bas kindly sent the inflorescence. The very aingular and large flowers have the sepals and petals, the underside, and the ningular apturned margin of the lip and the pouch at the base, of a creamy-white colour, with a dense freckling of rose. The large Ivory-white tongue-shaped callus is \(3^{3}\) of an inch broad, 1 inch long, and nearly \(\frac{3}{3}\) of an inch thick. it was the remarkably broad, shurt, and thick callas which indaced the late Prof, Reichenbach to distinguish it by name, and evidently the pecaliarity is constant_in onessection of the speciev.

\section*{Houlletia Brocklegurstiana.}

Like many other Ochid of early introduction, this beautiful species attracts considersble attention when well calcivated and flowered. One of the finest apecimens which we have seen is now in bloom in the collection of Sir Frederick Wigan, Care Lawn, Eant Sheen. Tae plant bear tour flowerapiken, one of which bears eight fluwers, and the others aeven on each. The large wax-like flowers are Indian jellow, closely marked and tinged with parple-brown. Its fragrant flowers are borne on toat erect atem, and they arrange well with the broad arching pale-green leaven, J. \(O^{\prime} B\).

\section*{Cattleya aurea.}

There is a grana form of Cattleya aurea in fluwer at A. Wardurcon, E q.'s, Vine Lodge, Haslingden. The nankin sepals and petals are large, stand more in a plane than the typical furm, and the lip is not only large, but 18 beantifally interlaced with gold lines frum almost the extremity to the base; the glowing crimson that forms the ground colour makea a most caphivating setting. There are six fluwers fally expanded on a well-culsivated plant, the flowers atandir g cluar above the foliage on a atiffion pedicel. It is one of many grown here, and well grown, too, by Mr. Tom Loitaouse, Mr. Warburton's gardener. Tae more oue sete of thatine apecies the more is it appreciable, because of the great variety in the distribution of the coluare, particularly in the labelinm. J. A.

\section*{The Bulb Garden. \\ BELLADONNA LILIES.}

Amona the great army 0. hardy buibous plante, few can vie witn these charming plante, either from a decorative point of view, or for general chastenean and beanty. Quite anlize many of the choicer balbous plantn, these alway thrive best when let atone. Ot courne, to enaure accens, all auch thing must have been well and properiy planted, and this, too, in salcable postions; indeed, postion is one of the most important itema to ther autumate anccean, The base of a south or south-west wall is the most untabie place for them. Here they will receive that amount of an and warmth which is so condacive to healtafal progrens, and protection at other timen from the extremes of weather; not that they are tender by any mean, for while the weather is aevere they are benenth the soil. The chief element in their nuccess lie in the original planting, which must be very deep. A trenca, quite \(2 \frac{4}{5}\) feet deep, should be made with everal inche of rough matorial, for drainage, in the bottom. Unlems the original soil in fairls good to the required deptb, other woil should be aubatituted. If peat and rough leaf-soil and turfy-loam, with plenty of arp aand, to the depth of one foot, be placed beneath the balbe, thin will last them for years. The preparation of the wil, however, depends to a large extent on the nature of the original soil. Anyone who may wiah to make a specialty of these handsome bulbs, will do well to atart properly; this done, they need no further attention in this respect for a dozen yeara at leat. In districtin where the soil is not well drained, it will be best to raime the level of the
border rather than excavate to the required depth, as it in not desirable that the roots should be in or near to water in winter-time. Moreover, the will would soon our, and be unfit for the roots, and sickly plants would result. These are itema, how ever, which all will be able to decide, according to individual circuastances. In light, warm, and gravelly soils, the use of well-decayed cow-manure will be an advantaga, buried in the soil deep belom the balbs. Having the trench and drainage ready, place a sod of turf over the latter, and begia by ro placing the best soil to 12 inches deep, working in plenty of decayed manare, bat not in contact with the bulba. These latter may now be placed in position, so that the top of the bulbi shall be about 8 inches below the surface. The bulbs aholith well surrounded by sharp sand, and an additional sapply of gaod, prepared soil, without masure, bo placed in to the depth of the balbs. Make all moderately firm, and fill to the surface with ordinary soil. In exceptional intances, where from any cause the depth given cannot be obtained, the bullo may be planted nearer the aurface, provided that 6 inches of short manure or leaves be given an a mulch each winter, from November to Febraary, If good, sound, dry balbs are obtained, thene maj be planted at any time, from late autumn to end of April; but the sooner root-action commences, the better the chances of success. It is sarprising thene fine hardy bulbs are so rarely seen in private gardens, when they give so little trouble to tho cultivator. For weeks past, daring Augast and Suptember, some notable examples have been making a grand display at Kew. Such inatancer fully demonstrate their real value, and is worthy of frequent imitation. \(J\).

\section*{CATTLEYA CULTURE AT Stand hall.}

The cultivation of Cattleyas and Laliam and their varioas hybride at Stand Hall, if not phenomenal, is more than ordinarily succesfol. One conld mee in periodical visite the rising importance of that genas year by gear, until now it is a matter of common com-ment-the vigour of the plants, the quantity and quality of the flowery, and the maintenance of a sound and endaring constitation of apeciesand varieties. Mr. Statter, the genial owner of this renowned lot, it a gentleman well known for helping forward advanciog horticaltare, not only in the diatrict in which he lives, but the zeal and ardour and time which be gives in assisting the Orchid Committee of the Royal Horticultural Society in their laborious but highly useful work in rewarding aterling merit, is well known to many outaide of his own committee. The collection gathered together at Stand, no matter whether it be Cattleyas, Cypripediams, or anything else, is notable, not only for it numbers of varieties of pecies, but for the choice character of each individaal. The training experienced at the fortnightly meetinga is accountable in a great maarare for thit, as poor quality plants are intolerable in the eyer of experts, and now we have all our best-informed orchidists going for selection; hence the appreciation in value of good Orchids. But it i caltivation that we have taken as our text in this notice, and no doubt it will be interenting matter to tell, at exactly *) pen-portrayal can make it, the aybem an pric: tised in this charming Orchid home.

The house in which the chief lots of Cattleyar aro growing is about 30 feet long by 15 feet wide. It is span-rooted, standing north and south, with its perpendiculars, half brick, half wood and glane, 6 feet high. The height from floor to apex is abont 10 feet, leaving, therefore, the wloping roof on either side st about an angle of \(30^{\circ}\). This, an will be noticed by thowe who follow me, is a flat roof. The hoast is substantial, without rafters, but with strong matragals, all grooved for catching the drip, placed about 15 inches apart, ranning from the perpendicular nidet to the apex, filled in with 26 -0z. glase. There are 10 longitudinal openings on the roof, only aportures hers and there on the western alope for roof ventilation, 0 , which more anon. The brick wally are also fisted with
aperture covered with wooden ahutters, and lined in the interior with wire-gazzo. These apertures are, judgin! by the eye, about 5 feet apart, and are placed directly opposite the lower tier, or return-pipe, in the beating apparatus. There are four rown of 4 -iach piping-two flow and two retarns, which, with a usetal boiler, are fully adequate, even in this very exposed locality, to do the work in stress of weather. The interior presents a stage fally 5 feet wide on either side of a 3 -foot passage. The atage rests rather under the top of the brick side, and is of strong flaga reating on pillars arched from pillar to pillar, so that air may not be unduly impeded in pasaing from the bottom ventilatora below the stage and up through the house itself. It will be seen therefore by those who know anything about hothouse bailding, that the Stand Cattleya-house differs from most of those recently erected in not having a skeleton or doable atage. Oa the flage are placed a few inches of what appeared to the writer to be more chippinge of coal rather than charcoal. Any way, that is the covering opon which the plants in pots atand. Nearly every one on the side stages is raised on an inverted pot, and indeed this is absolutely necessary, because of the roots, which we shall advert to presently, going down like living things in earch of some apport to take hold of. The ground below on either side of the pansige, and indeed the passage itself, is covered with a thick layer of this e-called chip-coal. The path is latticed, and accumalated water, or rather surplas-water, from watering, goen down into this black mediam. The roof is shaded with a kind of lath-blinds, much brosder in the lath than usaal, I should eay 3 inches wide, and placed proportionstely wide apart, thus giving a maximum of light, and at the ame time acting an a mofficient preventative to acreen the gem within from suabarn. That comprisen the ground-work for the syatem in practice ; and now for some of the resulte of the practice itself A few sentences, however, on the reason why top. ventilation is not more liberally provided for, Both Mr. Satater and his accomplished orchidist, Mr. R Johneon, aver that half thesuccess of the cultare within is attribatable to free ventilation at the bottom, and little, or an little an practicable, at top. The old yyatem was the converse of this, and hence, whenever moistare was generated within, it went out at a gallop at the top. The condensation of moiature, particularly with a down-going san, is of the highest importance for successful Catcleya cultare. Theae flat-roofed housen, too, are capital in respect of the aun not beating too fiercely apon them. The cool atmosphere coming in from the low ventilatore makes a "wweat" home, pleasant to the olfactory nerves of an expert orchidist. Mr. Johnson nej that from May to September his bottom ventilators are seldom, if ever, ahat, "pight or day," and when the top ventilator is used, it is only for a few hours in the middle of the day-alway shat before damping down.

There are three kinde of atenails or receptacien used for calture ; first, pote mostly of common make; second, square teak baskets; and third, deep cylindrical teak baskete of rather elegant form, tapering from top to bottom. In the firt-named, the atronger apecimens of the race are growing; in the necond, the mediam lot; and in the third, the choice bits of slow and dwarfish growth, and the auxiliarien-bita cut off. Cattleya gigas the Stand Hall variety, was producing flowers 10 inches across, and such flowers with ruby negment filled ap as we like to nee them; and then the lip, gorgeone in its intennity of cardinalparple, with two great yellow ejen, one on either side, the crest lovely, a king among Cattleyas; the leaven were grand, and the root coming over the pot-rims. Then alongside of it was a very deep-coloured variety of Lxlis tenebrona, one of the greatest gem: in the grandis way in modern times, with nine pikes, each three. flowered-great flowert, too, in the height of exuberance. Leelia parparata Statteriana is atter the Hardyana type, with a lip of equal brilliancy, and the aegmente broader, and white an nowflake.

There is a mont besatiful hybrid between Lelia parparata and Cattleya Warnesi magnifica, from the Jales Hye collection, temporarily named Pariainaa \(x\), of anuaal brilliancy, and growing a way like it fellows, although not yet up to Stand Hall growth. Cattleya Johnaoni \(\times\) C. gigas and Loddigesii is very uncommon. Lælio-Catteya \(\times\) Canhamiana alba, Lwlia purparata \(\times\) Cattleya Mossiza are gems of the firat water, the roots going down quite 12 inches after fllling the pot, delighting one's eje at much at the plant iteelf. Cattleya Scatteriana, a natural hybrid of aurea type, is growing in this climate in a way which we do not often see aurea do; it roots are actually touching the cos', after dipping past pot and inverted pot, to a length from the base of nearly 2 feet; and what a gem that selected variety is !more valuable eved than many of our home-raised hybrids. La'io-Cattleya \(\times\) Poobe Leelia cinnabarina \(\times\) Cattleya Mosaiæ in quite a atrong, finely developed plant; and then how glorions the flowers! The nankin colour is empbanised, and the aize of \(L\). cinnabarina more than doabled. This is grand work on the part of the crom-breeder. Cattieya auperba alba is beantifally developed, and is likely to be shown at the fortnightly meeting (it has been so since this was written) - a capital managed plant of one of the most difficult to do of all Cattleyas. Then there is \(\times\) C. eximia, \(\times\) C. Nisa, in which the parente, C. gigas and C. crispa, are both observable, and the roots here, too, sometimes clambering on the rim and over the side of the pot, and cometimes dipping vertically, bowing abandantly to the practised eye the mitable character of the atmosphere. In houses kept is the dry order day and night this scarcely ever occurs, the roote electing to take hold of the buint-clay pot, which is the only moint mediam comesat-able for them. C. \(\times\) Macænas is in rude growth, forming double leaves to it Alowering bulb, from the centre of which the shouthapring. Cattleys crisps superba, which wa honoured with a first-clans award at the chief seat where Certificates are given, and where fow are thrown away upon oven highclase articles, wat showing dozens of flowere. The charming Lulio-Cattleya \(\times\) Ameniz, C. crispa \(X\) C. maxima, is another grand example of extra growth, and abundant root-action; indeed, many of the bybride are freer in root-action than some of the imported apecies. We matalways excapt C. labiata, the root-action in which is pronounced. It seems to be the easiest to tranaport afely, the quickent to recuperate, and freent to flower of all among the great host of sectional forms. Cattleya Rex is doing extreordinarily well. It was in bad repats as a doer at first, but here it is rampant in a good many plants, but not so variable in variety as ita compers. C. Claesiana of the C. intermedia type differs from many in respect of making its growth in winter, like Lelia ancepe and it brood. C. Bow. ringiana is a giant to grow in a climate of this kind; its pushing leads are as thick and prominent as one's thamb, and a glorions coloration it makes when in flower. The rather anique C. Mendeli leacogloma is doing grandly; indeed, the varieties of Mendeli here are of pronounced good quality, and there is no absection that command general attention so mach as this, and then the vigoar of the growths and the dark green of the leaves keep one's eve upon them. C. \(\times\) Pallan and Lamia parparata, and C. Dowiana, with its intense velvety-purple labellum, are smong the mont distinct of hybride, and the plants here show great vigour. C. \(\times\) Lord Rothechild, C. \(\times\) Gankelliana, and C. aurea has the vigour of Gavkelliana imparted to it. The wonderfully broad leaven induce long roote, pushing downwards and breaking at intervals, close intervala too, with ubsidiary onen like a crop of lateral bude on a dwarf Apple tree. No more remarkable growth for a rarity is visible than that of C. Gaskellians alba. Looking at other albinos of aimilar species, this is a veritable giant, and at white as paper. Bat this is an emporinm of raritien which wo cannot linger mach longer upon. It wat with pardonable pride that Mr. Johnmon pointed-" there are my three relected Cattleyas
that have won honoure-C. aures Statteriana, F.C C. 1890 ; C. Statteriana. F.C.C., 1892; C. Warteewiczil Countest of Derby, F.C.C. in \(1894^{\prime \prime}\) The latt in a gem of the first water, and what in gardening phraseology is called a white gigat. It hat been divided into two pieces, each ruaning neck and neck, both about showing for flower (see, for description, Gardeners' Chronic'c for Soptember 28, p. 360). Toe open cylindrical raft, letting in the air in the suepended position, evidently anits this plant.
In another house, the counterpart of the one above deacribed in detail, the Cypripediums and the Letian divide the pride of place. Lee'ia elegant in many varieties is doing well, somo pieces in rather indifferent heslth, bought in, have bean cut up , and are gaining atrength. L. ©. nobilius, Blenheimensis excellen:, Cheleoni, and one called Statteriana, with white segments and brilliant lip, attract attention.
The seedlings are grown here, and wonderfully well they look in their comparative initial atage There are some promising brood of Lalia cingabarina and Cattleya Lawrencians, of C. Banderiana and Lselia parpurata, and many others. The batches are in mall thumbs, plunged into thallow seed. pans, and as they increase in size, they are potted on and hang up on their own account. Mr. Statter is atrongly of opinion that the bent seed-bed for hybrid Cattleyae is in pots, where the plants have not been moved for two or three years, among decaying material, and where watering is of little consequence, because of the little value of the plant. Seedlinge will not do, for a time, with a season of reat, only, aingularly enougb, I never knew them to coms ap unless in the peat surrounding a living plant. Tae little embryon in a house of this kind were getting on. We never can have too many Cattleyas ; there is so much difficulty in getting a large brood from one seed-vessel - so different from Cypripediam and Dendrobiams; and Mr. Johnson would not ow a seed upon the surface of the pots where any of his choice plant are growing. Some people might ay that the extraordinary exuberance of the plante was attributable to their living in an artificial atmophere. It is not eo. The syatem here is to have a rest and a drying, at proper seasons, and, moreover, no plant is myinged or watered overhead; the moistare necenary for leaf-feeding is obtained from evaporated and condensed moistare. The material used it twothirds beat fibroan peat, and one-third bent aelected sphagnum-moss-a very common mixture. In fine, they are a marrellously fine lot of plants, looking even better now than I ever asw them; they are a comparatively amall lot, bat everyone is worth looking at, and go when you will there is momething choice in flower. \(A\).

\section*{SOOTLAND.}

MOREI_LO CHERRIES IN THE GARDENS OF SCONE PALACE, PERTHSHIRE.
Mb. WARD doe well to refer to these fine trees in particular, in the Gardeners' Chronicle, an well as to the importance of the general caltare of Morello Cherries. And an he appealn to Mr. McKinnon, who nucceeded the late Mr. Holliday as gardener at Scone, Mr. Smith of the Viceregal Lodge, Dubliny and to myself, for information about these modele of trsining and fertility, I baten to recall a few memories about them. I do this the more readily as Mr. Ward frankly confenen that the Scone trees have been his object-lessons in Morello-growing through life. Doubtlens the ame feeling has largely prevailed among the many lade and men that graduated in the gardens at Scone. It was scarcely possible for any such to plant, train, or gather Morellos anywhere without recalling the gianta they had aeen in their Scone day. There were other good features in the old gardens, bat the Morello Cherries on the north wall of the eath garden were the lions of the place.
None but the master, Mr. Jame Dodds, in my time, or Mr. Blackie the foreman, was allowed to
prane a single twig off these Morellos, and I shall not readily forget the violent quarrel that arose with a fresh joarneyman from Dicksons, in Edinbargh, miataking his orders to go and train and nail one of these trees, went to another, and began to prane and spar the giant Morello as if it had been a Mayduke or a Black or White-heart Cherry !-an act of vandalism which was threatened with instant diemienal.
Another rule about thene trees wan, that if more young wood was left than conld be laid in without overcrowding, the surplus shoots were to be brought under the notice of the mater or foreman before removal. Seldom were any but the moat experienced journeymen, or handy apprentices in their last year, allowed to train and nail thene Morello Cherry trees; and in most casen, apprentice handa were only allowed to lay in the current year's wood after all the primary, eecondary, tertiary, or other oldar branches had been diaplayed. I alao recollect several casea, after several day: had been apent on one of these fine Morellos, nome error of jadgment in the equal distribution or atraightness of the branches and shootiets would be revealed. The foreman and master, and occasionally a jary of joarneymen, would sit in judgment on the trinning and nailing. If thene were condemned, the faalty part, or the whole tree, was driven into chaos by the master, and the entire work of training and nailing begnn afresh. Hence it was with fear and trembling, somewhat atrengthened by professional pride, that mont of an took part, for the first time, in training a part of tho model Morellos on the north wall of the nonth kitchen garden at Scone.
Bat the reward was aweet, when, after a week or more labour, the tree wan finithed, and the leading journeymen, foreman, and mater pronounced it perfect, or like cantions Scotchmen, drawled out, "Yen, that will do-George-David-Bob, but that the third tertiary from the top in not quite at the ame angle all the way. No, you need not alter it again, ye've been lang enough aboot it, mon, it'll do gie weel." Grand technical training for eye and hand were these Scone Morello Cherry trees. Neither was fertility ascrificed to form nor aymmetry. From base to aummit of those 18 -feet walls (I had lately remembered them as from 2 to 4 feet lower, but have no doubt of Mr. Ward being right as to height), they were atudded with Cherries of anique colour, size, flavour. Others will probably have something to say as to soil, site, cultare. I remember nothing special of either. The Cherry-borders were surface-cropped with regetablea in the usual order, and have probably been covered with Violets and Valley Lilien, since these have been oo widely grown for the London season. The correaponding wall in the north garden used to be cropped with Gooseberries and Carranta, bat the Morello Cherry border in the sonth garden bad no bushea in my time; the site was dae north, as near as may be. The soil was a atrong loam reating on clay, and rather imperfectly drained. I wa present when a considerable portion of the garden was trenched. The manare from the atables went to the farm, and not to the garden. The chief manure for the large garden consisted of cowmanuure from the large Park, ntretching away miles from the Palace, and fully furniohed with a stock by graziers, and leaves and leaf-mould from the miles of woods. But the art of malching was not mach practived in these days, unless in the vineries, where most of the inside roots had about a foot thick of fresh or two-year-old cow-dung annually; but I do not remember the grand old Cherry treer kaving any of this atingo or other atimulant.
I think these treen partly owed their general immanity from fly and all other insect peata to the henvier rainfall and mointer climate of the north, to the holding loam in which they grew, and the heary clay on which it rested; while it cannot bo doubted that their enormous aize, long life, and annual fertility There largely doveloped and maining nautained through almost written inch, of weakly or diveary foot, I had cut out, and a fremh of wepply of or joung healthy clean wood laid in all over througtout the trees. Their
life-vigour and fruit-bearing capacity were thus renewed every year. Some will answer shortly, "Yes, it was a Cherry-noil." No doubt it was, and is to some extent. But no other Cherry trees that I can remember in the aame noil ever became models of symmetry, fertility, or longevity. D. T. Fish.

\section*{Royal Botasic Garden, Edinburgif.}

Of plants in flower recently, mention may be made of Begonia Teancheri, a tall-growing apecies, planted out in a bed in the Palm-hoase. The atronger growth measure in some instancen 6 feet or more in height, and bear large leaves of a dark green colour above, the under-sarface affased with a reddish colour. The plant in a rather shy flowerer, the inflorescence bearing not more than a dozan large pinkinh Aowers. The outer parts of the wings of the ovary are darker, while the ovary itaelf is white. Every flower examined was a female; the malen, if any are produced, having dropped whilat still unexpanded. B. Teuscheri is a native of Malaya, and although it may never become a popular plant, on account of its shy-fowering habit, it is atill worthy of a place in any collection of these planta.
Achimenes lanata. - Thir pretty little Genneraceous plant is perhaps better known under the generic name of Mandirola, and, indeed, it has some renemblance in habit to the general run of garden Achimenes, is of a dwarf habit (not more than 4 inches high) ; the foliage forms a dense mass, the under-nides of the leaver covered with a woolly pubencence. The solitary axillary manve-coloured flowers rise juat above the foliage, and change with age to purple; the lip of the corolla is atreaked with purple, and yellow apots cover the tube. When well grown, it is a plant that is almays admired, and the treatment accorded it is that uacally afforded Achimenes. It was introduced from Mexico nome yeara ago.
Mussenda luteola.-A good plant of this tropical African apecien planted out in the stove has for more than a month past been attracting notice from visitors, it being covered with flowert, which appear in terminal corymbs, every main and lateral growth bearing flowers. The showient feature of the plant is the large white or yellowish-white bracta, the flowers are of a bright yellow colour, contrasting well with the bright green foliage. Being a native of tropical Africa, it requires a brisk heat and needs no shade, Cattings strike readily. The plant when grown in a flower-pot is apt to become stunted and less prodactive of bloom, unleas accorded liberal treatment.
Plumiera alba.-The beartifal tints of the fragrant flowert of Plumiera are very agreeable in their season, although they have little claim when out of flower to be reckoned an decorative plants, they are worthy of space in our collection. Under caltivation the atems are anally unbranched and amooth, carrying a crown of leaves at the apex, abont 1 foot long. From amongat these the inflorencence rises upon a atout peduncle, and bears from twenty to thirty flower,, which expand in saccension, the plant thas continuing to flower for some time. The petals are white, shaded with yellow towards the centre of the flower, the latter being from 2 to 3 inches in diameter. A warm greenhouse in the proper place for it after the foliage has fallen, water being remewhat aparingly afforded until signs of growth reappear. Plumiera rosea and P. incarnata are two other species grown here, the latter is a native of Pera, while the specien under notice comen from India.
Jacquemontia violacea.-This in an eanily caltivated, excellent itove climber, doing beat when planted out and givan a light position near the roof, where its alender twining stems nometimes reach a length of from 15 to 20 feet; these, howerer, should be reatricted as to number, no as to prevent overcrowding of the foliege. The mooth green foliage is cordate and pointed in shape, and from the axils of the leaven spring the pedanculate cymen bearing a profusion of flowers, with light-blue, campanalate corollas, 1 inch in diameter. The plant continues to flower for several monthy during the mummer and antumn. A native of tropical America; it has long been known to cultivation, having been introduced in the early part of the present century. It in figured in the Bot. Mag., to 215151 , ander the name of
Convolvalus pentanthan. \(R\). L. Harrow.

\title{
The Herbaceous Border.
}

\section*{teleria speciosa and T. speciosis SIMA.}

The Genera Plantarum changed the name of Telekia to Baphthalmam, and as there are only four species of Buphthalmam, that work departs from its uaal habit, aud describes them all, with their synonyms. Two of them are very well known, being common garden plante. The type of the genas, B. aalicioliam (Lin.), has narrow, lanceolate leaver, dencribed by its name, and a forest of atalks apringing from the base to about a foot high, and yellow flowers less than thone of a Corn Marigold. The next generally known as Telekia specioan (Bing.) is a very coarse plant, 5 feet or more high, with broad, cordate leaves, and heads several in a bunch, a large dise, and long, narrow rays, like those of Inala glandalosa. It is figared in Bot. Mag., t. 3466. It has the habit of Inula helenium, and is a good plant to naturalise by the side of ponda. This is the plant which Mr. Frestifeld deacribes as growing in auch luxariant masees in the Cancanus, as nearly to hide a man on horseback. It is often offered in catalogues as T. speciosissima, probably for no other reason than a fondnes for aperiatives in plat names. As for the true T apeciosissima (D C.) which is described in the Genera Plantarum as intermediate between the two last menuoned, I do not than I have seen it in cultirasion, bat is said to be found in the warmer parts of the Isalian lakedistrict. The tourth species, B. inuloides (Moris) is a little known Sardinian plant. I may observe that in the Hand-liet of Herbaceous Plants iesued by authority at \(\mathrm{Kem}, \mathrm{Baphthalmam}\) allecitolium ( \(\mathrm{L} \backslash \mathrm{n}\).), and B. speciosum (Schreb), which is the same an T. apeciosa (Bing.), are by mitake made aynonymous. It is probsbly a printer's miatake, and the aecond name should have been at the same distance from the margin as the first. The two planta are certainly very distiact from one another. C. Wolley Dod, Edge Hall, Malpas.

\section*{INDIA.}

THE NEW PUBLIC-GARDENS SUPERIN. TENDENT AT NAGPUR.
We learn that Mr. John Horne Stephen, formerly of Kew, and lately carator of the Lal Bagh Botanic Gardens at Bangalore, Mysore, has been appointed Saperintendent of the Pablic Gardens at Nagpur, Central Provinces of Indis, in sacceasion to the late Mr. J. R. Ward. Mr. Ward died in Jannary last from mallpox complicated with other maladies. He had only held his post since 1813 , bat had already won general regard; his nutimely death has cat short a career of promire. "Kew Bulletin," September, 1895.

\section*{Trees and Shrubs.}

\section*{WHITE WILLOW.}

Tex Hantingdon or White Willow, Salix alba, is a tree so useful for many purposes that there is great fear, according to the September Kew Bulletin, that the supply of it may soon fall short of the demand. The bark of Salix alba is ased for tanning, and yield. salicine. The timber is emploged in tarnery, millwork, coopering, and for making cricket-bats, The charcoal is excellent for the manafacture of gunpowaer and for crayon. More than one complaint has been received 'rom bat-makers and from timber merchante, to the effect that true white Willow-wood is becoming practically unobtainable, for that, in epite of continual search for new applies, the genaine article is rarely fortheoming, and even when found
is both carce and contly.

new variety of Elder raised from Sambacus racemosa plumosa. This fresh introduction has pinnate leaves, the leaflets being again cat into linear or lanczolate segments. The colour of the leave im bright yellow, the very jo ung foliage being atriped with brown This Eider is quite hardy, and retains its colour until late in the autamos, so on all accounts should prove a valuable addition to our decorative shrabs.

\section*{The Week's Work,}

\section*{TEE ORCHID HOUSEB.}

By W. H. WHite, Orchid Grower, Bupford, Dorking.
LAELIAB. - In the house or division devoted to Mexican Orchide, Lelia albida, L. autamnalis, L. Gouldiana, L. Marriottiana, L. acuminata, or L. peduncularis, \(L\). anceps and its varietien, are now throwing up their flower-apikes. From the present time onwards until the flower-spikes have attained their full length, it is advisable to carefully examine the plant for insects, and clear them of dirt and dust, washing the pots. If the plants should require re-arranging, this may now be done. As a rale, Læias are afforded too mach water during the flowering season and the winter, whereas the roots should be kept merely moist, and a temperatare maintained afficient to fully develop the blooms ; but as mon an these are expanded, a very amall amont of water will preserve the preudo-balb plamp antil such time as growth recommences. All mpecie of Barkeria will require a aimilar treatment.
vanda tears is an Orchid that growa luxariantiy in a sunny part of the Mexican division. As regards this plant, there is nothing in the formation and completion of the season's growth to indicate the begianing of a resting season, and the grower has to be guided in this matter by the amount of growth made since the plants bloomed. If he be satisfied that sufficient growth has been made, the plant hould be kept less moist than in nummer, atill not no dry at to canse the ntems to become hrivelled, or many of the lower leavem will fall off Vanda teres, if kept in a temperature of about \(55^{\circ}\) to \(60^{\circ}\), and afforded an occasional yringing overhead on warm sunny day: will offer no difficalty, and will bloom profuely.

Cattleya bowringiana. - At the present time this plant forma the principal attraction in the Cattleys-hoase. Although its individal fowern are maller than those of mont Cuttleyas, their rich colour affords a fiae effect, and especially by artificial light. Generally, it is a plant of easy culture, it requirement being the mame as those that suit Catileyas generally. Immediately it has finiabed blooming, repotting if it sbould be required should be attended to, because in a very short period roots will atart a way from the base of the flowering balbs, and delay in potting might reault in injary to these, After the fowering is over, whether the plants have been diatarbed at the roots or not, they shoald receive only aufficient water to keep the paeadobulbs and leaves fresh-looking until growth recommences. Cattleya Percivallisna is another desirable antumnal-blooming Orchid, and this plant having completed its new peado-balbs, ahould bs kept moderately dry at the root, bat avoiding overdrynens, which may renalt in abortive flowering or deformed bloom.
sobralias have been later than usaal in flowering, but this notwithetanding, growth is already well advanced, and many large roots are coming away. If repotting or divivion seem called for, the present is a favourable time for doing either, as establishment is rapid. A healthy specimen needs conniderable pot-space, and ample drainage is very necestary. The soil used for Sobralias may consiat of lamps of fibry peat and sandy loam, with a mall quantity of aphagnum-mose, and a moderate quantity of clean crocks. In potting, keep the bace of the plant below the rim of the pot, and press the soil firmly together. When in full growth and rooting freely, Sobralias need to be plentifully sapplied with water, Towards the end of the year the breaks or tem: which have flowered, on fully eatablished plants, should be cut off at the ground-level, and the joung shoots tied out clear of each other. Sobralias ancceed well in an intermediate house the whole year.

ODONTOGLOB8UM CITROAMUM - Plant which are now sorming peeado-bolbenhould be kept in the lightest available ponition, and afforded plenty of water at the ront till growth in completed.

PIANTHB UNDWR GLABS.
By W. H. Smite, Gardener, West Dean Park, Chichute, STO E.-Allamandas, Stephanotir floribands denias should bu looked over, and all weat Diplaremoved. Saading will not be needed now. Cboon and other fine follage plants mast ba placed Crotoni glase, and in as light a position as postible. As the days becomeshorcer, it will be necesary to aue more fire-heat, bat it is batter to allow the temperatury to fall a little than to have very hot pipea, which an liable to cause insect peats to breed. A temperi. tare of \(64^{\circ}\) by night to \(75^{\circ}\) by day is quite what enough for the majority of stove plants. Kup plenty of moisture about, and fill the evaporatiey troaghs regalarly. Gloxinias should be patanay if a warm dry place underneath the greenhomenaze, where drip will not reach them. Caladinas and Gloriosas, if they have been gradually dried of, be atored in a similar situation.

CYCLAMENS.-Seediinge nown in Augant muly now be removed from the cold frame, and woy Which are fit pricked off into well-drained pans of pots, containing a compost of good loam, leafotoil, and and, merely cuvering the corms with noil Place them on a light shelf in a warm greenhome, and keep them lightly ohaded daring bright meather, A prinkling of noil should then be dusted over the seed-pans, and these pans remored to the atore so enc arrage the seed left still in the soil to germinate. Cy ciamans iatanded for towering daring the winhe and spiag a culd occasionally be affurded weak manure-water, and wask sout-water. Maintaia temperasure of aboat \(60^{\circ}\) by day, and \(50^{\circ}\) by night.

ROse house. - Ter Rose in potm for arly forcing hould now receive astention. Tae drainage must be examined, and the weat shoots cat oot. Top-dress the plants with rich unctaons loam, and add a small quaticy of finely-broken bones. Piace them in a temperatare of about \(50^{\circ}\) by night and \(60^{\circ}\) by day, and if a gentle butcom-heat can bo afforded them, so much the better. Sjringe the plants twice a day, and avoid cold draghta, or mildew will aoon appear. Tais mast be checked at once when notic \(=\) d by dasting with flowern-of. salphar,
herbaceous calceolarias should be potted into 5 bach putis a compost of good strong lonw, leaf-soil, and decayed cow-manure in a dry atate will sait them. Put ratner firmly and deeply and do not water them for a few daya alter potting. Place the plants in a cold frame near the glass, and afford plenty of air daring mild weather. Calcoolaria being very mbject to green-Ay, the plants should be lightly fumigated on ite first appearance.

CINERARIAS.-Piante from late sowingy shonld now be potted into 6 inch pots; and placed in cold frames, well covering these with mat when frost in expected. Early Cinerarias commencing to athow fluwers bould receive a top-dressing of a good fertiliser, and be placed in a little warmer tem. perature.

\section*{THE HARDY FRUIT GARDAIT.}

\section*{By W. Popr, Gardener, Highelere Castle, Newbury.}

THE GATHERING AND BTORING OF FRUIT,-Frait gathering in all the warmer parte of the connty will now generally be drawing to a close, except in the case of a few very late varietien of Apples or Peara, which, unless they come away easily from the shoot are sure to brivel. Take adrantage of eremg fine dry day for pushing on with the in gatherigg and remember that no matter how hard an Apple of Pear may be it is eavily braised, and requires aro careful handing as egge. Any fruit which may hare been atored for about a week thould be examinet, removing any fruite that how signs of decay. Wein fruit ie spread about on shelves in one layer, the examination is a light matter, but when two or more layen lay on the shelven, a good deal of care is necensery in nearching for decayed examples. Ripening Pank, require almost daily examination, at when in deciny one frait will spoil all others touching it.

FILBERTS AND NUTS of various kinds should bo atored somewhat thinly on shelves in an airy, not too dry a room, or the kernela will binide The Filberts keep longest when their hats ane retained, indeed, they then have the bent apperid ance as the densert. The frait - room being be kept cool and dark, ample ventilation beind provided at the higheat part of the root, firts good use thould be made of this for the daring few weeks in October and Nuvember, i.e., daring the time that the fruita part with a good dea
anally leade to great deal of los from the exc: sive degres of moisture contained in the air of the ronm. If it can be managed, Peara bould not be stored with Apples, the later seeping longent and beot at a lower temperature than nuits all toe varieties of Peary, except the longest leepers. It space and convenience are at command, choice Puars should be wrapped ia some light sort of paper, and atored in drawers, boxes, or large plans pote, in the case of the last covering the tops with other pota or wooden covera. Nearly all kind of Pears are improved in favour and texture by placing them in a warm place to ripen for the table. The exceptiona are varieties like D jyenó du Comice, Seckle, Lonise Bonne, and similar quick-ripening onem lavting bat s short time in use. Tae warmth to which Pears are exposed shoald not exceed \(70^{\circ}\), and only enough fruits to meet the demand ahould be hastened in this manner
coobeberries and currants. - Gooreberry and Carrant-bushe covered wich mat or material on parpose to keep the fralt to a late date, should be aucovered on fine days to allow the fruit and the ground beneath the bushe to get dry, and for the removal of decayed berriem. Where new plantations of these fruits have to be made, or gaps in exiating ones filled ap, planting may at once be proceeded with if busbes are grown at home, as the earlyplanted atuff will get established to a certain extent before hard weather sets in. A mulching of rotten manare abould be applied as soon as the planting is completed. Sach early-planted bashes start into growth in the apring as it nothing had occurred.

\section*{raspberry-plantina etc -If newplantationa} of Rapperries are to be rormed, this wort hould also be undertaken without delay, trenching the land 3 spite deep if it be good, bat not hringing the subuoul to the aufface, rather incorporaring with it plentr of whort, rich manare, and leaving it where it is. Sisf soile should ba afforded a heavy dressing of coal-ashea or and. Although an open aite is the beat for the Rupberry, yet partial hade will not hart them greatly; but care mast be taken that the noll is not impoverished by the roots of neighboaring tree. Of varietiep, Saperlative is fine and diatinct, deserving of extenaive planting; Baumforth's Suedling, Fattolf, and Fillbanket, are likewise excellent; and the yellow-fruited varieties should not bo forgoten, athey are nice for dessert.

FRUITB UNDGR GLAEB.

\section*{By Bicalabd Pareer, Gardener, Goodwood. Chichester.}

VINE8. - The Vinee in the earliest house, that i the one the forcing of which will begin in November, ehould bave by this time lost the most of their leaves and may therefore be praned. After the pruaing, the cleaning of the rods should be undertaken, uaing for the purpore bot-water and a amall quantity of soft-mop. Heving done this, which involves the looening of the Vines from the trellis, it will ba an easy matter to clean the woodwork and wally, the latter being afterward washed down with limewash, into which a wineglanful of petroleum to each gallon may be put. The crust of the borders should be remored to the depth of an inch or two, and if the aoll appars to lack water, a heavy watering thould be afforded \(b \rightarrow f o r e\) any new soil il added in the place of that taken away. A, nurface-dressing for Vines, I am now collecting the edging from the carriagedrives, which contain a good amount of harp grit, and to this ame manure is added, the whole being mixed with fresh-cre turf, old mortar or plaster, and woodanhes, and the masa turned over several times. These materiale must not be allowed to get wet before using them. The quantity prepared may be suffisiant for all the Vine-bordera. In aff rding crushed bones to the soil of Vine-borders, I fiad it better to aprinkle them on the border as the work proceeds. After the Vines and vinery are cleansed and the border top-dressed, the vinery shoald be left open up to the time of beginning to force, any froste that may occur doing good ratber than harm if they do not freezs the water in the heating apparatas.
becond - EARLY VInERY. - In thir house the Vines will require abuadance of air day and night, bat beyond ehortening the longest shoots, no pruning should be done and no leaves remnved forcibly, for to long as the leaves remain on the Vine the bude are being nupplied with material for future use. The foliage of these Vines should be well syriaged at least once a day. Do not place any description of plante in the house, fire-heat
being uaqally required at this season to protect these from injary by frost. Whare a few baches remain on the Vines, recuive turm, each with a long piece of the hout attached, and place in buttles of water, and atore in a dark, cool, dry room. The Vine will be greasly benefited it the roof-jight can be taken off the vinery, thus affording fall exposare.

MUBCAT8-Maintain a warm, dryish atmospiere to cumplete the ripening, for anless this be done these varieties do not keep atisafactorily. It is ad viable to have a regalar, gentle warmth in the pine at this season, no as to keep a temperature of abou \(60^{\circ}\) Ventilation should be carefully afforded, avoiding cold draught which cause rasting of the berries. If the bordar neede water, it should be afforded on bright morninge, and at a temperatare several degrees higher than that of the house. The bunch should be carefully looked over once a week, and decaying berrie deftly cut out of them, Any lateformed laterals may be pinched off, and the foliage \(t 0\) regalated that the man may bine on the banches.

\section*{THE KITOHEN GARDEN}

\section*{By Johm lambert, Gardener, Powis Caith, Welshpool.}

8EAKALE. - The present will be a uitable time in oone gardens to pat the first batch of roote into heat, choosing those that are the best matured; in fact, I think it is a good plan in all gardens where this unefal vegetable is mach in demand, to plant a mall bed of it in a warm, anny aspect, which, if left two yeara before taking it up to force it, will prodace boots earlier than othera in the epring. and consequantly, the crowns ripen betimes in the autumn. Chonse the white variety for the earliest forcing, as the firat very early basches of this vegetable are never quite so nicely blanched as later ones. I have tried Seakale forcing in many different way, and found that tbat a mild hot-bed made of atablemanare and leaver is the bast for the production of criap, tender Seakale. Mubbrom hounes and cellara are convenient placas for forcing the roots throaghout the winter, qesites being accessible in the worst of weather. The large and small thong of the Pearl-white vari ty should be aved for propagating purposes if stock be short, laying them in damp soil till they can be made some timo during the winter.

VEGETABLE MARROW -If it be not intended to cover the plants ap, and thes are yet fresh and in a growing atate, cut the fruits directly they are large enough for conamption. But these plant are worth the protection of cold frames so long as the day temperature is mild

\section*{}

\section*{By Bailer Wadds. Gardener, Birdsall Gardens, Fork.}

8pring flowerina plants.-If the planting o! the buda has been delajed by rainy weather, and a change to dry weather abould have taken place, the following plante, mostly emoloyed for edgings, ahould be put out:-Cerastiam, Ajaga, Arabis of variatiea Daisies, and Pansien, withoat delay, thus affording the plants a chance of getting established before the winter. \(O\) iher plante used for farnithing the bodu, viz., Wallfowers, including always B-dfont Yellow, which is one of the beat; Aariculas, Primrosen, and Primrove Polganthues Alybumb: Honenty, Sadodaria ocymoides, Silenes, Limpanthep, Erysimum Peroffskianam, and Myosotis hould be planted,
hardy annuals.-Sred of raitable pecie: may be sown in sandy losm and leaf-mould in amall pots, and placed in a cold frame or pit, and afforded air freely as soon as the seedlinge are above groand. They need protection from eevere froate, sud will bs found vary ueeful for filling up or making beds in the spring gardens. It will be very necesamry to thin out the seedlings. from time to time till there are not more than three to five left in each pot, and to keep the pots pretty clone to the glase to avoid opindling. As theso plants should not make much growth in the winter season, only enough water should bp aff orded as will keep the oil maderately moist. Clarkia elogane var, integrifora, C. palchella, and Eacharidiam concinnum make the moti charmiag of early sammer beds, raised and treated in the above manner, butaffording them a shift into \(48^{\prime}\), or 32 's early in the epring, and bedding them out in April. These plante lat much longer in flower, and do not become no wedylooking as those sown in the epring in the open ground, which flower during the hotter summer monthe.

GARDEN BHRUBBERIE8. - With the fall of the leaf the re-arrangement and tranaplanting of decidaone trees and sarabs may be andercaken, and it performance carried out in mild weather during the winter month, remembering, however, that deciduus plante recover the soonent from rootdiaturbanca the earlier in the autumn the work it done. Alwayn wait till the oil is somewhat friable and dry, or it will not run freely in amonget the roots, and the trampling of wet coils is alwaya injuriona to them, and ought to be avoided. In vils that are light, and those which readily get dry, the planting ahould be done a little deeper than in those which are retentive. If the plants removed are tall or top-heavy, staking them should be done as soon as the plants are in porition, alway using a soft wad between the bark of the stem and the atake. Large sabject are best fixed by ties of 8 inches long, fixed to three stout taken, as this prevente wind-waving, but allow of the settlement of the soil and the shrub, \&c. As a tying material of a provinional nature, etraw band answer adomirably, and later, for permanent ties, Caba bist, Willow shoots, and soft tarred string are the b-at. In removing large trees, \&c., it is beat to take out a deepiah treach at 2 to 3 feet distant from the aide, and then excavate one side of the ball, and cat through any exiating tap roote; the treacb should then ba flled in and the plant left for one year at the leate, in which period of tima new root will form at the cut sides of the ball. New beds and abrabbery bordera ahould be trenched 2 feet deep, and the sab-soil if wet left in position, but broken ap well. If the home nursery can farnishe the trees and ahrubs, and these are prepared by frequent tranaplantation, the deciduous and evergreen specien may be more satisfactorily plated at one and the ame time; otherwise large evergreen ahould be tramplanted in late pring. Good immediate effect are obtained by planting at from 4 to 5 feet apart. D jing this will involve the tran plantasion of many of the plants in three or four years, when the thinoinge will be found in excellent condition for planting elsewhere. Tiees and shraba areoften placed on turf by the aides of road. and in such case they should be stelected half-speci\(\mathrm{m} \rightarrow \mathrm{a}\), well prepared oy digging roand a year or two
before. Usally it is best to plant them at a before. Usally it is best to plant them at a sufficient diatance apart, that each may show its true character when of large aizo. In the planting of shrabberiez intended to afford warmth and shelter, deciduous flowering plants should bs but eparingly usad, and common and Portugal Laurela, Hollies, \(\mathrm{B}, \mathrm{x}\), Capressu, \& ... more largely employed. The Soa Backihornsand the red-twigged Dogwood, double and single-flowering Deniziat and Ribes, should be planted freely, their various coloured shoot when denaded of their foliage affording pleasing colourf. Lilace should be planted thialy, as the plants soon overshadow dwarfer growers, and the roote rapidly impoverish the eoil. They are more effective when planted in clumps by themselves. The proning and thioning of the ahoots of deciduous ahrubs which fl, wer on the young wood may now be commenced, the cleaning and dug ag of the border following thereon. Species which flower upon purs and the ripened thoote, should be praned when they have cessed to flower. Ouly the thinningout of shoote may be done now.

Shu-Lana Root.-The Kew Bulletin for September includes an interesting account by Dr Augustine Henry of the Sha Lang root (Dioscores rhipogonoidps) of Cbina. The specipa, we learn was first diacovered in Hong. Kong by Mr. Ford, and is known to occur plentifully in the moantain of Formosa, whence, brought down to the coast, it is used by fishermen for dyeing and tanning their netp. In China aleo it is extentively used as a dye, being enown as for dyeing coarse or "dyetive cotton," cloth, fiohiog nets, grass-cloth, and certain kind of silk, Dr. Heary further remark that:-"Tne latelypened Castoms tation on the K wangai-Annam frontiar, Langchow, is at presant the sest of the for tha jears 1889 and 1891 also allude to Dioscorea: -"The princepal article imported into Langehow in 1899 was Sur-lang . .. (over 200 tona, value £1100) It is a tuberous root, growing wild in the hilly diatricts of Tonkin. It is now to a certain extent caltivated, bat cultivation, atrange to say, deteriorates the quality. It is qually gathered in spring and early summer, and is sent from here down the west river to Canton, where it is used to dye cloth that peculiar reddish-black colour one so otten nees in the South."

\section*{EDITORIAL NOTICES.}

\section*{Advertisements should be ment to the PUBLISBER.}

Sowspapers.-C'orrespondents sending newspapers should be carefil to mark the paragraphs they wish the Editor to see.
llustratlons.-The Editor will thankfully receive and select pholographs or dravings, suitable for reprodiuction in these pages, of gardiens, or of remarkable plants, Nowers, trees, ic.; but he cannot be responsible for loss or injury.
Local News.-Corresponients will greatly oblige by sending to the Editor carly intelligence of local coents likely to be of interest to our readers, or of any matters which il is desinable to bring under the notice of horticulturists.
appointments for the ensuing week.

With the fall of Antananarivo
Madamascar. the French are complete master of Madagascar, a result generally admitted, even by the enterprising traders of other nationalities, that should not only be advantageous to the islanders themselves, but also to the world at large. Wisely administered, there should be a great future for Madagascar in the development and utilisation of its natural resouroes, and, primarily, of its enormous vegetable wealth, which, under native government, has been sadly wasted. If early and persistentlycontinued exploration and investigation count for anything, then assuredly the French have n better claim to domination in the island than any other nation. After the abandonment of the island by the Portuguese, the Frenoh attempted colonisation, the first attempt dating as far back as 1612. De Flacourt (Flacourtia), one of the earliest governors, writing in 1658, declares that Madagascar est un pays qui possède tout ce qui est nécessaire à la vie ct pourrait se passer de tous les autres.

\section*{Dcpetix Thounbs, and Commerson are} well-known names to botanists among the Frenoh explorers. The latter made large col lections, but pablished nothing; whilst the former desoribed and figured many of the curious and pecaliar plants of the island, including a volume devoted to the Orchids of Madagasoar, Mauritius, and Boarbon. This contains figures of upwarda of 100 species among them seversl of the finent Angroeoums

There were also issued, with this, six coloured folio plates, two of them representing Angracum seaquipedale. The same author made known the singular Ouvirandra, and the familiar Stephanotis. Adanson had previously described the celebrated Ravenala, and Sonnerat figured it in the narrative of his voyages to the East, early in the last quarter of the last century.

The British also had not been idle in relation to Madagasoar. Richard Boothby, a London merchant, visited the island about 1644, and wrote a glowing account of its productions. In consequence, an attempt was made to establish a factory at St. Augustine's, bat after a two-years' struggle against the natives and climate, it was abandoned.

In 1815, the English Governor of Mauritius formed a settlement at Port Luquez, in the extremenorth-east; and thisalso proved disastrous. But shortly after that date the first English missionaries established themselves in Madagascar, and from that time down to the present they have continued their labours under many vioissitudes, with varying success, and not without interruptions. They have not confined themselves to the conversion of the natives to (Christianity: they have laboured at their general education, practioal and mental ; and they have done, among other things, muoh towards making known the flora of the country, both by sending home living plants and seeds, and dried specimens. Indeed, it is almost entirely through missionaries that we in England have obtained our knowledge of Madagascar, its people and productions. Foremost comes the Rev. W. Ellis, the author of Polynesian Researches, a History of Madagascar, and other books. It was he who first brought to England living plants of Ouvirandra fenestralis (Bot. Mag., t. 4894), and sabsequently introduced O. Berneriana (Bot. Mag. t. 5076 ). Horticulture is also indebted to him for Angrecum sesquipedale (Gard. Chron., p. 253, April 11, 1857, when the original account of the plant found place in our columns), which first flowered in his own garden at Hoddesden, Herts * ; Grammatophyllam Ellisii (Bot. Mag., t, 5179), and several other remarkable plants. Many other members of the pioneers of Christianity in Madagasoar deserve mention for their exertions in the cause of science, but space will not permit. Yet there is one who has consolidated \(\dagger\) the results of his predecessors and contemporaries in the same field whom we cannot pass over. His work is specially valuable for the local information it contains, and as a summary of Mr. J. G. BAKRE's numerous papers on the collections made ohiefly by English missionaries within the last twelve or fifteen years. He roughly estimates that 50,000 square miles, or about oneeighth of the country, is clad with forest. But he goes on to Bay, that every year thousands of acres of trees are burned, to provide ashes as manure for a mere handful or two of Beans, and a few cobs, or a little Rice to be grown in the clearing. Moreover, young trees are extensively used to form stockades around the villages. In one village alone he counted 10,000 trees used in this way; and in another place no fewer than 25,000 tree had been sacrificed to make a road to remove a tombstone from the quarry! During the last twelve years the French have been equally active in collecting, and the collections have been worked out principally by the late Dr. H. Baillon. The pablications include a

\footnotetext{
- See Gar ienars Chronicle, 1867, p. 253, with a figure; and Botanical Magazine, t. 5113.
"The Flors of Madagascar," Journal of the Linnean
}
series of upwards of 300 magnificent quarto plates, representing as many peculiar plants of the island. It is estimated * that about 5000 species of Madagasoan flowering plants are represented in the herbaria of Earope, and that they belong to about 1000 genera and 144 natural orders. Contrary to the expectations of some naturalists, the flora is very similar to that of tropical Africa, having many elements in common, and exhibitiog no greater peano liarities than distant parts of the Continent Readers of this journal may be referred to several articles on Madagasoar published inttw columns in 1874 and 1875, from the pen of Captain Oliver, an authority on the geography and products of this island. The illustration now given, figs. 80 and 82 , are from his penoil,

The fourth part of the monnIndex Kewensis. mental production known as the Kew Index has just been issued, and with it the work is terminated. Wo may remind our readers that it is a list of all the properly-authenticated names of flowering plants published since the time of Linneess to the year 1885. It has been compiled by Mr. B. Daydon Jackson, under the direction of Sir Joseph Hooker, and at the expense of the late Charles Darwin. Daily use has shown us how extremely serviceable the book is to workers, and it has also proved with what care the laborious undertaking has been carried out.
The expert botanist will readily appreoiate the nature of the book; but it may be desirable to remind those who only make casual reference to it, that it is no more than it pretends to be-an index of names and references. The preoise value and signifioance of each partioular reference must necessarily be left to the stadent to determine. All that we can expeot is consistenoy and correctness of entry and of reference, and thene the unwearied patience of Mr. Jackson and the supervision of Sir Joseph Hooker have secured. Under the oircumstances just mentioned, sny elaborate explanation is perhaps not needed. Nevertheless, we had hoped that some explantion of the prinoiples upon which the list haw been compiled would have been afforded us. We should have liked to know, for instance, why one name is inserted and another rejeoted; fur these particulars we mast now look to som \({ }^{3}\) article of Mr. Jackson's in the Journal of Botany and elsewhere. Many garden names given without adequate descriptions or figures, and liable to change in the hinds of oommercial speculators, and those which are ephemeral, or speedily rendered nugatory by the death and extinotion of the plants-are, of course, not inserted. For garden parposes, howevet, some of these names would occasionally be useful as historioal evidence, and it would be a boonto have them pablished in some form. Of much greater importance, however, is the necessity for supplementary volumes, bringing the list of anthentioated names up to date, and these we shall hope to see in due time. Some means should also be taken to testify the gratitude of workers towards the compilers of this work and thas fitly commemorate its conclusion.

Brunsvigia Jobephinfe-This plant is one of the ornate large-growing South African balbs, ald very striking, with its masive paendo-bulbs corer with nameroum ailky tanics, and bearing aeason of vegetation broad, lorate, glauconfg the plat
leaves. The only thing to be asaid against leaves. The only thing to be aaid against the play
"W. B. Hemsley, in Science Progress, iiin, ppo 47740
an cultivated in gardens in that it has not generally flowered freely. But in the hand of those who study the requiremente of the species of Amaryllid. which are natives of hot, andy plains, a reasonable amount of access is attained, and especially in very warm, dry summerm. The plant maken a noble show, with its tall, stout scapes crowned with bright red flowers. The chief points to be observed in the culture of Branevigias is to withhold water early in the seaton, and when the leaves begin to
one for Brunsvigia, for we have seen the apecies under notice in flower at Kew and eoveral other places. One of the bent examples wat that exhibited by Mr. R. B Lowe, gardener to Earl Brownlow, Aehbridgy l'drk at the Royal Horticultaral Sjcietp on Augats 13 thi year, and which was mach admired, and from which our illustration (fig. 81) wat taken (eee Gar deners' Chroniols, August 17, p. 191). It is a very old inhabitant of gardens, and it is recorded that the first bulb to flower wak purchated by the
satisfactory sale resulted. The principal thinge in demand seemed to be some plendid plante catalogned at Cattleya species, but which were evidently of the C. Warscewiczii bype, than which no handsomer plant could be denired. Good healthy apecimon of the many, fine, named forms of Lelia parpurata which emanate from the Brusele firm, and equally good plants of their noted Lalio-Cathleyas of the L..C. \(\times\) elegana clast were also offered; and the fine Sjbralia Lindeni which we noted in a recent issue, and the ningular and pretty Zggopetalum Jorisianum found favour with the purchasers, if we may judge by the good prices at which they were knocked down. If Mesart. Linden continue to offer none bat really first-clans plante an on thir occasion, the succese of the venture thould be asmired.

Newgabtle and District horticultural Mutual Improvement Society.-The monthly meeting of this Society wat held at 25 , Werdgate Road, on Taenday, Ostober 8, Mr. Joun Bullock taking the chair. Mr. Lawson, Heathdale, Gosforth, exhibited a collection of twenty-two varietien of exotic Ferne, in admirable condition; and Mr. W. Laree, Northdene, Gateshead, showed blooms of Caryanthemums. An excellent paper on the caltivation of fancy Pelargoniums was read by the chairman, in which he recommended cutting atruck in the apring for making the atrongeat and healthient plants. An interestiog discussion followed, in which many took part.

Market Reporta.-It is no exceedingly rare to receive a letter like the nahj sined, and so exceedingly common to receive other of exactly opposite tenor, that we have great pleasure in publishing it:"Will you pardon me arying your Covent Garden prices are a long way from accurate. Last week I n te Peaches, \(6 s\). to \(8 s\). a dozen, and I may may-the very ame day I realised 15 s . at Munbo's, Covent Garded. R. Gilbert, Barghley Gardens, October 9.' We muat repeat that the price quoted are not exceptional onet, but averages for the week.

Complimentary Dinner and Phebenta tion.-On the occasion of Mr. Cliffe leaving Shoreham Place to take charge of Lord Egerton's gardens, Tatton Park, Cheshire, a few friends entertained him at dinner at the George Ian, Shoreham, on the evening of Friday, Ostober 4. Mr. Cliffe was afterwards presented with a handsome marble clock with inscription, at a mark of esteem.

The Arnold Arboretum.-By an arrangement recently concluded between the President and Fellows of Harvard College and the city of Bonton, important addition have been made, way Garden and Forest, to the Arnold Arboretum. Thene inclade two parcels of land with an area of about 20 acree within the boundaries of the original Arboretum, but reserved by the city for its own usen when it was eatablished; two piecen of land with an area of about 3 acrea on the north-west border of the Arboretum, and purchased by the city last year; a piece of land, the property of Harvard College, south-west of the old Arboretam, with an ares of \(67 \frac{8}{10}\) acres ; this consists of \(\&\) high, rolling, grasiy hill, the second highest land in the city of Boston. From the summit of this hill fine views are obtained; the wooded portions of the Arboretum lie at itw base; to the mouth all the Blue Hill range il in view; the waters of Masachusette Bay are seen to the mouth-eatt, and to the north and west a broken well-wooded country. With these additions the ares of the Arboretam is \(222 \frac{5}{10}\) acres; 2 f mile of drive have been finiahed and planted, and under the new arrangement the city of Bution is to conatruct \(1_{18} \frac{3}{6}\) mile of additional roads. Among the scientific garden in the Uaited Siates and Earope, only the Royal Garden at Kew, with an area of 251 acres, exceed the Arnold Arboretam in aize, and it is probably asfe to asy that no other acientific garden of auch an ares is accemible to the people of a great city or possesses such a divernified auface and nuch advantagen in the way of natural wood. The Arboretum lien entirely
wither, to place the bulbs in a eunny aituation, either in full sunshine out-of-doors or in a frame or greenhouse, to be thoroughly dried and kept in a dry atate till the flower-apiken appear, which will take place in advance of the leaves if the plant is going to flower. But if the leaves appear and get well advanced, and no flower-spike appears, it is reasonable to conclude that the bulb will not flower that seamon; and the plant should be liberally watered and grown-on until the leaven again wither, when, if kept dry, as before-mentioned, it will, in all probability, reward the cultivator with itn gorgeous display of bloom. The present seaton neems to hare been a favourable

Fomprens Jonaphisis in Holland, and on ita flowering in the garden of Malmaison, it was named in honour of her.

Linden's Orchid Sale at Stevens' Rooms. -On Thuraday, October 17, Meaare. Linden, L'Horticulture Internationale, Parc Leopold, Brussels, commenced the series of O-chid Sales announced to be held at Mr. J. C. Stevens' Roomy, 38, King Sireet, Corent Gardev, and certainly the eplendid quality of the plants eent was worthy of the occation. There was a fair attendance in the Rooms, and with the aid of the numerout commianion held by the auctioneer a fairly
within the limits of the city of Boston, and is not more than 4 mile from the oentre of popalation, being eavily reached by one line of railroad and by two lines of electric cars, while the parkway which pnites the difforent parks of the City Park Syatem, atarting from the Pablic Garden, in Arlington Sireet, in the heart of the residential quarter of the city, skirting the town of Brookline and enclosing Jamaica Pond, forms its eastern boundary and connects it with Franklin Park beyond. By this parkway the diatance from the Common to the Arboretam is 6 miles.
the effects of the frost and Drought on Baitigh Medicinal Plantb.-Theintenae and lengthened frost of last winter, followed by the extreme drought of the early anmmer, are showing as the months roll round, that the devartation has not been confined to garden cropt. Oae branch of British culture, about which little is perhaps generally known, is the growth of medicinal planta, which are now for the most part caltivated at Hitchin, Bodicote, Mitcham, and in Lincolnshire. A most intereating report on the atate of these crops was recently given in our contemporary, the Chemist and Druggist, from which we gather the following facta. From Hitchin, Messrg. Ransom \& Son reported that Lavender will be the shortest crop that has been gathered for many years. A temperatare of \(0^{\circ}\) Fahro which occarred as Hitchin and many other parts of the coantry, proved fatal to the gr-ater number of the older plants, and whole fields which last year appeared promising have been cleared and planted with other crops. The young plante, though in fairly good condition, are entimated to produce but very little flower thic year. Pappermint anffered neverely from the dry weather, the plants being short, and the yield of oil par acre being therefore considerably bslow the average. Ruemary, which is deacribed as the most delicate of the cuitivated Labiatre, was almost entirely deatroyed by the frost. Bslladonna promised well in the early part of the season, and a large crop was anticipated; the droaght, however, diminiatied the growth, and the prospecte of a good orop accordingly. The old plants of \(E\) aterium are said to be nearly all killed by the severity of the winter, bat young plants were abandant, and the field of fruit, althoagh late, was anticipated to be fairly good. Henbane was reported to vary much in different localities; in demp, low-Ifing situations about Hitchin there have been heavy cropt, bat in dry situncions the yield has been very deficient. At Budicote, near Banbary, it is anid that the winter killed at leact two-thirds of the areond biennial Henbane, and as mach of the Belladonns; the only bright picture of the medicinal planta in that locality is atated to be Raubarb, which has done remarksbly well. From the Mitcham diatrict the report stater that it would be necessary to go back more than ten years to find a season so diasatrons to the cultivation of Miat, Lavender, and \(R\) semary; the runners of the Peppermint plante were frozen, and the succeding drought completed their dentruction. Of Lavender, twentyfive per cent. of tho joung plantationa were killed by the front, and the remainiag thres-quartera having aleo suffered, only half the usual harrest was expected. Canmomiles seem to have atood the winter, and on the termination of the cold weather the plants asmued a healthy appearance, and a good crop wat almost certain.

Grabses of Tennebsee. - The Agricaltaral Wxperiment Station of the Uaivernity of Tennessee, has pablished s Bulletin containing fall deacriptions and illuatrations of all the grasses of that Scate. An none of the species is pecaliar to the 8cate, this handy manual, prepared by Mr. F. Lamson-8çibnem, Will be of greet serviee to botaniete and agricalcurista throaghout the North-eatern Scates gonerally. Mr. Uaited States Dspartment "Agrotologite" to the Uaited Statee \(D_{\text {spartment of Agriculture at at }}\) Washsdranced to have suoh offlears in we are sufficiently sdranced to have swoh offlears in our Agricultural
Department.

Fauit Pregeavation in Tranait.-We take the following from the Yorkshire Daily Post of October 3, 1895:-Th latost +x periment in fruit preserving in decidedly novel. Sir Sade Samole the Arent. Gsaeral for Naw \(S\) ath Wales, has just received at his London office a parcel of fruit despatched from Sydney at the end of Jaly, which has been preserved in tranait not in an ice chamber, bat by an innocuons coating which excludes the air and arresta decay. The exact nature of the preparation is not disclosed, bat it would appear to be nomething of the natare of collodion, and Oranges, Lemons, and Pine-apples, by being simply dipped in it, are coated with the preservative, which easily peels off, and is said to caune no deterioration in the quality of the fruit. Of course, only hard fruit can be thas treated, and at present the method is in the experimental atage, bat ite development will be watched with interest, in view of the large trade which has aprung ap with New South Wales and Australia generally in fruit for winter and spring consamption in England.

Imported Plants at Santa Barbara, We have received from Di. F. Francescit hir brochure, entitled Santa Barbara Exotic Flora: a Handbook of Plants from Foreign Countries grown at Santa Barbara, California. This descriptive catalogue of plants speake well for the climate of their new country, as native of such diverse climes there do well and flourish. Dae tribate shoald also be paid to the enterprise of the planters, who, for variona atilitarian parposes, have succeeded in acclimatising no many valuable species ; and also to Dr. Franceschi, whose careful Handbook should eerve both now and in the fatare to prove what hae been done, and what may yet be accomplished in this direction.
"Hortus Fluminenais."-Siñor J. Bakbo-a Rodriauss bas published, under the above title, a brief account of the Botanic Garden of Rio de Janeiro, compiled to serve the requirement of visitors. It is written in the Portacuese langage, and contains a brief history of the garden. The existing eatablishment dates from 1808. A dercriptive list of the principal species caltivated, arranged under the natural ordera up to Compositro, is given, and some photographic illustrations, serving to show the beanty of this renowned garden. The famous Palm avenue was planted in 1843.

Roses.-The pablication of an eighth edition of Mr. William Paul's book on Roses and Rose Culture is in itself proof of the atility of the work. We can therefore heartily commend it to such of our Roseloving readers who do not already avail themelves of tha instractions contained in it. The pablabers are Simpitin, Marshall, Hamlion, Kent, \& Co.

Paebentation,-On Saturday afternood, Oet. 5 , a depatation of the Chipponham Horticalearal Society waited on the president, John Gladstone, Esq., at Bowden Park, and presented him with a Silver Medal in commemoration of the nilver anniveraary of the nociety. The medal, which was richly emboned and inseribed, was presented by Mr. A. Wriatr, the secretary, and anitably acknowledged by the recipient.

Missine Links. - Commenting at the late meeting of the British Association at Ipssich, on the botanical work of the late Professor Williamson, of Manchester, Df. Scott showed that the Calamarix were allied to Equisetacex but possessing a cambium as in exiating Dicotyledons and Gigmoaperms. The Sphenophyllew have no living repreentasives; the Lycopodiactso were represented by Sigillarias and Lepidodendron, which, however, ponsensed cambium. The Lyginodendrese consist of plante with the foliage of Fercs, bat, according to the report in Natkre, with atems and rootu resembling thove of Cycado. In this connection the existing Stangeria is of interest.

Panalum edule.-The poisonons principle of thin plant has been abown to be hydrocyanic acid. \(\mathrm{Dr}_{\mathrm{o}}\) Tamus, the Director of the Botanic Gardens at

Baitanzorg, is of opinion that hydrocyanic acid is one of the first subatances in the manufacture of proteids, and the first viaible reacult of the aborption of inorganic nitrogen.

Cambridge Univerbity.-We learn thas the library and herbariacu of the late Profesior Babingo ton have been bequeathed to the Uaiversity. Tap fiae collection of shells made by the late Min Sar has also been left to the Univereity.

Gynerium jubatum.-Mr. W. E. Goublator obligingly sende us a spike of this apecies, which in its airy lightness, and the silvery lautre of ith florets, exceeds in beauty the ordinary form \(W_{r}\), Gumbleton telle us that it is lene hardy than bo other specien. Gyneriam jabatum is a mitino d Ecuador, and was firat noticed in the Reve Hortion, 1878, p. 449.
"Cider."-This is the title of a new illatrated monthly journal devoted to the interents of cider and perry, and is the official organ of the National Association of Cider Makers. Director and editor, E. SAm:on; pablishing office, 15 , Lincoln's lun Fielca. The anbject-matter of this magaino is explained by the citle, and will prove of interest is growers, vendors, and eellers of Apples, as well us to those immediateiy connected with the manafacturo of cider. Tae price of the magazine is aizpence, and it is composed of two duz?n clearly-printed paget, interspersed here and there with an illautration.
"The Case against Butcher's Meat."- pamphlet has been sent us which bears this name, and is written by Mr. Charles W. Formapo (London: The Inarance Paolication Dapồ B, Dorset Street; Ideal Publishing Union, Memoriul Hall ; and Mancheater: Vegetarian Society, 9, Petur Street). This amall book warmily advocater a nono fleah diet, and in it the anthor argues out to his onn atisfaction many reasona, baved on consideration of health, bumanity, and morality, why a dist of butcher's meat is wrong for mankind.

Mead and Honey.-Mead, and Hono to Naho It, and Honey and its Uses, are the titles of two mull pamphleta by the \(R \rightarrow\). Gerard N. Bancers, pablinhed by Perry \& Son, Daruford and Ladgate Hill. The author recommende mead, when properly made, to the consideration of all connoissears, and he quotea the opinion of former generations as confirming hir own. Stueral recipes for preparing mead carefully and astisfactorily are given. Tue leaflet on howey speake highly of its dietetic and other virtoeth advises the ase of it warmly, and aloo gives reesipla for various diehes, which include this dninty, Tbo anthor writes clearly, and to the point,
fiae at an Eoinburgh nurgery. - A int took place last Tharsday at the nursery of Mentin R B. Laird \& Sons, Pinkhill, Murragfield. Two fire was confined entirely to the office, and Menir Latrd are afraid nome of their sutama ordert barm been deatroged, and would feel obliged by their friends who may read this paragraph kindly repeative any orders they may have givan for autuma or prith delivery.

Lemons.-A writer in a morning contenpority this week makes mention of a fine consigument of Lemona jast arrived from Auatralia, and grown os the eatate of the Aastralian Irrigation Compary, remarking that this afforded an indication of what our Auncralian friends could do in filling ap what woald otherwise be a Lemonless period. It wo happens, however, that there are just now nome refl good amples of Neapolitan and Paleroitan Lemons on the Liondon market at a fairly moderate price, 0 ar Italian friends bave been alow to move, but me fancy they are pretty well alive to the adrantere aecraing to being firat on the market, either if Manchenter or London.

The Lutovia Cheray.-Among the new id Hittle-known Cherrien received at this atation in recent years, the Latorka is one of the most pro mising of the late sour varietien. It wes imported
from Earope about twelve jeare ago by Prof. Bodd of Amep, In, who says that it is mach growa in Poland and in S.leais, as a road-sida cree. It wat firat planted at the atation in 1883. So far as observed, it is not catalogued by any nurseryman, alchoogh it is grown to some extent in weaters narveries. It appears to be worthy of extended trial as a late sour Cherry. Detcription-tree of Morello type, a vigorous krower, young branches rather alender; fruit firm, good quality, aprightly acid, at large as Eaglish Morello or largor, more nearly roand, very aimilar to that variety ia colour, but the flesh it not wo dart as that of Englieh Mirelio; clinge tenacioualy to the long etem. So far as tested hare the tree hat proved to be very prodactive, ripening its frait an late as, or later, than the Eaglian Morello. No. Y. Agrioultural Experiment Station, Geneva, N. I.

Rare Trees of West Prussia - Hert Connentz, in the Al,handlungen zur Landeskunde der Procin: West Preussen, hett. ix, 1895, paolishes an asc saut witn rigures of certain rare trees, ioclading Piras torminalis and P. suecica, the diastribution of Which through neighboariag countries is givan, Uader the head of Picus excelea (Spruce), an account is given of various curioue forme of this species, such as the Weeprog Spruce, the Columar Sp -use, and of one very curious form in which the upper branches are deflexed and appressed to the stem, whilse the lower onea are spreadiog.

Diastaje in Foliage Leaveb.-Profensor J. Reynolds Grbex, in a paper read betore the Britioh Ansociation, gave an account of a series of experiment he has been condacting on the diurnal varia. tion in the amount of diastare in foliage leaves. From this it appears that there is more diazease present in a plant in the morning than in the evening, and \(t\) ) account for this fact it has been atated that the diastase is atilised for the conversioa of atarch, but this theory is opposed to the view that ensymes do not diminish in qusotity. The author's experimente were carried out on diastase in solation and on actual leaves. In the first inatance it was noticed that on ex anure to the electric arc light or sunlight, Ti5 per cent. of the diastase was destroged. Leaves of one of the Laguminote were employed for the latter experiment. They were gashered in the moraing, end kept in the dark antil ased, when ba'f of the blade was shaded, whllot an arc light was broaght to bear on them for nine houre. It was then found that 10 per cent. of the diastane was destroged, which proportion wav increased to 20 per cent, if exposed to annlight. It will therefore be neen that the amoant deatroyed is greater in the solutions than in the living leat, and this is accoanted for by the fact that the proteids in the cells haves protective action. Pharmaceutical Journa!.

Japanese Mattina.-The demand forJapanese mattiog, probsbly made from the culme of \(L\) spironia macronata, appears, from a recent report from Hirgo sad 0 saka, to beatill increasing. Tae progress made in the manafacture of this article is more and more noticeable aach year, the export for 1824 amounting to over 277000 rolls of 10 yards each, against 227000 in 1893. The chief demand comeg from Nem York, and the quatity carried to that port by sailing vessela alone anouatod to ovar 170000 rolls, being sa average of over 12003 rolla per vessel, Which thows what an imp retant fac:or ai regards freight this indautry has asonemed. Nfor desigas of matting are conatantly being invented by the Japaneap, while the workmen are very ready to executa orders based on patterns received from foreign conatries. so that tho numbar of atyle now available to the exp orter are alm nas uniimited. The crop of Ruab from which the marting is made was particularly good aad abandant during the year, and the resulc bes been that the trade proves capable of greas expanvion without any important change in prices, to the considerable advantagy of both the Japaness and foreigners engaged in it. To all appearaces, the demand for foor matting is likely to increase in the future.

Action of Sulphufetteo Hyorocen on Plants.-M. H. Babnjubin has carried oag nome experimanta which condirm those previonaly recorded by M. Morren. Sirawbarry placta in fall leaf were expored ia the one cuse to the action of ealpharetted hydrogen gat accomptaied with free expurare to the asmosphere, whilst ia the other the plans was covered with a bell jar duriag the experimeat. Ais result, it war noticed in the firet inetance that after the gas had been a lowed to diffice through the atmosphere for esearal day the leavea bicane covared with yellowith spots, and then withered and rotbed, bat the plant recovered its normal appanrance slowly if removed to a pare atmonphere. If, on the other hand, the gus acted on the plants in a conflaed apace, the effect was much more marked, as in twenty-four houra' time all the leaves annumed a browa coloar, and hortly afterward blackned, withered, and died off, and no subsequient remoral to frabh air was able to restore the plant. M. Barnoovin conclades, therefore, that tha action of sulpharetted bydrogen 01 plants is directiy enalogoas to its action on animule (Rép de Pharmzoie, vilo, 383) ex "Pharmzo ceutical Journal.,"

\section*{BOOK NOTICE. \\ Bioloay Notes.}

Under this title Mr. Hoaston has got together the monthly veries of notes on biological mattera, issued for the basafit of the atadenta receiving technical instraction ander the auspices of the Essex County Conacil. Syme of the stadents are dentined to become tsachers in the fatare, and we have before noted the very careful and thorough training they receive in botany, zoology, and the sciences, on which agricalture and horticulture depend. Illastrations of the methods of tuition adopted, whether for elempntary or more advanced papila, are given in the present volume, and will aervo as excellent examples to others denirous of carrying out a similar scheme. The main fentare in to make the pupil verify, nin far as posible, for himself everything the teacher tells him, and then to indace him to make farther research for himself. The laboratory at Chalmoford is not only a teaching centre, but it is, as we see from the volume before ur, becoming the source whence information on plantdiseases, weede, \&c., is dios minated among the caltivators of the coanty. Those of us, who, from knowledge of what bas been done for years in Belgium and Germany in this way, have earneatly advocated the adoption of vimilar methods here, mast feel gratification at the thorough way in which the sabject is being taken up by the Easex County Conacil and other amilar bodies. Instraction in technical details and manaal performance is of primary importance no doubt, and in many cases is all that can be done, or even simed at. It is evident, howerer, that unless an adequate knowledge of general priaciples be saperadded, there is no chance of making any real progrent, or of tarning out better practitioners than our forefathers were. The proceeding at the Sammer Sshool of Horticalture hava already been detailed in fall in our coloman, so that now we need only congratalate the Council on the jadgment, zeal, and energy diaplayed by their ataff lectarer.

\section*{Home Corbegpondenoe.}

BOUQAINVILLEA EANDEAIANA.-I have on three or four occanions during the past seator seen Mr. Jamen Cypher, of Caeltenham, show fine apecimen of this form, and when well-coloured is constitates a striliag contrast to B. glabrs. The bracts are of a dark tint of mauve-purple; and in the cose of Mr. Copher's specimen, bracte and foliage alike were smaller, thoagh it was a fae example of high cultare. But an an effective exbibition plant it did not appear to me to equal B. glabra. When the latter is vigoronaly grown, and the large lntrous mauve bracte are bright in colour as well as namerous, it is a superb exhibition plant, and the frat to eatch the eye in a collection. I am afraid some exhibitort
make the mistske of atarving the plant in order to get it into flower, with the realc that the foliage is malland she lower branchen bare of leaves. To see as one socuetimes doe a eptcimen of B. glabra, bare of learea at the bsee and back, though there may be a gnod deal of colour at the sop, is to cauce one to regret that the treatmeat meted out to the plate was not more generons. B. Sanderinna ia oo diatinct in character that it can be shown as Mr. Cypher had it at Taanton in Augusc last, in the clase for twelve varieties of atove and greenhouse plant in fiower, he having alco a fiae example of B. glabra; but if spocies were required it might raise the question at to whother B. Sanderiana is really a distinct species, alchough it is, I believe, claimed asach. \(B . D\).

FRUITING OF DOUBLE PEACH.-We would Ilkè to know if it is not unasaal for the double-Gowering Peach to prodace fruit of a good sies, and excellent fivoar, out-of-doors? Whis hes been our expe-
riencs, and aleo that of one of onr customera riencs, and aluo that of one of our customers, whose tree is about ten or eleven years old, our trees bsing young nursery tock. It may brve been the exceptional aran, but the experience ia new to us. Carter Page \(\$\) Co.

CHOU DE BURGHLEY. - I bave grown this variety of Cabbage, or Cabbage-Broccoli, as it is usaally calied, for a number of jeara, but have not, so far, been able to add the earmame "Broccoli" to it, failing to discovar the alightest trace of a miniature Broccoli enveloped in the leavea, as advercised. Whether the falt reats on my inability to give it the proper treatment, or that I an not aupplied with the genuine seed, I am at a lose to know. The outward appearance is very mmilar to the Sugarloaf Cabbage, but I find it d.ffers from any otber Cabbege in point of flavour when conked, being, to my easimation, quite equal to the Braceels Sprout. especially to the prouts that epring from the base of the atem after the head is removed. Anxion to obtain itt fall value, I have grown it to come in at different earson, to ancertain if any Broccoli heade would form, and have let it remain ancat antil very late in the epring-but all to no use. Perhapa Mr. Gilbert, the raiser, will kindly let me kDow what time of the year they ahould be planted, and how long a time they should grow before a head of true Cabbage-Broccoll forms. W. Jones, Aeton Bank, Hawarden.

VERBABCUM CHAIXI AND RUDBECKIA NEWMANI - Oa looking through the tourca and lat volume, just isaned, of Iadex Kewensis, I note one or two thinge of general intereat to amateur gardeners Firat, a plant very often m-ntioned in gardening joarasls, Verbancam Chaixi (Villara), is declared to have no separate existence, but to ba identical with our native V. nigrum. Also another very tall perennial, Mallein, about which gardener write comptimes an V. Coaixi, sometimes as \(V\). vernale (Wierzbick), ometime an V. Wierzbickii (Heaffer), has lost all thew three pecific names, and in merged in V. nigrum, of which \(E\). Boisuier alwaya declared it to ba hybrid. Tben we bave Rumbeckia Nawmani (Luadon), distioguished from R. peciosa (Wenderotn), thungh no name like \(N+w-\) mani is attsched to any apecies of Radbectis, even as a synonym, in Asa Gray's Elora of North Americt; and we must hence conclude that R. Newmani (Coudon) is unknown to American botaniets, and that one of these two species is anknown in Ejglish gardens, where the two names have hitherto bupn considered ynonymous. C. Wolley Dod, Edge
Hall, Mapas.

TAIALS AT CHIEWICK. - Your correnpondent, A. D." asy, at p .336 , "a recent wrangle over the
nomenclature of \(\mathrm{B}-\mathrm{m}\), wich a purponeleas result, nomenclatare of B an, wich a purposelens result, led to the alatement being mede on behalf of Chiltrial is tried. That such in the case," explains "A. D." "is due firat, to lack of space; and wecond, taking place that season. There is," he writes, "a general ameumption in the conatry that anyone may, unsolicited, and anything at any time to Cniswick to be grown for trial, quite oblivious of the fact that one thing grown does not constitute a trial, but that resl tonts of value are found only when the best representativew of any one prodact are grown along with new comers." Adding, "it was doabtlen under these coadition that the Bean, the unfortanate object of s sarp discunion recently, was, in 1885 pat on one ide at the time, and was, with many other things, probably relegated to the dasthesp after the seed had become sterile." I ahould like to know whother the above atatement has been made
with the conaent and by the anthority of the Royal Horticultaral Society, because if not, it would be unjuat to censure it for statement made by irreapon nible persons. However, I may be allowed to say that "A. D." assumes too much in writing of the "qeneral assumption" prevailing in the country, sc. "A. D." in his appport of the atatement "that everything sent to Chiswick for trial was not tried," for the reasons, he asserts, rightly or wrongly, (1) that there wal not space, and (2) to there being no trial of the particular product taking place that veason! The Royal Horticultaral Society may well exclaim, "ave as from our friend "A. D.'!" How could there possibly be a trial of the particalar product taking place that season? seeing that my mabing Canadian Wonder French Bian was the only "Climbing French Bean" heard of (except by visitors to Lungford Castle Gardens), or anbmitted to Chiswick for trial before the above-mentioned date (April 9 1885), or for aix years later, when Mensry. Satton's Tender-and-True made its appearance. This is the annibilation of reason No. 1, and the same fate awaits reason No. 2. As it is not by any means reasonable to appose for one moment that space would not or could not be found in our national trial-garden for a short row of a novelty, namely, a French Bean bearing the written reputation of attaining to (at the time) a hitherto unheard of height- 7 feet-and heavily laden from bottom to top of bine with Canadian Wonder-like Beans of the finest quality. I repeat, is it at all likely that a novelty of the description indicated would be refused trial in the trial-garden of the Royal Horticultaral Sociest on the shallow ground mentioned by "A. D.," or that the fact of it not having been afforded a rial at Chiswick Gardens could reasonably and ratiofactorily be accounted for by the explanation elicited by the Fruit Committee at Chinwick on Sept. 10, to the effect, "we do not alway try everything that is aent un for trial at Chiawick." An adminsion which, under the circumetancer, naturally provoked a pardonable expremion of opinion from the person responsible for the introduction of the Climbing French Bean-an opinion which was entirely retronpective in ita application, and, there fore, did not in any way apply to the pretent Frsit Committee or management of the Ryyal Horticultural Society's affair. However, one thing I ventare to think the Fruit Committee might have done on the occasion referred to, without in any way compromising itself or doing anything other than a juat act. namely, recorded the fact that that body was quite natisfied, judging by the official receipt of the Royal Horticultaral Society, that my Climbing Canadian Wonder French (now Veitch'h) Bean had been sent to the Royal Horticultural Society's gardens for trial at Chiswick aix years before Tender-and-True was heard of. This mucb, I renpectfully assert, was within ite legitimate province to do. In conclusion, I should advise "A. D." who is ventilating the Climbing French Bean abject in all the horticultural papers, to let the matter rest now. In fact, I fail to see in what way he should consider it incumbent on him to take such a prominent part as he has done during the latt twelve month in the fate of the two Beans in question, but always, be it observed, advocating the claim of one to the detriment of the other. H. W. Ward.

HELENIUM GRANDICEPHALUM STRIATUM. A yellow Composite, with etriped flowers, having started from Ware's nursery a few years ago, is now becoming common in gardens under this very objoctionable name. The plant is nothing more or lea than H. nudifloram of Nuttall. The atriped ray very globular head, brown-purple diec, and pointe receptacle distinguish it from all forms of \(H\) autumnale, to which it has been attributrd by nome All these are characters of H. nudiforum. Sye Ava Grall Mlora of North America. C. Wolley Dod, Edge

ROTATION OF CROPB-In answer to your cor eapondent, "D T. F.," at p. 399 of the insue of the Gardeners' Chronicle for Ostober 5, I admit the statement "that the Cabbage tribe will thrive upon and much too poor to grow a good crop of Oaiona or Carrota, requires come qualification. We have in thir neighbourhood a field which, within the lat teu Jears, has been let out in garden allotmente. This field had been nuder ordinary arable culture but had been sadly neglected, hence fouled with weeds of the very worat kinds, and exceedingly it wat ufterly imponsible to grow aeveral yoart Carrote or Onions upon the grow a crop of either gradaally being enriched and emeliorated the soil is
cultivation and manaring, these latter crope are now becoming more frequent. The Cabbage tribe throve capitally from the first commencement of the gardens. The explanation appeara to me to be, that the Cabbage tribe, while they andoubtedly prefer an enormonsly rich soil, jet from their deeply rooting habit and robuat character of growth, are able to draw upon the store of plant-food in the subsoi (the arface-food having become exhauted), and below the root-range of the more shallow rooting crop. Also this same power from deep.rooting gave to the Cabbage a command of the wate sapplies of the subsoil not available to urface rooting plants. Of course, the texture of the soil has mach to do with the succesaful growth of any crop. While Oaions and Carrots delight in a light free working oil containing a good apply of lime the Cabbage tribe seems to do bast on the atiffe clases of land, which on analysia show a large per centage of potash and phosphoric acid in the sabsoil These different descriptions of soil best afford to the roote of the difarent plants subatances which ente directly into their atructure, J. J. Willis, Harpenden

WARE's BEGONIAS.-Another roadaide garden, but anlike the suburban one described as p. 431, is that consitting of 3 acres of land ander taberousrooted Begonias in full bloom-a very valuable crop the property of Mr. T. S. Ware, of Hale Farm Narsery, Tottenham. This is a branch nursery, and adjoin the road at Crook Ludge, Bexley Heath, about a mile distant from the town of Woolwich, on the Dartford Road. The plants number about 200,000 and they were a blaze of colour when I asw them, double and single-flowered varietien, of fine form and glowing tint. The novelties are kept in pote in the glass-houses. Mr. Pope, the manager of this nureery, is a apecialist in Bogonias, and he rias moreover the raiser of the firat hybrid tuberous-rooted Bagonia of gardens, when employed at the Exeter nursery This crom was obtained from B. Veitchii \(\times \mathrm{B}_{1}\) Pearcei, and it has the brilliant flowern of B. Veitchil with the beartifal marbled leaven of B. Pearcei, This croas was named B. Woodmanii, in compliment to the late Dr. Wm. Robt. Woodman, who had jut aucceeded his uncle, the late Mr. R. T. Pince, in the proprietorship of the Exeter Narsery. W. Napper, Chebea

THE BEABON.-On Saturday last, the 12th inat. I was driven with some friend through the Epping Forest with a view to inspect the autumnal tints, but to my murprise the foliage of the treen was an green as in Jane or Jaly. Perhaps some of your readers will be good enough to etate whether auch an abnormal atate existe in other countien. It has been attributed to the absence of frost, but I doubt not horticulturists may be able to give other reasons. I spoke to a few people at Loughton close by, who never before remembered the forent remaining so green at, auch a late period of the year. In Leicenternhire in Augast I saw in the garden of a friend an Apple-tree both in fruit and blomom, and I heard in Esaex that person there had witnemed the same thing. \(C\).
peppermint culture.-Mesarn. G. \& J. Miller, Mitcham, extenaive growern of Peppermit for dis tillation, find-firat, that Mitcham soil is almont the only soil about London that will grow this Mint profitably; and, econd, that when a crop has been grown for four yeari, the ordinary time, that, so much is the moil exhauted of the constituent which producen the essential oil, that it is useless to plant the wame ground under twenty years. Conld it be shown what that neadful conatituent is, and whether it could be artificially supplied in any form of dreasing? A. D. [Ooly by analyais.-E1]

THE CULTIVATION OF THE ENGLIBH BHOW TULIPA. - It in both gratirying and encouraging to learn that the efforts which have been made daring the last few years, to resuscitate in the sonth the cultivation of that faccinating florist's flower, the amateur's Eaglith Tulip, are meeting with no mach influential support, so much so, that an annual Talip Exhibition in London, in conjunction with the leading flower shows, may in the future be considered a settled question! Toe Talip exhibitions held in London late year and this, could only be looked upon as auccemful, enpecially an the exhibitors had no choice as to the date of exhibition, and consequently, the Talip blooms could not be shown in the highent atate of perfection; they were, however, uafficiently attractive to call forth the admirstion of all pernons touched with the love of florist's flowert, and many were not surprised, after minute examination of their exquisite purity, shape, and
refinement in marking, that their fathern and gravedfather should have been so infatuated in the cultivstion of them. Money prizen, although not high in amount, were given, bat the handsome Silver Medele awarded by the Ryyal Horticultural Society, and Mesara. Barr \& Son, of Covent Garden, were highly appreciated by those exhibitors who were fortanaty enough to win them. I understand that Menm. Barr are atill adding to their leviathan atock, feelin assured that the time is not far distant when the Eaglish Talips will be caltivated in the soath by amateure, al extensively as they are at the premet time cultimated in the north. I have cultivatad for nearly half a century, aimost every deacription a florist's flowers, and I can reiterate sincerely whes have heard the late Doctor Hardy way on muy occasions, "that of all the pleasures which mab derived from the caltivation of florist's flower, noon are so great and charming as thone experiencal by the growers of the Eaglish Show Tulip!" Thetim having now arrived for Tulip planting, amateurs who may feel inclined to give their caltivation a trial, ahould lose no time in obtaining a amall collection, the price of which is a very nominal aum. Jany Thurstan, The Green, Cannock.

Vale of cleveland potato. - When rocently in Lincolnahire I inapected a plantation of early varieties of Potatos grown to teat their earliness and cropping qualities for market purposen. It has been atated that in the Boaton diatert considerable breadth of early Potatos are mrown the aoil, position, and method of calture adopted favouring precocious ripening; and conaiderable came are made by the growers by getting early produce into the varione marketa. Among the varietien tested are Vale of Cleveland and Sharpó Victor, and I could detect no difference between them-in growth, in haulm, and in the shape and colour of the tubers. On making enquiries as to the origin of the Vale of Cleveland Potato, I found it wh raised by the late Mr, Geo. C. Short, nurnerymanand seediman, Stokenley, who described it as a meedling raised from a crons between the Early Rose and th old Ashtop Kidney. The atock of this Potato wha it is said, aold to Mesars. Charlen Sharpe \& Son, it the early part of 1879, and hortly after Sharpo: Victor was pat into commerce; and Mr. Short on testing Victor, pronounced it to be identical with hit Vale of Cleveland. Ansuming these facts to be correc it will account for the similarity I observed in the trial above referred to. I think it is claimed tha Victor was raised by Mr. R. Nigbett, for many jean gardener at Aswarby Hall, Lincolnshire, and lattorl at Cliveden, Maioenhesd; and the question fairl rises-did two men working in the same direction ach raise a Potato perfectly alike? Bat it should be atated there are two Victors in the fiold, one: yellow-fleshed tuber, which is said to be the origina and true form of the Potato, and a white-fentel form, which is said not to be so good. It is claimed or Mr. Nisbett that he raisel Victor from Almi Kidney, at one time a popular early variety, and bith Eld Early Short-top Round. Did one raise th ellow-fleshed, and the other the white-fleshed form. For it is well known that seedling Potatos raiced from definite crossen vary conaiderably, not only in the int of the flesh, bat also in abape and coloar of kin. In the particular trial of early varietied and which I have referred, both Vale of Cleveland a Victor were yellow-fleshed. I am quite anable named ansign a reasno why Mr. Short of Scokenley nan his seedling Vale of Clevoland, anless that is locs amme for the district in which he resided. I hare eferred to this matter because I fiod that Valo Cleveland and Victor are being cultivated andiel different names though to all appearance identice R. \(D\) 。

\section*{Nur8ERY NOTE8.}

MESSRS. J. CHEAL AND SON3.
If farther illustration of the extent of the iemosil Apple crop were needed, this and much other viat to resting information was afforded by a recent nese art the nurweries near Crawley. Wo believe fues and generally thought to be in Suasex, probsbly bection Crawley in the post town, and the nearest theland it there. As a matter of fact, the whole of gill generilly in Surrey, and the vivitor from London will gridg" find it moat convenient to book to "Threo bat ratior station, from whence the narseries are distablantiod more than two miles. The soil in the neighbout
- very heavy, and there in no trace of chalk, nor much lime, at the chalk only approachet at clone as the neareat "downs." The nursery itself is, in large measare, reclaimed land from Lowfield Heath, and consiat of better surface woil than that which arrounds it, inamuch as it is lighter and more workable.
Apple nually do well here, bat the crops this aeanon are extraordinary. A large tree of Besm Pool, near Mr. Cheal's residence, attracted our attention, at it was covered with an abundance of good-nized, well-coloured fruite. "Yes," anid our guide, "that is jast a fair instance of the
until February. Then is seen a good crop of Washington, the frnit well coloured and large; it in a good demert variety, bat too tender at a rale in this diatrict. Yorkahire Beauty is atrongly recommended to growers who have a cold soil as a culinary variety, being thoroughly hardy; the fruit are yellow-coloured, with bright cheek, and of good aize Jefferson is a soft-fruited variety for deasert, very pretty, but not planted in many gardens ; ome very fine fruite of it were noticed. Passing many varietien, mont of them with large crops, we come to Lanberger Rainette, an excellent Apple, good for both kitchen and densert, and a faithful cropper; it in in
quality. Margil and Lady Henniker, Coz' Pomona, and the pretty fruite of Colonel Vaughan were numerous and good. Beauty of Kent, an exceedingly pretty and uneful culinary Apple, though not one of the most maitable for the locality, had rome veis good fruits; nor have we ever meen better apecimens of Royal Jabilee than Mearrs. Cheal have in their fruit room: they are aplendid fraitn.

Tarning from the fraiting-treen to the nurseryground, there are stocks of Apple, Pear. Plum, ald Cherry-trees, and a leaser quantity of Peaches in trained and untrained apecimens. Apples two an 1 three years old on Crab atocks, and other upon the

Fig. 82.-a rofal garden in madagascab. (sre p. 460.)
remarkable character of the reaaon. Bens Puol is a variety which by reason of the cold abooil mataren but poorly here, and that tree has never daring the last fourteen years, to my personal knowledge, borne ach a crop of fine frait as you now see. Coz's Orange Pippin, Washington, and such varieties, are alro wonderfally superior in quality than we generally have them." In a closely adjacont apot are lept a fow trees of a good many varietiea for the convenience of vinitora who may wish to inspect the trees when in fruit without walking through the whole of the groands. Here was first remarked a tree bearing an abundant crop of one of the best of demert Apples Ros Nonpareil. For cold moily none is better, and the quality of the russety fruit is good; it is in use about the beginning of November, but will lat
use at hit sesson, atd will be good antil the end of the year. Hoary Morning does not usually bear many of ite pretty fruits in this district, bat there were good crops when these notes were taken. We shonld not class this variety higher than third-rate in quality, although it bear heavily. King Pippin and Ribeton Pippin, very well known, need no remark, but the crop each was carrying attracted our notice; as did Hormend's Pearmain, which was marvellous-this is good Apple, but more waitable for cooking than consuming raw, though it is mometimes used for both purposen. A tree with a crop of excellent fruits of Lord Lennox was interenting, as we have not asen the variety for come years. It is ementially a midland county Apple, and thore we have seen it; the fruit is high-coloured, rather amall, and of vary good

Paradiee, wo noticed in considerable quantity; ansi maident on either stock had made a good growth. Pears, like the Apples, may bo seen of differing aize and age on the Quince and on the free or Pear tock, and the young trees were fat ripening their growthe.

The atocks, which have been badded this seacon, in most cases are good and strong, in other again they are weaker on account of the dry hot apring following on the severe frost. Among trained trees, the most popular style at these nurnerie is the cordon, and it is made a specialty. We noticed a lot of excellent cordon Pears three jears old, studded thickly with good fruit buds, and very healthy. These trees, if planted againat a wall, would bear good crops of fruit at once. The syatem is certainly one by which all may be quickly and
profitably covered, and also one which will produce really fine exhibition fraite, bat it muet be remembered that some varieties are less anitable for auch treatment than othera. The narsery groundt, as nome of our readers will remember, are divided by a conviderabla number of thick, high hedgerowe of Hornbeam, Thorn, and other plants, which are invaluable an protection from winds. There is a compact piece of land entirely devoted to young frait trees, known an the "8 acres." Here we thought were the kindeat-looking, most promising of all the stock. A nongst the Apples notice was made of the two varieties that Messry. Cheal sent out a year or two ago. The first is Armorel (figured in Gardeners' Chronicle, March 4.1893), a rather small rusuety-densert kind of very high quality; it is exceadiagly late, and may be had in gond condition in May. Atalanta (figared in Gardeners' Chronicle, March 11, 1893), is a larger Apple, pale yellow in colour, with apare red atreaking on one side, and is fit for calinary and densert parposes; it comes into nse about November, and is an ancommoaly good cropper.

Now we have to apeak of another Apple, called Bismarck, because this variety furnished an instance of precocione, heavy bearing that we do not rempmber to have seen equalled. Eighteen rods and a half were covered with Bismarck trees of two years old apon the Doacin. Many of these had eleven, a few twelve, large fraits upon them, and nome had none. Now all the fruits on this piece of land were counted, and the total divided by the number of trees, which gave an average of five to each tree. The treen are plauted in roxs about 3 feet apart, and the plants about a foot asunder. An acre of land cropped in such a manner would yield about 500 baeheln of fruit per acre.

Treas and Shrubs, Dahlias, \&ce. - Mears. Cheal cultivate a great many other abjects than fruit trees, and it would be hardly fair to conclade this note without some reference-though it mast bs only reference-to the atock of ornamental trees and shrabs, Conifers and other plants usefal for the farnishing and embellishment of plessure-groande. Mr. Jo. Cheal being frequently employed in laying out new grounde, and in the improvement of existing ones, a collection of the beat kinds of auch plants is very necessary. Considerable quantities of Rhododendrons of choice varietien grafted on a common atock were noticed, and others which had been so treated a season or two back appeared to be very happy; nor were many of the varietien of Conifers in a leas healthy condition. The Silver Poplars, and other shrubs and trees with variegated or coloured foliage, might be remarked upon, but we must clone after mentioning the Dahlias. Tue firm has an excellent repatation for these showy autumn-flowering plante, and the Lowield collectione are a very familiar uight at mont of the exhibitions. Oaly a fortnight or ago we figared a novelty in the Cactus section for which Meners. Cheal received an Award of Merit from the Royal Hort. Society at the Chiswick meoting; thia was Mrs. Wilson Noble, a variaty of much excellence.
The date when these notes were taken was a late one to visit the Dahlia-grounds, and the plante were very thirsty-looking in the absence of the rain they have aince recerved, but plants of the variety just mentioned wore remarked, and a fine atock of Matchless and Mra. Montefiore, a trae Cactus like bloon, and a better habited plant than many of the older onew, the flower-stems being mach lonzer than is unasl in anch varietiea as Lady Penzance and nearly all others. The bloome were thoroughly well above the foliage. Pompons to our mind are not lens effective than any of the typer, and new ones that may be mentioned are Annie Holton, scarleterimeon, with ailver tipn, very high cantre; and Rovebud, which hat a light ground, and is Thamb type of Dahlins astil wrowing saw the Tom previous experience with thewing in theme nurserien, gether favourable. Here ther looked been altowere blooming in profusion, and some of the rariesien
bear the flowern only 11 inchea above the groundlevel, othern 14 and 20 inches high. The varieties Canary. Fairy Msave, and Dsiay, the last-named being 20 inches high, with good dark blooms, were remarked, and Grom, pale yellow; Tomtit, carlet with yellow rim round diac; Mignonne, mauve, with white rim round disc; and Hoop La, marooncrimson, with light ring, were pretty. This type of single-flowered Dahlia raised by Mr. Girdlestone ir, of course, only aitsble for bedding purposes.

\section*{Mr. Henby Brownhill's Seed Stores, Sale, Manchester.}

All about Cheshire, within convenient proximity to Machester, there are plant and seed farms which evidently pay better than the varions subjects of agricaltare. The land in low-lying, and the marahes are sufficient even in dry measona to keep up the natriment ngeded for a crop of flowers. Many of the growers here about grow for the market alone, and the buadles of flowers of all sorte thas are cut twice a woek-in fact, every moraing-and which fiad a ready ale in town at a price, are astonibhing. The trade in this way ha grown immensely, and the teeming thousand that flock into Manchester almost every day, but particalarly at week enda, from the deasely poparated places of Yorkshire, Lasacashire, and Caysurro use up large quatities of them. Mr. Biunnhill, in addition to hia local trade, growa largely in the seed way for the general market, and in this way ho has a grand how of flowers all through the season. Histock of aunaza, comprising Everlastings, Astera, Stocks, Gsillardias, Centararas, Caryanthemams, Poppies, Zinnias, Seabiosas, Mignonette, and so forth, cover a conaiderable aras, and are selected with the greaseat of care. His stock, too, of such things as Giadioli of the Brencalejensis section is notable, although, he ays himself, since the drainage operations came into force about his neighbourhood, he cannot grow the same sized balbs. The plants were beautiful and healthy, bat bottom moistare is mach relisbed by them. The scarlet is the popular colour in these Sword Lilies. White in Astera, in Stocks, in Gaillardian, in Dahlias, aye, even in Bagonias take well.

This is a special mart for taberous Begonian, which are bedded-out galore both out-of-doors and in the houses covered with glan for them alone. In double Bagoniaa particularly, there is a large and eelected lot. Whenever momething better turn up in the eedling way than any of the type, it takes the place of the discarded ones. Really, the gain in doubie Bagonias is very marked, more particularly on those sort that are as double and as formal as a Csmellie. Many partake of the Holly hock form, and are heavy mansen of florets, oo heavy, in fact, that the flower bend over and require to be lifted up to be seen to advantage. Among some of the most striking of the Sale noveltien are Dr. W. G. Grace, a finely-formeủ rose; E W. Powell, grandly imbricated, and having the Picotee edging, which is mach sought after by the crose breeder; Modiste is a beantiful marked variety; Baaty of Sale is an immense flower of bight colour; and amongat pinke, Wobert Haghes is very telling, and so is Linnie, W. F. Bmollet and G. R. Ward are among the best of yellow. Iadoors they are really beautifal when you see them by the thousand, and outdoora, in anything like weather, they make grand bod..
Rosen, particalarly Teas, are largely grown indoors, both as atandard plants, allowed to roam as they like, and as climbers in the ordinary way. Oae of the most useful is Boagére, because of its standing longer when cat, which is of commercial importance. Nipheto still stand it ground among whites, and the climbing Niphetos is mach appreciated as a good paying variety. Among others, Madame Hoste is grown more than Maróchal Niel, and then Grace Darliag, Catherine Mermet, and the Bride are chief among others. The old Géant de Batailles, as an H.P., it grown here, and proves one of the beat of
market Roses.

There are quantitien of created Pteris grown, chief among them formarket being sempervirenn, a good grower, and a captivating plant. Uae Pceris anmed

Oaverardi was a dwarf beautiful form, with undulating pinnm, and wo dwarf and bushy, sa to make it an eligible plant for table decoration.

A large crop wa being harvested of a new Pas called Rentpayer. It is a cross between Maclean's Little Gem and Dake of Albany. It is a remat able gain in its atiff habit, sbout as atout asa Wiodso Baan in the atalk, and remarkably dwarf, bearing aboat an average of ten peas in a pod of typical wias. The pods were borne in cluater about two-shirds up the stem, and the heaviest manared plotedidnet produce stalks more than 30 inches long. Viator,

\section*{ROYAL HORTICULTURAL}

Octobrer 15.-Owing to the vegetable exhibition held at Chiswick in September, and the great ition of British-grown fruits at the Cryatal Palace on the \(26 \mathrm{th}, 27 \mathrm{th}\), and 28 h of the tame month. tho meeting held in the Drull Hall, James Sareet, Went. mioster, on Tuesday laut, is the first that has taken place in the builoing since August 27. Os the occasion under notice there were plenty of exhibite before the committees. Orchid were namerous; Chrysanthemams occapiod a considerable share of apace and attention ; and several groaps of a mitcellaneous description were important. Fruits were again largely exhibited, more especially Apples and Pears ; and new Melons, Applea, Poars, and Grapen, a seedling Plum, \&c., gave this committee ample cope for their discriminating qualities. Of vegetablet there was ataged one of the very finent collectiont ever exhibited in the hall.

\section*{Floral Committee.}

Present: W. Marshall, Esq., in the chair; with Menarb. J Fraser, O. Thomas, C. T. Druery, B. B. May. H. Herbss, J. H. Fitt, R. Owen, R Dena, G. Stevens, C. J. Sater, J. Jenninge, H. Cannell, H. J. Jonee, H. Brincoe Ironside, E. Beckett, J, Walker, C E Pearnon, E. Mawley, C. E Shat, J. D. Pawle. J. T. Benneat Pu, H. Tarnar, G. Paul, R\&v. H. H. D'Ombrain, C. Blick, G. Nichoinon, and C. Jeffrien.

A large and excellent collection of Crotons, ayranged in a croup, was exhibited by Mr. H. B, May, Dyson' Lane Nursery, Upper Edmonton. The broad and medium-leared varieties Thomsoni, Newmani, Massangeana, Motii, and roser-pictus were noticeable for their colour; also finer reaved sorts, as Mrs. Dorman, nobilis, formosus, majesleaved sorts, as Mrs. Dorman, nobilis, formosus, a ferm
ticus ruberrimus, Flambeav, and elegantissimus. plants of a new yellow Carnation named Primarose Day were also included, and a crimson-scarlet one named Leonides (Silver-gilt Flora Medal).
A collection of Nepenthes and stove decorative foliage plants was shown by Earl Percy, Syon House, Brentoord (gron Mr. Wythes). The Nepenthes were very praiseworthy, and carried a fine lot of pitchers. Inc uded were such vaneties as Mas ersiana, Rufflesiana, Hookeriana, Amesiana, Dickionian, the new and handsome mixta, sormosa, Wriglegana, Curtisil the new and handsome
superba (Guld Medal).
Mro. Wingrield, Ampthill Eouse, Ampthill (gr., Mr, W. J. Eoppson), had a group of emall Crotons, Aralisa, and other foliage plants, backed by a few specimens of Amania excelsa Medal).
Dabliay have not yet been cut by frost in the Tottemham district, for Mr. Thos. S. WARE, Hale Farm Nureerien, staged a large collection of flowers of the single type, very remarmin in quality and freshuess for so late a date. A few Nerinemin in quality and freshuess fore Mro showa by Mr. ARE (Silver Flora Meda). A. LaUrie, Euq., Rockdale. Serenoula (gr, Mr. R Frand exhibited a dozen plants of a seedling yellow-leared pala \& gonium, but as exhibited the variety is not valuable. A plant in flower of Hippeastrum striatum maculatum 10 -inch pot, beariog about eighteen scapes of flower, exhibited by H. G. E. Green, Esq., King's Ford, Colobeetern (gr., Mr. T. H. Kettle). Mr. O. Thomas, Frogmore Garinen, oxhibited blooms of a new Violet named Princess ond of i the flowers are very large, pleasantly fragrant, aid pretty blue, with a dietinct white eye (Award of Merit). \(\AA\) bie pretty biue, with a distinct white eye (award o plant of Abium Douglasi glauca pendula, shown by Messrs. Mesara. Jas. Veilich \& Sung, Cheises, exbibited a fine lot of fruits of the new large ant exceedingly ornamental Pbysilis the proseut ocession these columns, (het 13. 1894. p. 441. On clans Crest octiate. Meara plant was recomontoded a First clas Criftheate. Mesara. Verach had al-u some well-grow Whats of Litium Ong thapum Karris in in llower.
By Meary. F Sasurir a Co. St. Albans, were exhibited
some firie fol age Piliar Begonias : Prince of wo some firat folage Piliar Begonias: Prince of Wales and Prin cess of Wates are of a very pretty metalue sia le; and Duke of Yors aud Luctes, of York have mure colour, and are of much decorative valus. A very fine platat of Sarraceaia Drummondi majir was also bhown (Cuitural Cummendation), and a few \(\mathrm{H}_{3}\) brid sonerilas.
A headutiful Nerine Moore; of bripht scarlet hue; N. Meadombuntii. of demp rose; N. raraicosis, and N. flemuosa Were shown by Mesmis. B. S. Williama a zon, Paradiee and Victoria Nurseries, N.
Frow Mesars. H. Canneli, \& Sow, Swanley, came some excellent trusses of zanal Pelarganiums: Madnme Brament, the centre of the bloom: Bell- Allian e, white, whthat central pateh of pimand duts, fatie novel; Iat y Newion, seaple!

 crian ron of a pleasing fint. From the eame aud Nan y. hight criman of a pleawng fint. From the mame nupary were exfiae large fragrawt single-flowriped Violet Princess of Wales. The vartety hay a long thuner-stalk.
Messps. Yatcl \& Sun, The Old Nupserg, Cheshunt, had a select, if ymall, collection of flowers of hary. Cherbaceous plants, Including Phomes decutata. Henry Marger, Aurore, and cranus. Heleniums, Astrantia, Rudbeckiaserata, Stokesia phaniums, \&e.
The tive crimson winter-flowering Begonia \(\times\) Mrs. Heal, ohown by Mesara. J. VeItch a sovs. Chelsea, received au Award of Merit. The blooms, chiefly male, mea-ure is to 3 inches in diameter, are chiefly produced from the axils of the leaves. Caryopteris Mastacinthus plants, in well-flowered examples; a new Carnation Mrs. Leo pold Rothachild, of deep rose-colour, and handsome form: Carnation J. Gardiner Muir, of teader He-h-tint (Award of Merit) ; and Begonia aceri folia \(x=\) B. decora of and B. Barietip; a plant with bronzygreen palmate leaves, having pale green veins, and a marginal zone of sivery-flakes, came from the same nurseries.

\section*{Cerrisanthemums}

Which flower in October are b.inning to put in an appear. coce, and the rapidity with which new vari-ises are produced makes the task of selection a somewhat difficult one, as it nearly approsch each other - hy diferent insichuluals ver the Floral Committee on this caccasion. A find and atriking Jellow was thown under the name of John Seward, by Mry closely renemble H. L. Sunderbrach it was thought to so advisable to withhold an award until the two could be shown together. Awards of Merit were made to Mr.C. J. Salter, gr to F. B. HAITFunt, Eur., Woorlbatch. Reigate, for G. H. Hay woo i, a larke broar-peralled creany-white Japas, ese, somen hat incurred, and promingg to make a uneful back-row flower; to Mr. H. SHoesmith, Lurseryman, Wokng, and Mr. H. J.
Joses, fureryman, Lewibham, for Phobus a broad petalled, clear jellow slightly incurved Japanese, of large size. ahown as fine cut booms by the former, and on a plant of rather tall growth by the latter. To Mr. R. Owfy, nurgeryman, fine broad-petalled pure white Jipanese of bigh quality, said to be a seedling from Viscountess Hambleof petal, and for Pomp n Yellow build and masmiveness fiombriated flower, having a very free habit; to Mr. W. Wrmed nurseryman. Farlswood, Redhil. for Roule d'Or 1895. a very fiae iacurved Japanee, the petalshaving a lovely brownish surCace, with a pile yellow reverse, extra fine, raised by Mons E. Calvat; to Messrs. H. Carvelil \& Sons for Prise of Madford, an Ampricin variety with incurved florets, of bright ruhycrimson colour, with a silvery reverse, a large, full nnil striking Iower. An Award of Merit was made to Mr. H. BriscoeJapanese, of his own raising. in the way of Sunflowsr-probally the deepest yel ow of the yellow Japanese yet seen.
Mr. H. J. Jones had a verg fine and effactive group of way of grouping these plants. At the back were somen in the Bamboon, and miugl- pl with the Chrysanthemums were some Palms, Ferns, Dracuenas, \&s, ; in the group were examples of Phobua, Mrs. G. Gover, crimson and salmon; Mrs. R. Jones, White; Mons. Auguste de Lacvivier, pale cerise with yellow Reine a'Angleterre, pink and parple, A. Moulin, white; Meine aldngleterre, pink and parple, aplashed with white; Oeorges Biron, crimson, with amber reverse (Aw; and Mons. Gilt Bankian Melai.) Mr. Jonfs aleo had cut bilverof Japanese Emily Spilsbury, white, in the way of Madomoiselle Thé.e. Rey, which the committee winhed to see gain; A.H. Fewher, an incurved jellow Japanese in the way of W.H. Linc sln-the committee also wished to see this again; Mra, J. B. Taylor, white; Eva Knowles, bright pale orange-cerise, with pale amber rever:e; and M. Yaul adderman to pale bright crimeon, with goldon reverse. In man, a small but very frepefles, Mr. OWh: had Mr. Bachman, a small but very free-flowered Japanese, the colours to be an excellent decorativp variety, but the centre, aaid Wished to see a plant; Lady Ridgeway, a very the compiog flece
the surface pale ceriso, with golden rereres and deep golden contre, bruad-patalled; Calomel Bernard, pale rodish-ernmanon, with amper reverse.
Mr. Wells has a rollection of cut blooms also, inciuding Madame Adrien Armand. a reflezel full flower, the sarface tinted and aported with pale rowe; Mrs. E. S. Traffard, orange and salmon-red rurfacp, and buff rererse; Jambon, red and gold; and Suprome, bright purphish-rose, with sulvery reverse, - broad-patalled flowar.

From Mr. Owen Tenmas, Ruyal Gardens, Frogmore, ame somong thenu Mru. C Harmese varieties, and prominent among them Mra. C. Harman Pagne, Avalanche, Beató Mr. Emprod, gr. to Mre. Wing Fiend, Ampthill House, Ampthill, had a dwarf free-blooming plant of Mry. Anthony Wing field, deop b:ush rellezed fluwers, likely to be ustill as decorative variety.
Frow Mr. C. Penfold. The Gardens, Leigh Park, Hevant, anme Jopanese Mudame lo Capitain, blush, deepening to

\section*{Orchid Oomeartee.}

Present: Harry J. Veitch, Eird., in the chair; and E Hul, Walter Cobr, J. Diaglas, Sidaey Courcaald, D. B C-awahay. H. M. Pullett, Caae. Pilcher, J. Wabriml, Fred. Hardp, E. Ashworth, Thon. Statter, W. Thompson, H. Williame, A. H. Samee, and T. B.
Hismood.

Some groups, embracing many remarkable varieties, were staged. Of the showy Orchids, one of the most beautiful was Cattlega labiata Couksonise, staged by Norman C. Conkson, Esq., Oakwood. Wylam-on-T, ne (gr., Mr. W. Murray). Its pura white, withe true autuma-fiowering labiata form, but which was edged with white. The hand lobs to the labellum remartabledged with white. The handsome flowers bore a Countess of Derby. which to those of the uaique Cattleya clars. The plant was unadimously of tho C. Warscewiczi clars. The plant was unanimously awarded a First class Of the bot
Of the botanical, but still handsome class, a very remarkable and beautiful plant wan Cirrhopetalum Rothschildianum, sent Rothechild's gardens, Tring Park. Tring the Right Hun, Lord Rothachild's gardens, Tring Park, Tring (gr., Mr. E Hun, Lord Whichalso received a First-class Certificate, a rare honour for a meaber of this singular genus. The plant had bluntly angular preudo-bulbs and narrow fleshy leaves, the bulss being bore three large flower, which may not inaptly ina likescence narrow tlowers of Masdevallia Chimanera, the hoodel uppergepal was yellow, streaked with purple, and bearing at its apex an ornate plume of purplecrimsoa colour. The smaller petals were similar to the upper sepal and similarly decorated, and 1 inch across at the upper part, extended somessured over lengit. th, lower part being slender and taillite 6 inches in almost wholly of a rich purple, with a freckling of yellow showing between in places near the column; the hinged lip was purplish-crimson. In colour and form this flower was most remurikable, and very quant when the air atirred the hairs or plumes which decorated the segmenta.
Mr. Davi-) staged a very fine and effective goodford (gr., Mr. Davi-) staged a very fine and effective group. composed chiefly of forms of Cattleya labiata, in the cuntre being a throughout the group of Epidendrum Godseffianum. and Schioderianum, Miltoniz Mo fine Dendrobium Phalæenopsis noble form of \(V\) Sanderiana (Silver Fiora Med

Low's collection other least one very remarkable and beautiful form. viz. \(C\) was at Lowise, a white variety with purple blotch on the lip, which also had a broad, crimpet, white marain-a charmip. which nation. The plant, which was hardly mature for exhibicion received an Award of Mert Also in Messrs. Low's group won, a fine selection of Cypripedium Churlesworthow's group were a fine selection of Cypripedium Charlesworthi, the singular Bulbuphylum mandibu'are,
\& (Silver Banksian Medal).
Messrs Jas Veitch \& Son, Rogal Ryotic Nursery, King's
Road, Chelga, shuwed two varieties of Chen Road, Chels a, shuwed twn varieties of Catt ega \(\times\) Manatini than the other. The largest bore a four-fiowered inflorescence the fluwers much resembling those of a large C. Skinneri, but with a more open lip, and with a alaht yeulow tint suffasing the dark roey-lilec flowers (Award of Merit); Lellio-Cattleyang pretty hybrid; L. C. \(\times\) Fortun* (L. elegans alba (? Schilleriana) §.C Momeise ©, with flowers resembling those of a lerge L.-C. \(X\) Schilleriana, but with the rounder, crimped labellume of Moesise ; sepals, petals, and tube of lip. white tinged with lilac; front of lip purple, with a yellow base to the tube: and Læelio-Cattleya \(\times\) Isis (C. \(\times\) Mastersoniæ of \(\times\) L. pumila , which somewhat resembled a fine form of Læelia pumila prestans.
The fine group for which Messrs. F. SANDER a Co., 8t. Albans, were awarded a Silver Banksian Meral, contained many good things, one of the moat remarlable and pretty being Leho-Cattieya \(\times\) Gottoinas roaea (hyb nat L. tenebrosa \(\times\) C. labiata), and which, while retaining the form of L. tenebrosa, has clear rose fluwers, with light purple veining in the lip (Award of Merit). Also in Messrs. SANDERs group were the pretty Rpi-Lseiia \(\times\) Harcyana (L.ancepm \(\times\) K cilsare) and which was illustrated in the Gardewers' Chronicle,
November 24,1804, p. 629 ; a fine pan of Habearia Sumane,

Mormodes buccinator and M. Rolfeanum, the rare white of s iarlet Sophrontie. Oacitium ornithophyacham nica pans of sallimatem, Millonia. Macidium oraithophyacham O. MarBhallisnum, Milconia Moreliama, abd a number of Variocies of Dendrubium Phalacopses Schroderianum.
Messts. Charleswori
 arranged a very effective group of Orchida, in the centre cf Which was a magaiticent apecinsen of Valla currulea, with Cattloya Bungerothii, varieties of Odontoglossum crimpa Cattleya Gaskelliana delicata, and many Cypripedium Charle worthii, were conspicuous in the group which Charle Silver Banksian Medal.
Measra B.S. Willians \& Son, Victoria and Paradise Nur flower, Upper Holloway. N., had a pretty group of Orchide in fower, remargable fur the presence of three of the Pescatore but which always cause admich are not often seen exbibited, torea Rotzlii alba, five white; P. Khown, viz., Pescawith criazon tips; and \(p\) white; P. Klabochorum, white with criaron tips; and P. Lehmanni, a prand Fiolet and

 cherianm, Williams' var., C. \(\times\) rubrum, \(\because, \times\) vexillarium oup:rbum, some fine Oncidiums, Pleiones, C'attleyas, \&c. (Vote of Thinks).
Cuncan) LuCas, Raq., Warnham Court, Horaham (gr., Mr lescribed in the pretty white-and-purple Sobralia Liadenii of Merit).
W. Thompgon, Esq., Walton Grange, Stone, Staffordshire (gr., Mr. W. Stevens), showed Cattleya labiata, Thompson's varie. y, a large and richly coloured form (Award of Merit). C. labiata cuerulea, in which the whole flower had a tioge of blue hue, the front of the lip being dark, and of a decidedly blue bue (Award of Merit). Vanda Kimballiana, a nob!e plant, with seven apikes, which had been grown for years in the Odontoglossum-house (Cultural Commendation) Cspri pedium Chariesworthii marginatum, with white upper seppihaving a base and margin of rose (Award of Merit); and cut epites of Miltonia Schroderiana, Odontoglo:suma, \&e. A. J. Hoblamton, Erq., Forty Hill, Enfield (gr, Mr philippinerse), a noble flomer \(\times\) Alfred Hollington (ciliolare \(\times\) philippinerse), a noble flower of the C. seligerum clasa, but
more massive, and superior to any in its section (Award of more mastive, and superior to any in ita section (Awar
Mrrit); and C. \(\times\) Evenor (concolor Kegnierii \(\times\) Argus). Thos. A'tatrer, E-g, Stand Hall, Whitefield, Manchester (gr, Mr. R. Johuson), staged a fine plant of Letio-Cattleya \(x\) Catlleya, a varea, and Closely resembling L.-C eximia; margined with rose; Cattleya \(\times\) Lord Ruthschild, and \(C\). bicolor ccerulea.
De B. Crawshay, Esq., Rosefield, Sevenoaks (gro, Mr. S. Cooke). showed Vanda Kimballiana, Ntudd's varioty, a very large and good form.
Mur Fredrriok Wigan, Clare Lawn, East Sheen (grower,

M. A. A. Peeterars, of uorecorded parsels, sent Cypripedium \(\times\) Francois Cbas. Richman; and the curiously-flaked Cattleya labiata Peetersii.
Walter Cobb, Esq., Dulcote, Tuobridge Wells (gra, Mr hybrid between M. candida ant M. cuneata, apposed nataral segments. barren with brown, and slightly concave white with purple dise (Award of Merit).
G Marshall. E-q, Claremint House, Grimsby (gr., Mr. Johnson), sent ont examples of Vanda Kimballiana alba, and other species.
Mr P. MCirthur, Maida Vale, staged a group of Orchids, comprising Cattleyay, Cypripediumes, Maxillaria grandifiora, Dendrohiu \(n\) Ph arenopsig, D. formosum, \&c (Vote of Tha ke), F. W. Moore, Esq., Koyal Botauic Gardens, Glasnevin, trepia maculata. Sir WM. Marriott dinctiorum and ResI ro, sent Cypripedium \(\times\) Marriott, Down House, Blandhybrid, with white fluwers, slightly spotted with parple, and somewhat res mbling C. \(\times\) microchilum.
Cattoy. Hakdy Eeq., Tyutesfield. A ihton-on-Marsey, showed Cattleya B,wringiana, Hardy's var., a large and richlycoloured form. J. F. Ebner. Woodlanda, Beckenham (gr., Mr. A. Walte), sent two hybrid Cypripediums.
Mr. Paterson), eat Oncidium Park, near Beckenham (gr. hybrid Miltonia, de. A. SHiPLEX, Eq., Elimiond, Westhary-on-Trym, Briatol, eve A. SHiPLEX, Eq. Eleafiend, We

\section*{Fruit Committeo.}

Preant: Philip Crowley, Eoq. (Chairman); and Menirs. R Pbert Hogr, Geo, Bunazrd, W. Wiks, T. T. Waltmareh, J. Wright, Alex. Dean, W. Farr, Geo. W. Q. Lane, J. Samese, Jamee Hudion, Geo. Raynold Divers.
From the Royal Gardens, Frowmore, gr., Mr. O. Thomas, Wraite were of medium size, bighly Frogmore Dessert. The identical with the Slow Apple. coloured on one aide, and another dish of Applen, named Princess, a yellow fruit streaked with red.
Mr. W. J. Empson, gr. to Mps. Wivafikld, Ampthild, Variety, called Red Streak Beauty.

Another Apple, called Stabbis Seedling or Winter Quarenden, was shown in quantity by M. W. Pslmer, Cobden Villas, Andover. The fruits are very highly coloured, in shape lik Quarrenden, but rather larger. Some of the beat fruits dire quarrenden, but rather larger. to ascertain their keeping qualities.

Mr. E.C.Banks, Waterville, Nova Scotia, sent some fruite of an Apple which he called Banks", or Red Gravenstein, also some fruits of Gravenstein, for comparison.
Messrs. Paul \& Son, Cheshant, sent fruits of a large kitchen Apple, named Captain Sanders, which the committee desired to see again in the spring.
Still another new Apple, Lindura Pippin, was exhibited by Still another new Apple, Burs, Eqq., Leighton Buzard; the fruits are of F. Welis, Eeq., Leighton in colour, and but little like a moderate size, quin in appearance.
An extraordinary coloured fruit of Bienhein Orange An extraordinary coloured iruit of Beenkei, 8, Dudley Villas, Portswood Road, Southampion (Vote of Thanirs); and Mr. E. Hill, gr. to Lord Rothschild, Tring Park, exace some of the largest fruits of Doyenné du Comice Pear Com seen. They were grown on an outside wall (Cultural Commendation)
Mr. WILL TAYLOR again exhibited bunches of the hardy Grape, Reine Olga de Würtemburg; and from the Royal Eorticultural Society's Garden at Chiswick came ripe banche f the hardy Grapes Chasselas Rose, Chaseelas Noir, and Gamay Noir; the two last-named, but especially Gamay Noir give the best results in the open-air vineyards belonging to the Marquis of Bate at Cardiff. Another Grape, named Black Monulka, was also sent from Chiswick. The bunch was Monulta, was and thin, and the berries hf acorn shape, and rather long and thin, with litle flavour, but juicy and aweet, evidently from indoor culture.
Mr.W.J. EMPSON exhibited a rather indifferent bunch of Mr. Wrape Mra. Wingfield the berries are black and rathe the Grape Mrs. Wingfieli, those of Madresfield Court. The long in shape, a little Jire those of Marresfel
The white Grape Marchioness of Downshire was exhibited The white Grape Marchioness of Downshire was ez
by Mr. T. Bransiaw, Hirsborough Maston Hall, Guisborough, Yorkshire, exhibited four fruits of a new Pear, namod Charles Ernest. The fruits are large, not unlike those of Pitmaston Duchess in shape, yellow with ieolated flushes and tripes of red.
Mr. H. Deverilla, Haubury, exhibited very large bulbs of his Ailaz Craig Onion, and the flatter-shaped Anglo-Spanish variety.
Mears. DOBBIE \& Co., Rothesay, had good Leekn and excellent Curled Pareley, known as DJbbie's Selected (Siver Banktian Medal).
Mrs. Jones, Greenford Place, Sudbury, Harrow (gr., Mr. Jones), erhibited excellent Leeks, Ayton Castle Giant, Cham Jones), eze Lyon, and Sutton's Prizetaker (Cultural Compion, The
Melon Earl's Favourite was again exhibite 1 by Mr. WARD of Longfond Castle Gardens, who had sir fine fiuitg (Vote of Thanks).

Seedling Me'ons included one called Anthony's Favourite, shown by Mr. W. J. EMPSON. The committee asked to see further fruits of the variety.
R. Buraell, Esq, Bury St. Edmund'd (gr., Mr. Bishop), showed two red-flesh Melons, named reaptctively, R.H.S, and We,tley Hall.
Mr. Geo. Wythes, gr. to Earl Pfrrcy, Syon House, Brentford, exhibited two small apricot-coloured fruits of Melon Beauty of Spon.

Applea and Pears were exhibited in large quantities. Mesern. Piul \& Son, The Old Nurserie*, Cheshunt, had a collection of deasert Apples in about fifty dishes. Gascoyne's Gcarlet, King of the Pippins, Jonathan, Mabbott's Pearmain, Golden Reinette, Blenheim Orange, Cheshunt Pippin, Fearn's Pippin, and Adams' Pearmain we colour (Silver Banksian Medal)
Mosrs. T. BIVERS \& SON, Sawbridgeworth, exhibited a collection of Apples and Pears of remarkable quality, and the varieties were selected from the very beat: Washington, Court Pendu Plat, Belle Dubois, Wadhurst Pippin, Bismarck, King of Tomkins County, Peasgood's Nonsuch, and Coz's Orange Pippin (the last-named variety being shown as large as Bleaheim Orange is usually seen), were all superb, Among Pearr, prominence was given to Conference (Rivers), Pit maston Duchess, Magnate, Gemaral Todioben, and Doyenné du Comice (silver-gilt Knightian Medal).
Messra. T. Rivers \& Son, Sawbridgeworth, exhibtted fraits of a new large purple Plum, Rivers President. It was recom mended an Award of Merit on account of the fruita baing so late. This much has already been proved.
Messrs. Jas. Veitci \& Sows, Royal Exotic Nurseries, King' Road, Chelsea, brought a collection of Apples in a hundred varieties, all of them different from the hundred kinds staged by the firm at the recent show at the Palace. Among Apples we noticed Lady Suffield, Braddick's Nonpareil, Rymer, Wy ken Pippin, Bess Pool, Northern Creening, Betty Geeson, Woldan Pippin, the Old Ringer, and other less known sorts Goldan Pippin, the Old
(Gilver Knightian Medal).
The only collection of fruit from an Amateur was one of Apples and Pears, Irom the Dowager Lady PREAKE, Fulwell Furk, Twickenham (gr., Mr. Richwood), who had about forty Wishee of Apples, and thirty of Pears. Many varieties of each Were showa in sood condition (Silver Banlsian Medal).
Aleabembles wore capitally blows by H. H. GLBBS, Raq. bitorman House, Thotree ( Gr ., Mr, R. Meckett). This exhibitor had very large and excellent oollection. The back-fell-Protectiog), Cavififor, Artichokes, Broceoli (Veitch's Kale, Sco ; and Chere wers (Veitch" Autumn Giant), Kale, ke.; and there were very fine rocts. Parsnipe,

Sutton's Student, Carrots Long Red Surrey, Veitch's Match less'Scarlet, and Sutton's New Intermediate, were all capital. Loeks, Sutton's Prizetaker and The Lyon were large and very good. Celery, Standard Bearer, Sutton's Solid White, and Catbush's Red. Onions were wonderfuly large and heavy; the varietiea were Ailsa Craig, Sutton's Al, Coct ez nut, and Sutton's Exhibition. The varieties of Crimson. hibited were Pragnell Exhibition and Dell's Crimson. Turnips, Veitch's Red Globe, Green-top, Stone. Potatos, Magnum Bonum and Snowdrup. Bean (Runner), Ne Plus Ultra and Jubilee. Then there were Brussels Sprouts, Salsafy, Stachys tuberifera (Chinese Artichoke), Capsicums, Tomatos Cabbage, Colewort, French Beans, Peas, Mushrooms, Maize, Marrows, \&c. (Special Cultural Commendation and Silver-Gilt Knightian Medal).
Knightian Medal).
A fine collection of Celery was exhibited by Mr. W. H. Divers, gr, to the Duke of Rurlind, Belvoir Castle Gardens, Divers, gr, to the Duke of Gem, Sandringham Dwarf White Grantham. Sutton's White Gem, Sandringham Dwarl White, Incomparable Dwarf White (Veitch), Wright's Solid White, (Veitch), Cole's Crystal White (Veitch), Sutton's W. DIVERs and Belvoir Castle White, raised by being similar in The last-named is described as being similar in quality to the Major Clark from which it was raised. Nearly a score of red and pink varieties were shown, and among them was included a rather large variety named Man of Kent (to be tried at Chiswick), raised by Mr. Divers, and deacribed by him as remarkable for standing longer than other kinls before run ning to seed (Silver Banksian Medal).
Mr. H, A. Orr, Bedford, exhibited his patent storing-tray for fruit, noticed at the Crystal Palace. High Commendation and a Silver Banksian Medal were extended by the committee to this useful contrivance.

\section*{Lecture on Nut Culture.}

In the afternoon a lecture on Nut culture in England was given by Mr. Jo. Omer Cooper, The lecturer explained the botanical affinitien of the Hazel the various uses to which the wood has been put, and then gave some information reapecting the caltare of Filberta in the district of Maidatone. Mr. Cooper's Filberta in the district of Maid Filberts.

\section*{NATIONAL CHRYSANTHEMUM.}

October 8.- A considerable number of new varieties of Japanfae Chryanthemam came before the Fioral Committee on the above date, and Firstclass Certificates of Merit were awarded to the following: - Mons. Auguate de Lacvivier, pale reddith-cerise, with yellow reverse-a larige, foll, broad-petalled variety, of great promise (H.J Junes) This variaty was also finely shown by Mesary. J. Veitch \& Sons, in their groap of plants. To Phoobus, a large deep yellow Japanese, likely to rake a very usefal exhibition variety (H. Shoesmith). To Boule d'Or 95 (E. Calvat), a very fine amber-coloured incurved Japaneap, in the way of Loaite in reference to its baild (W. Wells). To Lady Eather Smitb, a magnificent broad-petalled white variety, a seedling from Viscountens Hambleton; and Pompon Little Gem, a mall and finelyformed bright yellow variety, very free (both from Mr. R. O wen). To Mone. C. Molin (W. J. Godfrey) ; and to an early-flowering Japaneee, Madame Marie Mane, previoualy demcribed, a mont useful decorative variety, beiag remarkably free.

\section*{NEW InVENTIONS.}

\section*{A SAFETY LAMP}

The question of the aafety of paraffia lamps is one of grat intereat, affecting rich and poor alike. Far too frequently we read of lamp explosions, and many timen the recessity of leginlation in the matter has been urged. But with the Kienow Safety Lamp (one of which we have received for notice) explonion is imponible. And considering that one of the largest insurance companies hat taken the riak of issuing an insurance policy againat fire with every lamp olld, they at leat must believe in the claims of the inventor and manufactarer. The remervoir being made of metal, it is unbreakable in the ordinary eense of the word. The patent conaists of a tabe made in the shape of the letter \(\mathbf{S}\), through which the wick panser, and should the lamp be upset or dropped, one half of the S-like tube fills with air and prevente the oil excaping. An excellent gardener's lamp for use in his lantern when examining the thermometers in the houses and atoking the boiler-fires at night, the light being far more brilliant than that of a candle; and should the lamp be knocked over, nothing worne than a amoky chimney can happen. The renorvoir is of about the ize of a

Peasgood' Nonuch Apple; and the total height, inclading the chimney, about 9 incher. The maken are Mearra. Kienow \& Co., 25, Fore Street Arenep, Londod, E.C.

\section*{Bbituary.}
J. Crispin, F.RH.S.-We regret to anooares the death of Mr. Jamen Criapin, F.R.H.S., tho head of the firm of Jame Crispin \& Soms, Horticaltaral Engineers, of Nelson Street, Brintol, who, after a prolonged illnesa, at fifty-five years of age, pues. away at his residenc?, Chester Park, Fuhponde, on the 14 th int. Mr. Criapin was born as Molla, mete Frome. A skilled horticaltaral engineer, krymel his buminess operations over a very large meen wher his knowledge and experience were readily wmited, and alwaya appreciated. He was one of the mans succesafal growers of Oichids in the kingiom, and only recently, it will be remembered, he had a my. nificent show of these mach-prized flowern at the ahowrooms of the firm in Nelson Street. His wo lection at his residence, Chenter Park, wu will known, and attracted many amateura from all pun of the Weat of Eagland. He many times moa 1et prize for these Orchide at flower inom, an twice he was awarded the Bankian Medal of tho Royal Horticaltural Society.

\section*{Variorum.}

Engligh Wheat and a National loaf.In reference to the idea recontly suggented tbat, in order to revive the Wheat-growing indutry in this country, we should have a " national loaf," that is a loaf made excluaively of Eoglish Whent, and nold at a penay a quartern more than other bread, the Field eays the aggestion is "groteaque, and can only delay attention to matters which might bo helpfal to Wheat growers. If Eoglith Wheat-loaves were firat quality we might see a apecial market eatablished for them. Engliah Wheat doen not make the beat flour. It is not a good absorbent at dough making. It does not give a large yield of bread. It looks very white as flour, but gives a less attractive looking losf. It is a sweet, soft bread, apecially fitted for cakes and biacaits. In gluten Engliah Wheat is by no mean ricb. The bent bread is that which is made from a mixture of Eaglish and foreign Wheat, and any attempt to parvey a loaf as English, Ratsian, Indian, or American wuuld be a step in a retrograde direction.

\section*{ENQUIRY}

\section*{He that questioneth much shall Learn mueh "-Bicom}

Fruit Fabming. etc, in South Africa.-A correspondent, "H. R. ' T ," is desirous of looting up the question of fruit farming and cognate enterprises in South Africa, and would be glad if some of our readers having accquintance with that colony would kindly furnish him with reliable data. He has heard that a company has been formed "to found fresh fruit farms," called the Cape Oichard Company. He also requirea the address of an agency in this country for the sale of Cape products. If our correspondent mean fruit product from the New Company' Orchards, nome jeara must neceanarily elapse before he may require an agent for the ale of the fruit therefrom.

- Owing to the large increase in our circulation, we are under the nocasslty of going to press some hours earlier. Our constributors wiil kindly aid us by sending their communioations as early in the woserk as poosibles Communications should rench
Belladonma Lilies and Vallotas: W. S. When purchaniog the bulbs of the Belledonna Lily in Auguat and September, the flower-spike should be prominent. They will expand perfectly if they are potted in any kind of moist material, although if they are to be kept for the purpose of planting out on \& warm border close to a wall where the young brood will bloom beantifully if left for years undisturbed, and merely protected by a covering of leave:, or by having a handlight put over the clump, they thould be potted in rich eandy losm, three bulbe in an 8 or 10 inch pot, with the swelling part of the balon just beneath the surface of the mould. If you do not ask for bulbe showing for flower, the dealer, thinking it doen not matter, will sell to you balbs probably not likely to flower. See also p. 454 in this isucue The Vallots is usually bought in the autumn months and potted up, four or five balbs in an 8 -inch pot, and grown on for flowering the following anmmer and autumn, it being necessary in thin case that it should be well eutablished before flowering; in fact, it resents root dietarbance, and the potfuls of bulbs are bent when merely topdrened in the epring, or repotted bodily when this bas become necessary by the crowded atate of the belts.
Booss: A. B. C. The Garden Annual. 37. Southampton Sireet, Covent Garden, W.C. Chrysamthemums and their Culture, 171, Floet Street, EC. and of the author, Mr. Molyneax, S wanmore Park Gardens, Biehops Waltham.
Errata: Top line of col. 3, p. 399, scale on Carrote ahould be scab.-Mr. Charles Slocombe. We were in error in apposing Mr. Charle Slocombe, whote death wo recently annoanced, to bave been the artist who occasionally contributed illustrations
to the Gardeners' Magazinc. These are the work of Mr. Alfred Slocombe, who in atill happily among 73.
Flax Culture: Enquirer. It is atill caltivated in lreland for manalacturing parpones, bat in not such large quantities as formerly, although the maritime climate of that conntry io well adapted to the needs of the plant. But, as in many other production which we are an well able to raise as the foreigner, we go abroad for the greater part of our suppliew, and the farmer wrings his hands and laments his lact of pence.
Hows in Peach Walls: F. Mouland. Portland cement is a good material for topping the nailholes; and to give a uniform appearance to the face of the wall it may be coated with a thin coating of coment, which may be put on with a whitewash brash, or, if freed from all grit, with the garden engine.
Issects: A. Laker. We do not recognise the caterpillar; try and breed the moth. Thorough fumigation two or three times repeated, might be efficacious. - Armitage Bros. The grubs were thone of Dipteroun insects, apparently of two kinds, bat it is not possible to state the apecies with certainty. The earth should be treated with some insecticide. R. McL.

Likak in Pipm: Vindex. Cat out the packing of cement, and make a new joint with molten lead, or iron-filinge and tal-ammoniac.
Manuschipt for Publication: A. B. C. We cannot pabliah any communication froma anknown correspondent unless it be accompanied with foll name and address; not necesarily for anpending to the article, but as an earnest of bona fides.
*. Plarts, Fruits, exo. to bie Nained.-The applications to name fowers, and especially fruit, are so numerous at this season as suverely to tax our resources. They entaul readers have no idea. We are always willing to oblige our readers have no idea. We are always willing to obige our Chronicle is our business, to which everything else must give woay. Correspondents ars respsetfuly requested to observe the sule that not more than six specimens can be dealt woith at a time. If more are sent, it woor d be a graceful act on the part of the sender, to sind also a small contribuision to the Gardeners Opphan fiond. Correspondente sending plants or fruits to be named, or asking questions demanding time and research for their solution, must not expects to obtain an answoer to their onquiriss the the current week. Specimens should be good ones, aies carnot as a rule be named

Mag., t. 296) var. variegatum; 2, Diplacu glatinosut; 3, Fachaia procumbens; 4 , Selaginella viticulons: 5, Ealalia japonica variegata; 6. Agathea coolentis.- \(J . R\). 1, Cattleya Walkerianà 2, Oncidium apilopterum; 3, Oncidiam divaricatum.
Prar: Mells Rectory. A seedling probably of nome garden variety of Pear. Can you send aome fruita when ripe?

Potatos Serding: E. H. O. Many varietier do not bear flowers, or they rarely do so, and thone which flower do not always "set" the flower". Caltivation has a tendency to suppress the flowers, and prevent their fertilisation! and the longer any variety has been in cultivation, the fower the blossome, or none at all. In the Ashleaf varieties, the ability to flower neem: to be quite lout.
Rock Plants: W. T. H. Omphalodes Laciliz, Globularias, and Campanula Zoysii and C. Waldsteiniana, by division; Edrianthi by seeds.
Rose Difficult to Staike: Miss Armstrong. The specien is Rona Branonis. The striking of cattinge would be aucceasfal if half-ripened ahoota with a heel were taken in July, and strack in a close frame or hand-light, on bottom-hest of \(75^{\circ}\) to \(80^{\circ}\). The leafleta ahould have the central one cut off, and the leaf at the base, if any, hould remain on the cutting. Pat one catting in the middle of a ch or 3 inch pot, in sandy loam, presed firmly, and then well water the cattings. No more water is likely to be needed if the frame be well shaded during the anny hours before rooting has taken place. Take out all pata containing rooted cattings, and place in a leat close frame, gradually inuring them to full exposure. The above method is applicable to all Rose difficult to root as cuttings. Less troublesome methods are, to layer either the tips of the shoots-as the firat foot of growth, or lay whole ahoote on the soil, pegging them down at intervals of a foot, and patting a little soil over them, at the point where the peg. are inserted. Maréchal Niel Rose can be readily increased by this method. It takes a whole neason.

Staphylea prnnata: W. D. H. It in called Job'e Tearn, Bladder Nat, and St. Anthony's Nat. Loudon, quoting Haller, remarks in Arboretum et Fruticetum Britannicum, "that the kernela tante like those of Pistacia, and are eaten in Germany by children, and this appeara to have been formerly the cave in England, for Gerard asya tbe kernels, though sweet at first, are succ jeded by a nauseons tante, and finally they act an an emetic." The flowerm contain mach honey, and are much visited by been. The plant is a native of Earope, and is not indigenous in this country, but it is now common.
Walnuts to Kegp Fresh for Four Montes: F. M. C. Oily seeds anch as thene cannot be kept in a good condition for eating, unless the air be kept from them, the moisture contained in the nut soon evaporating, and the oily constituent of the kernel becoming rancid. Choose a box or barrel of a size saitable to the quantity of nuta to be stored, and having at hand nome not very dry and or charcoal-dast, proceed to lay them in the receptacle in alternate layer of and, \&ce, and atore in a cool place.

Commulications Received.-W. M.-A. H.-R. Y.-J.C.s.

 -W. K. J. A, - B, (your communication han beon for whrded to the secretary of the Boyal Eorticultural society).

\section*{SACRED FLOWERS.}

THE following " Rough Notes on some of the Sacred Flowers of the Hindus" are contributed by Yogendracri Ghoss, to a recent namber of the Proceedings of the Agricultural and Horticultural Society of India:-Flowers have been associated more or less with religious festivities of every nation and in every time. Garlands and wreaths of flowers appear in the Old Testament, as well as in the Zend Acest of the Fire-worshipper. With the ancient Greeks and Romans, flowers were a no less favourite adjunct to their oeremonies, religious, political, and social: a Palm and a Laurel were emblems much coveted. In India, however, flowers have attained an importance unprecedented in the annals of other nations. No religious or social ceremony of the Hindus is complete without flowers. In an assembly, the respeoted is decorated with garlands, and at times there is much heart-burning as to who shall get the first garland. In a party the invited have their share of nosegays as well as of pan and attar. The marriage ceremony is completed by the exchange of garlands between the bride and the bridegroom. The corpse is bedecked with garlands befoie it is placed on the funeral pile.

Naturally, therefore, the Castras toem with directions as to the kinds of flowers to be usod on partioular ocoasions, as to the time of collecting them, as to how to collect, and who shall colleot, and as to the time a particular flower is fit for offering before it becones stale.

In festivities and ceremonies conneoted with the manes of the ancestors, white flowers, and garlands made of white flowers only, are used. In nuptial ceremonies red, jellow, and white are allowable. In ceremonies connected with the worship and festivities of the goddesses of female energy, red flowers are preferred. But, in the following flowers the colvur is of no consequence, viz; Karabira (Nerium odoratum), Padma (Nelumbium speciosum), and Roses. The Padma or the Saored Lotus is ponsidered the prince of flowers, and the prohibition as to Cadra (Shudra) does not apply to this. Padma and some other flowers, such as Michelia Champaca, where the work of collecting is arduous, a Cidra (Shudra) may be permitted to bring them for the use of a person of the twice-born race.

So far back as Mana, the Brīhmana himself is directed to collect his own Kuça (Poa cynosuroides) flowers, Samid, i.e., faggots and water; those callected or brought by persons of the Cadra class, being pollated by their touch, are not fit for use. A Brăbmana should never beg flowers, but he can take them from anywbere without the parmission of their owner, for the
act is not a theft. A Brāhmana must not buy flowers, but he may do so if he pays a heroic price for the same. Flowers should not be collected in the afternoon nor after the midday bath. Flowers growing on trees in a temple, or near a burning-ground, or on a polluted land, are unfit for the parposes of offerings. Stale flowers are unfit for offering. Certain flowers beoome stale sooner than others. Stale flowers, -flowers not fresh-looking, and flowers dried or withered-should never be used. In col leoting flowers one should not denude the plant of every blossom, and the picking of buad which may not open the following morning is forbidden.
The use of flowers, or leaves and twigs, in religious ceremonier, though originating in the Vedas, became general in the later Pa ásas. In the Vedas, the Samid (faggots), or rather twigs, with mall leaflets for feeding the fire with, were mach valued. The Soma, however, which was equeezed for its juice to mix with fermented barley gruel, superneded all. Bat what thin Soma was it in rather difficult at this distant age to ancertain; more so when the Vedic Yäzas and observances have all been forgotten. The Soma was a rare commodity even in the days of the Vedas, and it used to be brought from distant countries on the backs of goats through tracts uninhabited, and infested by wild beasta and robberw. It uted to be bartered for cows. The Mpjavat Hill is said to be ita native land ; but where is this Parvat \& Scarcity of the true Soma was perceived in the later Vedas, for ita substitute, the Patika is mentioned in the later Bláhmanas. This Pūtilea again has now become protty acarce, and there are few experts in the Yajoas who can recognise it and know its habiteto. The aubstitute Soma hat been identified by the onrly Anglo-Indian botanista with the Sarcoatemma brevistigma. It is an almost leaflest twining plant which exudes a milky juice, and it grows in dry and arid soil. With the kind assistance of His Highness Prince Rā山à Varmà of Travancore, a few living specimens of the ame were obtained, bat the plante being impatient of damp, almont all died; the few which aurvived are now thriving and bearing flowers in the dry climate of Vindhy àzal, in Mirzapar, North-weatern provincee. A elitary epecimen, reared in a hanging pot, is growing with some laxuriance, but it has never been seen to bear flowera bere in the moist atmoaphere of Calcatta.

The Palaça (Batea frondona), it a Samid or faggot of Vedic antiquity. It origin is dencribed in a legendary anecdote occurring in one of the Buáhmanas of the Veda, and it is said to have been born of Nectar. With this tree in anocisted in the Vedas the Khadia (Acacia Catecha), but they are both uned an Samid or faggots dipped in ghi and thrown on the fire jast to feed on the eame. The Some and the sacred Grats Kuçs predominate in the Vedar.

Although the Soma has been forgotten and lost sight of, the Kuça Grass still retains its importance. No ceremony can be performed without this graas or any of its sabatitutes; for, ander the rales, a mat made of this grass is apocially consideted a manetified carpet, and though it may be dispensed with in certain ceremonie by asing woollen carpets, the ring which has to be borne on both the ring fingera made of two blades of Kaçs Grass, is an indispen. asble adjunct of every ceremony. A bundle of Kaça is equally indiapensable, for it has to be held in the left band while the ceremony continues. Three blades of the Kaça Grasa tied together with a peculiar knot make up the Pavitri, the purifier, with which every sacrificial object being aprinkled is parified.
The ternate-leaved Palācs in the later perioda hav, howover, been subatituted by the Vilva (Egle
Marmelon), which pater Marmelon), which has aleo ternate foliageo Pauzăaic Vilva is asaid to aimilar origin to the Vilva. The bence the Vilve is often atyled of Nectar (Amrita),
i.e., born of Nectar (Amrita), which was charned out of the ocean by the joint labourn of the goda and the demons, who, in so doing, uned the serpent-god Cesa as the charning-rope, and the Mount Meru as the churning-staff.

\section*{New or Noteworthy Plants.}

MASDEVALLIA FORGETIANA, Krnzlo, \(u_{0} s p_{0}{ }^{*}\) A NEW pecies of Masdevallia from Northern Brazil, the home of the old Masdevallia infracta, Lindl., one of the veterans of the genus. The leaves are comparatively narrow, gloasy, bright green, paler below, blunt or rounded at the apex, and a little thorter than the alender wharply three-angled flowerstalk. About the latter, I am not aure if it bs one-flowered or few-flowered ; the specimen at band is one-flowered, but it seems to me that there have been several floweru. The cup or calyx of the sepals is very short, omewhat compreased, with a deep impression below, forming a rectangular chin at the very base of the cap; the free portion of the eepals is very short, the lateral ones especially being united, the top excepted; the taila are about 25 3 cm. long, the dorsal one being a little longer than the lateral. The colour of the sepal-cap is very tender tint-apricot outside, \&c., and a little more intense on the invide. The petals and the colamn are very insignificant, and jast as in many other Masdevallias; the lip, though very small, need some remarks. It is linear, with a blant, triangular, thickened, and somewhat warty apex; in the middle there are on each side two small lobes, and two small elevations or calli on the disc. The plant is, perhapa, not a first-rate beauty, lise many other Masdevallias, but it is nevertheless a nice little plant, and intereating an a Madevallia, coming from Brazil, a country not nearly so rich as the Andes of Peru and Ecuador. Is is, of course a genaine tropical Orchid, and requires warmer treatment than the alpine Masdevalliav. By apecial request of Menarn. F. Sander \& Co., who first flowered the plant, it is named after the collector, Mr, Forget. F. Kränzlin.

\section*{Anectochilus Sarderianus, M. \(s p\). (?).}

To establish a new apecier, flowers are, of curse, atrictly neceasary, especially in Orchida, and nobody is able to dencribe a new Odontoglonum or Dendrobium when ouly leaves or tulb are at hand. Bat among the terreatrial Orchid of the Sanda Islands the little groap of Acoctochilus and allied genera show so peculiar a character in the leaven, that we can anume a apecies to be new if the leaves that we receive how differences from thone of other plant of the same genus. The two leaves I received from Mr. F. Sander belong undoubtedly to a new Ancoctochilas, and are the most brilliant Orchid-leaven I have seen. Imagine two opponite, broad, oblong leaves, blunt at the top, with a alightly waved border, dark green and velvety on the upper nide, with a network of greenish-golden veine as in Ancetochilus setaceus, the underside pale flesh-coloured, with whitish veins. In vize the leal greatly marpasien the dimenaions of other known apecies of Ancectochilus, being nearly 11 cm . long (about 4 inchea) and 6 cm , broad ( 2 z inches)-dimension never reached by other Ancectochilas, and rarely by the beantifal Dosuinia marmorats, which entirely differs in the
* Masdeallia Forgetiana, Krnzl., n. sp. - Foliis oblongolanceolatis obtusis in petiolum sensim angustatis laete viridibus nitidis crasse coriaceis ad 12 cm . longis ad 2 cm . latis; scapo longiore 15 cm . alto, triquetro subtorto monantho? floribus saccedaneis? bractea scariosa longa pedicellum longum ( 3 cm ) dimidium usque vestiente, ovario-brevi; cyath) floris brevi campanulato infra mentum rectangulum formante parto libera mepali dorsalis brevi triangula in caudam teretem 3 cm . longam protracta ; sepalis lateralibus multo majoribus semiorbicularibuas fere ompano conatis parte libera brevissima in caudas 25 cm . longas protracta, toto eyatho pallide persicino intus roeeo-adsperso caudis intensioribus; petalis linearibus subfalcatis incurvis apice brevi-triangulis apiculo increassato. labello requilongo lineari medio utrinque lobulato, apice reflexo triangulo apiculato carnoso tubarculoso sequilongo, generis. - Northern Brazil, leg. form and position of the leaver, and the two learen that I recerved were by no mean the bigget. I it a new apeciep, or only a giant form of Avcesto chilus setacens? Qui viura verra. To conclude, by analogy, I incline to regard the plant as being a the apecies, and I have therefore given it provinionaly name, Fr. Kränzlin.

\section*{AN ENGLISH ASTER FIELD}

Asters are at once amongat the mont bearatill easy cultivated, and popular of our halfohed annuals, and, in fact, they deserva more an bestowed apon them than they anally got th seeds which we purchase are montly raind in Germany, where the weather in the antur, il a rule, is more favourable for seed-warist the in this coantry. While on the Continent lape breadthe of land are devoted to their editan he seeding purposes, it has not been the catom to mon other than the "Globe" or "Qailled". riwin in this country with the same end in vien, Hemm H. Cannell \& Sons, at Egnaford, have made axperi menta in thi direction of late jearr, and Mewn Dubbie \& Co., Rothesay, imilar ones elaewhera vith reaulte which have jatified the latter firm in makim a more extended trial in their new grounds a Oipington, in Kent. The illustration here gira (tig. 83, p. 485 ) is of a corner of Meism, Dobbity Aster field, in which were cultivated the Quilla, Victoria, Pæony-flowered, Cornet, Dwarf Carjurs themam-flowered, and other varieties, to the number of close on 30,000 plants. The neede were some in March, the eeedlugge pricked ont in the unal wh, and placed in the quarters early in Jane-somentif later than uaual on account of the drought, from which, indeed, they affered aeverely at a later stife. The remarkably fine autumn made up for there and other ahortcomings, and we are informed that this year's experiment hav been a decided succen, and auch as to lead Measrr. Dobbie to believe that in the cananty of Kent, seed of Aster, of the flat petaled varieties, may be asved to advantage in an antuma of the ordinary character. Other pointa being equal, we should prefer home-grovin seeds to any othest,

\section*{KEW NOTES.}

Aristolochia clypeata. - We have at last as ceeded in inducing this npecies to develop ita hat aome flowers, alter having been unfortanate far three years. Hitherto, the fogs of October him caused the buds-of which plenty always formed a the old stems in September-to fall before ayy them opened. At the present time two planta maj wow aeen in flower, one in the Water-Lily-house, bersis about a dozen bloom ; and the other in the \(T\)-ragen There is a figure, with deacription of this apecies, in Gardoners' Chronicle, 1092, xi., pp. 433 and 435 . which represents the flower now at Kew, ixcep that the latter are larger and more delicung reticulated, whilet the leaves are maller. Thoy have no perceptible odoar, and are in wizi 6 incur by 7 inches, coloured inside of a rich velvety - whith, brown, beantifully chequered with creamy - wram with a blotch of bronzy-parple above the en as to the tabe. The plant ought to find favour autumn-flowering stove-climber. It is quatiti ferent from the now popular A. gigas Starte being both in leaf-characters and habit, the leaves dry and ovate acuminate, slightly peltate, of rather andar papery textare, with rough venation on the from aide, whilst the flowers are alway deang hooth the old corkj-atems, and not from yo hare botil The Kew plante were received for, and home has grown in A. gigantea, a opecien with ay larget similar leaves and flowers, but the latter mbis (Nor A. clypeate wat discovered in Colombist it to Grenada), by the collector Walli, who sent alomed M. Linden in 1868. There is good colaur figure of it in L'Illustration Hortioole, 1870, pl. 40:

\section*{Albbrta magna.}

This plant was introduced from Natal in 1891 , and flowered for the firnt time at Kow in Oitober leal
year. It is now in flower again in the Cape-house, and will probably contivue in bloom for some time yet. The habit of the plant is that of an erect, sturdy, freely-branched shrab, with orate glosiy green leares, and terminal paniclen of narrow tabolar flowert, an inch long, and coloured of a bright crimson, saggerting, in the effect they produce, those of Eabothriom coccineum. It is a promising plant for the ccol conservatory, and may evea prove hardy in the warmer part of these islands. There is a second attraction in the bright red colour of the leaf like calya lobes, which develop
the form of stars, their colour being cream- yellow, dotted with brown, and the whole surface covered with long eft white silk-like hairs, the attraction of the apecimen fiere deacrified will not be doubted, not mentioning the disagreeable odour which excitea much cariosity among visitora until its source is discovered. This Stapelia thriven only when grown in a hot moist stove-in fact, the Kew plants are grown along with Dendrobium Phalronopais. Posibly many other apecies of Stapelia, which are generally difficult to manage, or, at any rate, to flower in a dry accalent hoane, woald grow better and flower with
are borne on a crowded, branched panicle, which ie partly enclosed in a large bost-shaped epatbe 18 inches long, apringing from the axiln of the oldent leaf. A figure of it has been prepared for the Botanical Masazine.

\section*{Crcnocars Haager}

Thi diatinct species firt flowered at Kew exactly three year ago, a year after it had been received from Mr. E. Kand, of Para, Brazil, along with C pentadactylon, which flowered at the ame time. C. IIagei was firt cercribed by Rodriguez, and the

Frg. 83- messer. dubbie and co' sster field at orpington, Eent. (ser p. 484)
after the flowera have faded, and astume a bripht red colour. The same character occurs in the allied genera Mussende and Howardia. There are only two apecies of Alberts, the second being a native of Madagatcar. A. magna is evergreen, and in a handnome Laurel-like shrub when not in flower. It prefere a peaty soil, and enjoy plenty of aunlight.

\section*{Stapelia gigantza.}

A well- flowered example of this magnificent Stapelia has lately been exhibited in the stove at Kew. It began by developing four large flowers aimultaneouly, and bore at the same time thirteen bude in various atagea of growth. The plant is growing in 9 -inch pan aumended from the roof, and ite fleshy, fouraugled utem almont completely hide the pan. As the flowern are each nearly a foot in diameter, and in
greater freedom if treated more liberally in reapect to moistare and heat.

\section*{Scheilea species}

Scheelea is the next M. Martiana (regia) is one of the mont magnificent of all Palms, and whose oval-shaped fruita are known in South America as "Kokerites." There is a grand specimen in the Palm-house at Kow which has been grown for thi Maximiliana, but now that it is in flower, it proves to be apecies of Scheelea. The principal, indeed one might almost say the only notable difference between these two genera is in the atructure of the amall flowern. The Kew plant has pinnate leaves 25 feet long, and narrow pinneo from 3 to 5 feet long, each leaf being gigantic plume as elegant an those of an ostrich. The flowera
name has aince been adopted by Mr. Ralfe, who has paid apecial attention to thim and allied genera for some reare, with the rearlt that a conaiderable namber of speciea bave been added to our collection. C. Haagei has elongated paendo-bulbe 6 inches long, pale green lanceolate leave 8 inche: by \(1 \frac{1}{2}\) incher, and a alender arched ecape 6 inches long, bearing six flowers, each 2 inchen across; the aepals are 1 inch long, lanceolate and keeled; the petals are ovate, flat, and as long as the sepals, their colour being dull olive-green; the lip, which is colonred cream-yellow, with a tinge of row and a few red dote, is nearly round, flat, 1 inch in diameter, acuminate at the tip, with a pair of teeth-like pro-, jections in the ceatre below the top of the slender arching, green colamn. The plant is again in flower in the warm Orchid-house.

\section*{Bulbophyllum Medus在.}

Two plants of this extraordinary species are now in flower in the Orcbid-house at Kew , each bearing two of the drum-stics-like inflorescences. The capes are about 6 inches long, and the globose head of flowerp, which are 2 inches in diameter, are composed of large lanceolate whitish bracts, and amall pale yellow flowers, with eepal tipped with long noft hair-like appendages, which hang down to a length of 3 inches, and are cream-white, with a few mall dull-red spota. The plant is a native of Singapore and neighbourhood, and although it has been in cultivation over fifty year, it is rare in collec. tions. Its other name is Cirrhopetalum. \(\Lambda\) t Kew it is grown in baskets surpended close to the roof in a hot moist house, along with Phalænopsin. It is worthy of a place in all representative collection, and I believe it in to be bought cheaply. W. W.

\section*{Caryoptrris Magtacanthus.}

Not only is this a rare and interesting shrub, but it is also one possensing much beanty. It was one of Fortune's introduction from China, but it afterwards nearly or quite disappesred from cultivation. It was, however, collected in Japan both by Oldbam and Maries, and by the latter was re-introduced to English garden about filteen years ago. It is a member of the Verbens family, and grows to a height of 3 or 4 feet; the opposite leaves are oblong-lanceolate, tomentose, and, as a rule, very coarsely toothed. The mall flower are of a pretty parpliah. blue, closely packed in memi-globalar cymes, which spring from the leaf sxils at the upper part of the atem. The bottom lobe (or lip) of the corolla in alightly fringed, a character which aggested the now obsolete generic name of Barbala. A specimen of this shrab in planted at the foot of the wall of Maseum No. 1 at Kew, and is now very finely in flower. Except in the mouth-western countien of England and imilarly-favoured localitien, this ahrab will probably require at least an equal amount of protection. It was originally treated as a greenhouse plant, but it is an an outdoor shrab that its value is most apparent, for flowering, as it does, in Augut and September, it is eapecially welcome. W. J. B.

\section*{Foreign Correspondence.}

\section*{CATTLEYA CANDIDA (Kth.) Lehm.}
(Sfmar. Cymbidium candidua, H.B K.; Cattleya CHOCOENSTS, HORT.)
In eccordance to the lawe of priority in naming and dencribing plants, I consider it high time that this plant ohould be referred to its original name as given by Kunth. Cattleya candida is one of the two firat deacribed epecien of this genur, and although it was placed with Cymbidiam, Kanth expreased his conviction that it could not belong to that genus on account of ite posseaning four pollinias. The apecies is very well dencribed in the Syn. Plant. by Kunth, and easily recognised by this description. It may be objected that the plant is not a pure white one, and therefore the name candide is not quite appropriate. To this I observe that every author is allowed to name his plante as he thinks best, that there are other plants far leas white and jet bear that upecif. cation, vide Miltonia candida, and that the apecification "chocoenais" is far less appropriate, as thin Cattleys does not grow in the Choco, but in the Cauca Valley, two quite different provinces.

Cattlega candida is a very variable and very floriferous apecies in its natural habitat. The masbes attain often large proportion, are well shaped, bat montly loose and atraggiy at it rhizomes. The flowert are produced from three to five-mot commonly in threes-on a pike, and borne aloft free of the leaven. In the beatatrain of the apecies, the flowers are pare white with the lip pearl-thell-rome at the tube, yellow at the bave, and crimson at the dilated aper. There are ecarcely two planter in which the and of the samenize and colour. It changes from the
deepest crimon to the most tender rose, but always leaving a white margin. Of conspicuous varieties, there is one with pare white flowers except some yellow at the base of the lip, and another in which the eepals and petals are deep rose and the lip of glowing crimson-parple. This latter variety is the rarest!
Cattleya candida is distributed over the valley of the Canca from Tulná down to the neighbourhood of Fredonia and Concordia in Antioquia, and reatricted to a region that extend from 600 to 1100 métres above the nea-level. It grows on trees high up on their branches in dense woods. The climate of the region is very damp for some six months of the jear, and very dry during three months in the time at which the plant flowern. The temperature of the region ranges between \(22^{\circ}\) and \(25^{\circ}\) Centigrade. F.C. Lehmann.

\section*{A Tour in Lombardy.}

The public garden at Milan is one of the prettient gardens in Lombardy. A small stream flowing through the garden, and traversed in various places by ornamental and rustic bridges, beneath a rich and varied vegetation, forms one of the greatess features of the garden. Amongst many noteworthy treen I remarked several fine specimens of the Maidenhair tree (Ginkgo bilobs), Ailanthas glandulosus, which is very common in Lombardy, several fine groups of Magnolia grandifora, ay l some very fine trees of Magnolia conspicua. The latter was labelled M. porphorone, which is probably a mintake. Conifers, especially the Abics and Cedar, were fine. The flower garden was gay with various flower-beda, carpet bedding being the finest feature. In a sabtropical bed I noticed a very showy Polygonam, probably P. filiforme variegatum, which is very effective, with its large green and white mottled foliage. In an adjacent bed was a very pretty dwarf variety of Lantana, fres-flowering and pure white in colour.
Extending all round the town is \& very fine avenue of Horie-Chestnut trees, which, before the storm of 1873 , formed one of the features of the town, but owing to so many branches having then been broken off, they werg topped, and present now a rather atunted appearance. The Syrian Mallow (Hibiscus ayriacus) is used largely for hedges, and at the time of my visit presented quite a feature in itself, so varied are the colourn of the flowers. Having made the tour en bicyclette, I cannot pass Tarin without a remark on its beautiful avenue. Such a variety of trees cannot be found, I ahould thiok, in any other Earopean town, for I noted no leme than nine apecies inclading the Elm, Plane, Hornbeam, Sycamore, Horse-Chestnut, Osk, Sophora japonica, Robinia preudo-Acacia, and Acer, and each rivalling the other in bearty.
After cronsing the Maritime Alpa, a vast plain is traverted through fielda of Hemp and Maize, and a few field of Rice near the rivers, but the crops are chiefly the two former. I was most aurprised to find that fruit is not grown in this part, an the soil and aspect ia certainly favoarable for it. L?aving Muan en route for Genoa, one oon gets again into the famou Vine country, where a good bottle of vin d'Asti is very acceptable to a bicyclint who has done fifty miles before dinner. Riviera.

\section*{FOOD REQUIREMENTS OF THE CHRYSANTHEMUM. \\ (Con:inut from p. 181.)}

Having written my article about a year ago, aud lorg siace got the question answered to may atimfacion, and the present being a basy time, I shail try to answer Mr. Dgke as brielly as posable. I did not write, "I have got a complete analyain of the soil;" but, on the contrary, "if we have not got a complete analyais," which the editor will find in my manuicript, and it is corroborated by what followe. I have farmed the land from which the losm was taken for the lant three or four jears only, and know it therefore to be of poor quality, it having been very badiy farmed by my predecenmor in tho tenancy, but not lacking in potash; and this nub-
stance, if ased alone, or in conjunction with nitrater and phosphates, does not perceptibly increase the yield of any crop, not even Stramberries or root crops. I do not think a well-managed rabbiathheap, consisting of weed (alway with noil adheriag), wood-ashes, and finely-broken charcoal, night-eoil, and refuse-plants, well mixed together, by being turned over several times during a year, is a mach appreciated in England as it deserves to bo-at lent, Mr. Dyke seems to have no faith in its valuena manare; and yet it is the cheapest as well an aseot one available, forming an excellent soil for pof plants, by mixing it with fibry loam, even it that bo of poor quality. Without borsting, I would mention that I have thirty yeara' practical experienco in Eagland, Belgium, France, and at home, at ano dener, so that I ought to know something abont the mechanical and other condition of solls in potting.
Bat to return to the artificial manare quation, I appose I am obliged to quote the mixtures and analy uis again if anybody in in thelua to understand the matter:-

There do not look so entirely different from ereh other or from the ash; in fact, good renulta an generally obtained with artificial manure that in th less accordance with the constituents found in the ah of plants, and if this wan not the case they conld never be used without a complete analynis of tho noil being made beforehand. No, the carae of my non-nuccess is quite different, bat I will retarn to that a little later; first a few words about quantitice recommended, or actually used. When I am going to use artilicial manures for plants in pots, borden, \&c., I ask, what is the largent quantity of similar manure used profitably by farmera? When planta have a reatricted root run and they are grot feeders, and the subatance to be used is of a harmiens nature, I ase double that quantity, and of courro trying to make it composition in accordance mith what in known about the need of the plants.
Now, the rate of application is one of manare to four handred of noil, which comes out an something like 2000 to 3000 lb . per acre, reckoning depth of moil at 7 to 8 inchen (rather too little), and an arerabe weight of 40 to 50 lb . per cabic foot (this varien vers
* These ingrediente to be mired with the soil; the reat in this column to be used as top-dressiogs by-and-by. \(\dagger\) In freth plant.
mucb). Mr. Dgke recommends one of manare to twents-fire of toil, to be mised at once, with topdressings following of \(1 \cdot 16\), or something like 50,000 to 60000 lb . per acre. I did not mix the ingrediente togetber before uing them, they were simply weighed from the bage, strewn on the heap of soil, and at once thorouzhly mixed with it by several tarninge. The ammonis may have been liberated in the soil, bat the latter will aboorb and hold fast a mach larger quantity. So I had my four per cent. of nitrogen beaides that contained in the soil, and in the onefifth of good half-rotted ttable-manure ; and calculation the smoant of nitrogen in this to be 10 to 12 , or 15 lb . per ton, every practical cultivator known that good soil, with an addition of one part atablemanare to four parts of soil is not lacking in nitrogen when first mired and for some time afterwards. In fact many Chrysanthemum growers ubtain good result with this alone. And yet I came to the same conclasion as Mr. Dgke in regard to Chryanthemam potting-soil lacking in nitrogen, an notwithstanding the good supply of nitrogen at hand, the plante ware nuffering for lack of it, because they are able to absorb it only in the form of nitric acid, and not as ammonia; not even the alphate of ammonia (not organic) coald be transformed into nitric acid. Otherwise this would be quickly done by Cbryanthemum planta afforded alphate of ammonia, and with about the ame reault an Mr Djze gets from pitrate of mmonia, viz, the appearance of very dark green leaven in a few days.

Here comes the only difference of any consequence in the componition of Mr. Dyke's manure and mine. H9 afforded nitrates, and I ammonia (or organic nitrogenous abatances), and his plants obtained thair nitrogen from the nitrates and not from the soil. But it is quite impossible for Chrys. anthemams to be manured solely by artificial abstance independently of the soil naed. We want a concentrated, effective, but above all, barmless aupplementary manare-and kainite, at all evento. is not such a one. The price of an article is also of soms convequence, and it should be bought in quantity and not in amall way at a high price st the draggiste.

I cannot eee the force of Mr. Dike's remark about the harmfulnes of chlorine, sulpharic acid, and lime, when he himelf asen the ame aubatancen in a much larger proportion to noil than I do, and with good results. His proving that Chryeanthemum may be grown in oil containing 1 part of the abovespecified manure to 16 (or 25) part of aoil is very interesting. M. P. Andersen, Jönköping.

\section*{ORCHIDS IN THEIR HOME. (Continued from p. 423.)}

Cattleyas - The Cattleyas are found at from 2000 to nearly 5000 feet above ea-level, almost invariably growing on living trees, on the tranks or in the forks of the branchen. They always try, as it were, to establish themselves in places where they receive abandance of light and a glimpse of an. Sometimes, indeed, they aro exposed to the fall aun. The latter, as a rule, are the best plants. At the lowent elevation they will persistently follow the course of atream. Higher ap they may be found growing in deep hollow or gallies, and at the last stage they are found in all exponares. This is eavily explained by the atmosphere being charged with more moisture than at the lower elevation, where a dryer heat prevails. Most of the Colombiau Cattleyas and also other Orchids have no well-defined resting periods, as far as I have observed, within almost two-third of the entire territory. There are two rainy and two dry seasons in the year, while even during the dry messons it is not an infrequent occurrence to have a shower of rain now and then.
Plants of Cattleya Triansei are found in flower almont the year round, yet there are two marked flower seasons, December to January and May to Jane, the latter being the chlef. A numbar of plants would have four and five flowering leade already fully up, with another half-grown break at its base, while very often a third would be starting. Such breaks
alway seemed to grow and mature in much less time than the mother balb, in order to, as it were, in one united effort display their floral treaure.

Geographical Range.
The Repablic of Colombia is very rich in Orchids, the different species being spresd over it entire territory. The greatent namber of apecies, however, is probsbly to be found on the eantern foothill of the central Cordillera, which is a continuation of the Peravian and Equadorian Andee; but apon entering Colombia they branch out into three diatinct chains, known as the Central Cordillera, the Eatern Cordillera, and the Weatern Cordillera, forming between them the immense valley and river rintems called the Canca, the Magdalena, and "Los L'raos de Sto Juan," or the "Cazanare" This latter immence territory in drained principally by the \(\Lambda\) mazin and the Orinoco aystems, great atretches of wich are an yet anexplored.
The State of Tolima may be connidered an the home of Cattleya Trisnæi. It follows the eastern foothill of the Central Cordillera from about the necond degree to about the fifth degree northern latitade, and at its mouthern limit it is diatribated over all the three chains. This latter region is also the home of OJontoglomm crispum Lohmanni.
Cattleye gigas takes the place of Cattleya Trianzi further northward, where it extend between the aixth and the eighth degres northern latitude on both the central and eastern chaina. This territory is exceptionally rich in usefal specien, sach as Cabtleya chryatoxa, Miltonia vexillaria, Ojontoglonam luteo-purpareum, O. aceptram, O. coronarium, O. Wallinii, and O. Harryanum ; alno Cepripediam Schlimii, Maxillaria lateo-alba, Epidendram fimbriatum, and Meadevallias in variety. Sanean, however, may be considered as the principal diatrict for the latter.

I found Miltonia vexillaria as low an 2000 feet above sea-level, and as high an 6000 to 7000 feet, but at the first.mentioned altitude the p'ant were generally very mall. It generally grows on amaller trees and branches of Melastomas and Quercue. Odontogloasum coronarium is found at a very high altitude, often growing on the ground or in mass, where it ramble for yard until it find a tree suited for it requirements. The magaificence of the flowerspike nurpanee imagination.

\section*{Odontoglossum cetspum,}

Oa the Eastern chain Odontoglonsum crivpam is found, principally between the fourth and sixth degree northern latitude at an altituje of 6000 to 9000 feet. The best plants and the beat varieties, however, occur at 6,000 and 7,000 feet elevation, where they grow in occasional openings of the foreats on the tranki and branches of large trees, and where there is an abundance of light. In company with O crispum grow O. Lindleyanum and O glorioam.
Farther northward, or in the atate of Santander, Cattleya Mendeli occars, and on the eagtern foothills of the eastern Cordillera, Cattleya Schroderm. On the Weatern chain or along the Rio Cauca, Cattleys Chocoensis is found. Ualike its allies, it grows to a great extent in forests on level land, stretches of which are wampy and unhealthy. This Cattleya is very abundant in certain place, and grows invariably on trees. The flowering reason is Auguth and September. In thia region may aluo be found Odontoglossum Roezlii, growing in a comparatively high temperature.

\section*{The Exd is Approaching.}

Many of the New Granadan Orchida are rapidly decreasing in quantity. Cattleya chrysotoxa is very near extinction, Miltonia vexillaria is going fast, as are also Cattleya Mendeliand Odontoglosenm cispam. Miltonia vexillaria and O. crispam increase rapidly from eed, where the foreats are not already dertroyed, or they would have bsen extinct ere this. The native are also beginning to deal more considerately with the forests, beside which many of the landowners and even the respective governmenta are taking precautions againet the total destruction of their mont beautiful jowels. And can you blame them: From a lecture by John E. Lager, reported in "American Gardening."

\section*{Forestry}

\section*{INSECT ENEMIES TO TREEF.}

The best athorities asert that bigh cultivation and the proper rotation of crope is the mont effectual remedy or preventive of insect attack, and is many cases it ia the only practical one. So far at this country is conceraed, it may be reasonably contended that the ibjury canned by few, if any, inaect attacke to which our crop are liable, equel the injary caused by a single night' frost in May or June, or a severe hailatorm later in the seaton. This is probably the reason why cultivator in general pay so little attention to iarect peat outside gardena and forcing-houses, where preventive measures cal be adopted with good prospect of nuccens, doabtlete thinking it useless to atrain at the gat when they have already wallowed the camel.

If thi be generally true of farm crops, it is mach more when we come to forest trees. In this connection it must be remembered, however, that oar treen in 13 -itain are free from many of those insects which commit euch serious ravage upon the same kind of trees in continental forents. The Scote Pine with ut hat no very dangeron foe among the Lepidoptera, while on the Continent it hat at least three which may be thas classed. Among beetles, the Pine-beetle and Pine-weevil are certaialy troublesome, but considering that the very exintence of the former is practically ignored in most parts of the country, it has evidently done lens permanent injury to Pine tree (jutaide mall plantations and isolated clampe) than it habite would lead one to infer. The Pine-weevil is priacipally conflined to the northern part of the kingdom, and from its size and habit of attacking mall and neialy-planted trees, in brought into more prominent notice than would otherwise be the care. The Pine aw-fly again, although occisionally assuming a dangerous aspect, gives little troable as a rule.

Coming to deciduon treep, where have we a pest which give ut any real caune for alarm? The OLkleaf roller-moth, Tortrix viridana, otrips our Oake to winter barenss in dry and blighty eprings, but the midsummer shoote put mstters right in the course of a few weeks, and the treen neem but little the worse. Many insecte, especially beetles, doubtlem get a bad name from their well-known habit of attacking old and half-dead trees, and thus bastening their natural decay; but in this they merely act as Nature' scavengers. As a matter of fact, an attack by any of the bark-beetle opon a tree, or part of a tree which atill retain a westige of life, is extremely rare. The least flow of sap in sufficient to stop the female in her boring operation, and numbers of commenced bat abandoned galleries may be noticed in trees which are practically dead, but in which life atill lingers in one or two branchet.

Fur our comparative immanity from auccenaive and serious attacks of caterpillar swarme, we probably have to thank their natural parasites and enemies. Where haman being are at all crowded together, there epidemic direates occur; and the invects would seem to be affected in like manner, for a year in which a seriou: plague of these creatures appear is often followed by one in which they are comparatively rare. Bacteria and other form of parasitic fungi probably play a great part in regulating the numbers of theme prolifle creaturem, and were it otherwise, our trees and ahribs would be deprived of every green leaf. A pair of moths or beetles may bacoms the course of anmmer, to it may easily be imagined what would happen if this went on anchecked for a few years. As it is, attacks of caterpillars sometime occur in the Pine and Sprace Fir forente on the Continent, which threaten their very existence, and even affeet the prosperity of the diatrict they infent.
As an inatance of this, it may be mentioned that the attendance at everal German watering-places on the Baltic coast hes seriously fallen off owing to the swarms of caterpillars in the neighbouring Scote Pine woods. These caterpillars are farnished with long and poinonous hairs, which, at the periodical
catting of their skins become detached, and poison the rery a! monphere over a coniderable area. Bat sach cares an these in this country are not among the probabilities, and we may asfely confine ourselves to easy and inexpensive measares of preventing, or rather allevisting, the more severe attacke which occasionally occar, trusting to climate and natural Jawn to do the rest. A, C. Forbes.

\section*{OLD-TIME ADVERTISEMENTS.}

A collection of last-century newapapers lately came into my possession, and it astoniahed me to find nambers of advertisement having reference to the seed and naruery trade in their pages. I have called the following quaint annoancements, which cannot fail to intereat many in the present enlightened days, as they merve to illastrate the desire of traders to use the Press as a means of pathing their wares, even in times when newapapere Ead but a very limited circalation. Seedsman.

\section*{From the London Journal, Jaly 15, 1721 :-}
" Jast brought over from Holland, a fine collection of Orage and Lamon treek, both p'ain and variegated, with the fineat cream and yellow colours, of the best sorts, fall of fruit and flowers, of all aiz's, fit for the Orangery, or to adorn ladiea chambers. To be sold very cheap, by James Letley, at Mr. Frasier's, next to Beanfort Hoase, near the wateraide at Chelsea; where all gentlemen and ladies may be farnished with the most carious forms of bulbous roots from Holland, and other parts of Earope, at the lowest prices.

From the Country Journal, November 15, 1729 :" To be wold, a parcel of atandard Elms, of about eight years' growth, now standing and growing at Mr. Jamen Norrin's, nurteryman, the backnide of Lambeth Welle. Eaquire of the maid Mr. Norris, who is emponered to treat with any person for the same."
"German Dogatail Grass-Bweeter than other grass, and makes with weedings as beautifal lawns as the closeat shaven bank. To be had in papers done up at 5 se each at Gregge Coffee House, York Street, Covent Garden.

Also American Cabbage weed which comes to 80 lb , weight and near to \(£ 40\) an acre valua, price 10s. per pound. Hangarian Clover exceeding Lacerne, price 7 s .6 d . per pound."
Here is an announcement of quite another character, which clearly portrays what a jovial time the foriats of the day must have made of their exhibitions. It is taken from the Kentish Gazette, April 13, 1776:-

To the florista. On Tuesday next, the 23rd inst, there will be a Polianthan feast at Mr. Richard Pain's, at Waldenhare. The beat flower prodaced will be entitled to a prize of \(108.6 d\)., the second bent to 7 s. \(6 d .\), and the third to 58 . No permon will be admitted to shew a flower, unless he hae subscribed 18. one month before the day of shewing, or \(28.6 d\). on that day. No person will be entitled to a prize anlese it is rose-eyed, has six pips, and in the honse before one o'clock. Much company expected. Dinner on table at one o'clock."
A carious illustration of a plant in pot accompanies this notice.

From the Evening Post, March 29, 1287 :
"Frowres.-John Allport, seedsman and nurseryman, Hackney Road, bega leave to inform those ladier and gentlemen and the public that he hae now in fall bloom fine Rosep, Pinky, and other curious Forced Flowers in Pots and for Nosegays, and will continue a anccenion all the season, Likewise Greenhouse and Hardy Planta, Treer, Carnathons, Flower Roots, sce, alvo all kinds of Seeds for the Flower aud Kitchen Garden warranted of the beat
The Newcastle Alvertiser, October 30, 1790, con-
tains a leacthy adrertisereant for-
" Fruit and Foren Treat
"Fruit and Forem Trees, Floweri
Shrabe, of John Richward \& Coring Leith Wergreen
series, Edinburgh. Standard Apples are figured at \(6 d\) erch, D жarff, \(4 d\)."
The Leeds Mercury, November 30, 1793.
"Thomas Barney, Nurwery and Seedeman, Briggate, Leed, bega to announce that he has received a fresh aupply of Garden and Bird Seeds. His Nursery Stock is joung and healthful, notwithatanding what some evil-diaponed persona may have anid to the contrary."
The Middleses Journal for February 15 to February 17, 1766, contains the following curions advertisement about a specien of grass that is now handled by the ton:-
"American Cock's-foot gram yields larger than any other, lasts for ever on the land, and smothers all weeds.

\section*{The Herbaceous Border. \\ TROPEOLUM SPECIOSUM.}

There are few finer hardy climbing plant than the brilliant-flowered Tropæolum apeciosam, where it does well. To any one deniring to give it a trial, the present season offere a good time to make preparations by ecaring fresh and plump roots, which are unally to be obtained in pote, and planting them without delay. One of the chief point to be observed is, to plant the roota 8 or 9 inches deep; there is no necessity to disturb mack ground, and it need not be dug deeper than 1 foot. Place a little decaged manare in the bottom of the hole, covering this with aoil, and make it firm. Then plant the roots at the depth atated, and make the woil quite firm over them. The plant appears to prefer a firm soil and comparative dryness, seeing that it more frequently succeeds in a hedge-row, or at the foot of a dwelling-house wall or some similar place. It dinlikes frequent disturbance. Where it can be entablinhed, it in an excellent plant for covering dark-leaved thrabs, and in such positions it profasion of brilliant flowers display themselven to great advantage. J.

\section*{Chrlone barbata.}

This is a beantifal hardy herbaceoun perennial plant, an abundant bloomer, with apiken of light acarlet coloured flower, which grow 2 feet high; it is, in fact, a Pentatemon in miniature. A plant of this species has been in flower at Basing Park for four monthe, and atill keepa ap a brilliant show by throwing up constantly new flower-apikes. Ordinary garden mould suits its requirements, and it is so hardy, that without any protection it withotood the rigours of laat winter unharmed. Propagation is by division, and seeds nown in the month of April. These needlings flower at the end of the firat aummer. Wm. Smythe, The Gardens, Basing Park, Alton.

\section*{PRUNING FRUIT TreEs.}

Agtir reading this paper a week ago, I thought the description "mont interesting paper," should be altered to " most extraordinary," coming, as it does, from a frait-grower. I shall aay nothing more about Mr. Pearaon's description of the different achoois of praners than that it is imponible to identify them by it ; but when he deacends to practice one can deal with him. He eays the first object of praning frait trees is to obtain fruit, and further on he add apeaking of standards-" that all branches mast be so dimposed as to admit the cunlight and air into the middle of the tree for without this fertility was impossible." Will any fruit-grower who really knows how an Apple or Pear tree develops itself endorne this statement? A tree can, by much needlese matilation, be made to grow in the shape of a basin, which is the plan of thone who admit light " to the middle of the tree; " and I once worked in a noted garden where the standards were all of that shape inside the walls, but where the chief mupply of fruit came from an orchard outaide, where all the treen were unpruned, and of the shape of umbrellas were
or lest, in which no light or air in the sente uader. atood reached the middle of the tree at all, and I have noted thousands of similar examples aince Left to itself, a frait tree produce a round, or, a Dr. Lindley aaid, a "hemispherical" head, "tomarde the outride of which frait-apara and leaves are mon abundant," and this is the kind of tree (the opponit of Mr. Pearson's) that every casaal obserpertit familiar with, but in which, according to Mr. Perro son, fertility is "imponsible." This shape sho produce the greatest quantity of frait in a given time, and exposes the fruit to the ann and air better than any other form, no matter whether the tree bo dwarf or tall. This fact is so evident everywhere that one wonders to hear it questioned.
It is amusing to read Mr. Pearson's contradictorn directions on the subject of standards and contina In their habit of bearing frait there is not mithan difference. According to Mr. P., young mererd Apples, Pears, and Plams are to be cat back inthin shoots to one-third their length. This is to xum "form," \&ce, though in what way this necures my. thing bat a maaller tree and leas frait, under equil conditions, is a pazzle. Cutting two-thirds of 1 healthy tree away for the rubbish-heap is an extro ordinary idea, bat in his cordons the leading hoot are, we are told, "left as long ae ponsible, bearing in mind the fact that the more one pruned amat tho atronger would the growth be from the remsining buds, let them err rather on the side of catting amy too little than too much." Exactly! and it in the same with the individual shoots of standarde, pretically cordons, no shortening being needed except to secure balance and prevent a too atraggling habit. About ten years ago I gave one of my men some Apple tree for his garden, on the condition that he never touched them with a knife, which condition has been obwerved, and the treen are now of the "imponible fertility" shape, but marvels of fruitfalness all the same. Bat individual examplen are apertlaons, for no one cin help reeing auch as I deacribe, anywhere. If the "little band" of mutilators which Mr. Penroen alludes to atill exists, the sooner it follows the "ten little nigger boy" the better for fruit grower, I should say. I am at one with the Rev. W. Wilks of the Royal Horticaltaral Society, in his paper read at last year's conference, and published in the cramactions, in which he "is strongly of opinion" thas joung atandarde, half atandardm, and buah trees "need very little pruning at all, and that you will do lens harm to your treen by leaving them sill quite unpruned, than to allow ignorant experiments to be made upon them," and Mr. Wilkn, like Mr. Pearioo, is writing for the "ordinary amateur." J. Simpoon,

\section*{A FIRE. TREE.}

Frow the Foreign Office Report for Jals, 1895, on the agricultural products of Tolima, Colombin we extract the following particulars relative to the Chaparro tree (Rhopala obovata), and its monderfal facalty for aurviving under circumatances fatal to other forms of vegetation. It power of reisting the ravages of fire is particularly remarkable. Thus, we read that, in Tolima, "no conservation of the natural fertility of the land has ever been taken into consideration. Oa the contrary, the natural grasses, intermized with acrub or brashwood, hasto been aytematically burned from year to year, and the barnings effected during the most acorehing periods of drought. The principal object attained by thit process of despoliation is the reproduction of nen and tender herbage or pastarage, which, with the adrent of the rainy meason, forthwith covers the parched sarface.

This peraistent barning of the navannahs and hills for crops of renewod patarnge, plays desperate havoc with all other vegetation, tres, and brashwood. Isolated Palm trees, with thuir intensely hard trunks and endogenous arracture, together with groups of bruchwood in sheltered or hamid apota, nometimes withatand the fary of the flames. There is, however, one phenomennil excep \({ }^{-}\) tion to this subversive power of the Lires. A hamble tree, with contorted and rugged trualk and branchet
and eabrons leeves, a tree presenting the most abdued and weird aspect conceivable; thie pigmy tree not only resists the fary of the famer, but fire in actanlly congenial and abservient to itn existeace, for the tree, inatigated by the confagration, form itself into great plantations. The name of this tree is Chaparro (Rhopala obovata), indigenou to Colombia and other South American countriep. It attains height of 15 to 20 feet, and it distorted trunks measare from 3 to 12 inches in dimmeter. It is widely diatribated in Colombia, for I have found it at the Sierra Nevade of Santa Marta, and
plantations. There is a popular belief in Tolima, where alluvial gold abounds, that this tree flourishen only on thone sedactive lands, nerviag as aguide to searchers after the precion metal.
"The bark of the tree is peculiarly constituted. It conaists of a congeries of integuments or semi detached layera. The outer portion, about \(\frac{3}{3}\) inch thick, performe no organic fanction, and this portion of the bark, in conjunction with it peculiar compoaition, protects the inner vital integument from idjury by fire.
"The form and structure of the tree may have

Fig. 81. - ODONTOGLOSSUM COBONARIUM,
(In the Gardens of W. W. Groves, Eeq., The Larches, Alderley Edge, Chashirs.)
dispersed inland 1000 mile from the sea. In contact with the great foreat, it maintains a precarious existence. Bat, as already explained, it unurpa dominion in places where no other tree can grow. In Tolima it abounds on the slopes and ridges of the hill at elevations from 1000 to 3500 feet. In this department alone handreds of equare miles of the lower hills, which have been reduced to aterility by incesant burninge, are occupied by this diminative tree, and it assumes the aspect of vant aystematically formed and well-kept plantations. Thi is more than a triumph of the 'survival of the fittest.'
"It is very remarkable that these fire-begoten plantations are nowhere crowded to excest ; on the contrary, the trees are so regularly placed that their sapect vies with that of the most carefully-formed
originated from the eovere ordeal through which it has aurvived. For instance, according to the theory of natural election, tome animale when they migrate into a colder climate become covered with thicker fur. At we have teen with regard to thie plant, the powers of nature have been encroached upon, ie. the plant having emerged from a state of nature it has made for itaelf a law of ite own, for it hae triamphed over the moat dianatron element to all organic life.
"The hundreds of quare miles of worn-out latd covered by this beneficent tree in Tolima alone are andergoing a nlow process of amelioration, which, moreover, could be easily accelerated by the interposition of a fow vimple devicer.
"It is noteworthy that the Chaparro prefer the
sloper and ridges of the hill to the fiat savanuahy on which it is seldom found in any conaiderable quantity, though widely dispersed. Fire rages with far greater fury on the slopes and ridges of the hills than on the plaine. I, however, nttrihate thi preference of the plant for the hill-aides to the pernicious infaence of the accumalation of water on the plains daring the rainy season.
"The illutrious Humboldt, during his travels in South America, noted the dieperal of this plant on the vat llanom atretching from the Orinoco, \&c. These llanos are, for the most part, dentitute of vegetation other than Graminese. The only trees that were found on many parts of these dreary wates were pecimen of Chaparro, and in more hamid epote a Palm. Thus, referring to the llano which he traversed, he aays, 'for many iquare miles not a tree to be seen, but where a few solitary trees are foand they are, is humid diatricts, the Mauritia l'alm, and in arid pote the Rhopala complicata.'
"Vast deserts and nemi-denerts abound throughout the tropical world, many hundred of thouaand of qquare mile:. It may be that the Cbaparro in deatined to play an important part in the reclamation of these illimitable wates, for the decomposed leaven gradually form a cruat of vegetable mould."

\section*{ODONTOGLOSSUM NARIUM.}

The mpecimen of Odontoglosum coronariom in the collection of Wm. W. Groves, Esq, The Larches, Alderley Edge, Chenhire, is notable one. It in growing in a equare teak raft abcut '2 feet quare in a mixture in which growing sphagnum mose predominates; the whole aurface is a living mase of sphagnam, and beautiful it looks with the great coriaceous peado-bulbs attached to rhizomes apring. ing from its midat. There are eleven auch pseudobulbs clad with leaves, and other rid of them forming feeding auxliaries. The representation (tig. 84), shows the habit of the apecies, and ind cates in a measure the atiff leathery-like leaves crowning the peeudo-bulbs, which are ovate and entire, and thick and leathery. The fower-spike apringe from the matured growth; and even the second from the lead which is thoroughly matured, must wait its turn for floral development. The spike is carried on a atrong footstalk, and the flowers are crowded to uther not anlike a Hyacinth spike. There are twenty-four auch flowern on the stalk, each of which is about the size and form of an ordinary O. crispum. The dorval sepal is ovate; and the two inferior one rcci-linear-ovate; the colour ia rich sienna with golden crimped edgen; the petals are ovate, bluntly acuminate, with golden cioads abining throogh the sienna-ground. The lip is ensiform, the throat bright, a brown crest, and an orange base; the column is thort, almost sesaile, with the wing yellowish, tinted with Indian-red. The freckled-coloured column imparts a certain atyle of beanty to an otterwise diatingainhed member of the tooth-tongued Oncid. It is kept in the cool air of the : ©dontoglonum-house, and is afforded a copious rapply of moiature. The plant is now so large, that we may expect to see it flowering year by year. No check in the way of drying, or pushing with extra heat is at any time practived. Mr. Groves' beautiful plant is ander the charge of Mr. Edwin Robertshaw, who is caltivating not only the Orehid, but all the other department under his cbarge, with marked ability. J. \(A\).

\section*{OUR P O ULTRY. \\ By Harrison Weir. \\ (Copyright.) \\ (Continued trom p. 238.)}

A: shown, the introduction of the Sbang-hai and Cochin fowl has had the effect of aerionaly depreciating many of our Eaglish breed for table parpoces; the large coarse bones, thick akin, and lack of brest meat, conpled with a considerable amount of fat, and a peraintency for incubation, has rendered the
crossing with the old Eaglish fowl both dark fleshed avd strong in flavoar, and to most persons' thinking unpa'a:able. And yet this crossing and recrossing, and Mongulising goes on, and seemingly with the approval of a pablic apparently ignorant of what a goo3, really good, high quality fowl ahould be.
Ba; another mischief has arisen, and that in, that there is a supposition that a baff or coloured egg possesten greater richness of llavour, and is more nutritive than the old Kant, Sassex, and Surrey foxl's white egge, forgetfal, of coures, thas not only does mach depend on the food, rans, the wools or pastures to which the stock is confined or has access, and a'so what the one and the other bas to maintain in fall health, and deliver when hatched the nameizzd chick; therefore, the difference, if difference there it, must be very slight indeed, if any, possibly that of the higher clase table-fowl, may be more delicate. Bat the absurd preference by some for a coloured egg shell goea far to prevent the farmar and raicer of poaltry from having any but those of tha Asiatic cross, becana there is in some localtien, though happily not io all, a more ready anle for theas than the purely white. For my own part, I prefer the fine-shelled white, sach as the Himburghs and old Eaglish game, or the larger \(K \rightarrow a t\), Sassex and Surrey old breeds.
Next, I muat call attention to an excellent breed of French origin, called "Houdane." These came into favour some forty years aince, and gained at oncs much notic, and that of a favourable character, an being unefal for the table, and layers of an unuaual quantity of medium-sized white eggr; they sre evidently a cross with what is now termed the Polish" and the old five-toed foxl, that has been known both in France and England for centuries. They are good foragers, and of a medium nize, rather abort on the leg than otherwise, with round, fall, plump breaste, though longer in the body than our old Kents, the flesh is white and delicate, and they generally fatten well. On their first importation, they showad more clearly their origin, baving but small sop knote, and the cavernous nostrils of the Pulish or Hambargh, and the large frames of our five-toed fowle, which is also a part of their development. Their colour, when first brought into notice here, was white speckled with black, with mainly, if not sometimes entirely, white legs. Now, so fashion willa it, they are black with white apeckles and dark lega freckled with white, and the top-knote are conaiderably enlarged, to their detriment as a farm- yard or farmer's fowl, insumuch as it is liable to get clogged with mad, and to render seeing someWhat difficalt; atill they may yet be considered both areful and ornamental. I have not found them to be rood sitters, and some strains are said not to incabate at all. The chickens are very fragile, and if the weather be wet and rainy, they are difficult to rear; and are, I think, very liable to croap or severe coldr, unleas they have perfect freedom, and are allowed in suramer time to "roost out," which they will readily do, being excelleat flyerv. I may here mention that most pualtry is benefited by having as mach air as possible. Life in the open, in woods, cart lodges, \&c, suits them far better than hen-houses. My own, juat baitt, have no fronts to them, or if it is necesary on sccount of fozes, wire fronts might bs pat. with wire-netted doors. Many years ago I adopt d this plan, and found it wort auccessfut, though evin then many of the fowls, both young and old, would roort in the trees or on the faggotestacks, and this even in winter.
Nox that I have written thus far on the wabject, I would like to call the attention of my readere to the fact, that if they require ang information on the subjectis a'ready dealt with, I shall bo moat ready to give it as far an I am able, aud alro to receive letters of experience of the variou moat welcome; and gerdenert, \&cc., which will be moat welcome; and for this reason, that it is well to know of the diferent breeds under certain confreotom in high, low, damp in runs, of of perfect be it snown that ander such varied cocalitien, for
narroundings, poultry, like all elze, is often materially altered either for the better or the worse, and some breeds more than others.
Taere are other French breed besides the Houdsn; the best, ponsibly, is the "Cièvecoasr." It is a fiae, large, handsome fowl, broad
and thick made, and is black, with a top-knot, and thick made, and is black, with a top-knot,
muffled and bearded. The carriage is upright, and nomemhat imposiag, the tail large and full, and carried high; the legs are black. But as a tableto al it atands in high estem, both here and on the Continent, where, when well fatted, it fetches very high prices, the les'3 baing remarkably white, short in fibre, rich and delicions, besides which it is wellproportioned, with a large, full breast. It is not quite adapted to our climate, oftentimes safering from weaknens of the legs, and is sabject to colds and catarrh. It is not what may be termed a good layer; but in this respect nome are better than otherg. The chickens also are not over-hardy, but generally do well after they have got their "headfeathering." They require keeping warm and dry, and when the land is wet it is almost sure to bring dieaster, if not total extioction; and yet when all thing are favourable, there are few better fowla for the table, if any, when black lege is not a consideration.

\section*{THE FLOWGR GARDEN.}

\section*{By Bailey Wadds, Gardener, Birdsall Gardens, York.}
rockeries and hardy ferneries.-Carefu! attention should now be afforded strong-growing trailing plante, thinning, and making them trim, so that they do not overgrow maller and more delicate plantr. Remove decayed foliage and flowers from all plants, pricking over and top-dressing the soil about Ferns and alpine plants. For the latter purpose use loam, mill-atone grit, leaf and peaty soil, panhing it into the crevicer, and covering the roots that heve become exposed. The planting of Crocus, Talips, Squilis, and other balbs and apring flowering plants thinly in vacant places about the rockery affords brightnesa in the spring month. Fillen leaves should be gathered ap frequently, as if allowed to lie about, the plants are rendered tender, and liable to ir jary by fros?. If the formation of a rockery is contemplated, there is anally more time at this season than any other to do the work. The question of introducing rock work into flower garden should be carefully consiáered before it is undertaken, as there are much labour and expense attending its formation, and the resalts are not always satisfactory. It should always be of a size proportionate to the size of the garden. As a rule, rock or mounds of roots are not nice in fine gardene, but they may be made interesting and effective when arranged with trees and shrubs as an approach to a kitchen garden or other department. If it is intended to cultivate alpine plante apon the rockery, a knowledge of the requirements of the plante to be grown is very necessary, some apecies requiring shade, others partial sanshine, and others again fall munhine. The beet place for alpines is the rockery, and the worst the rootery. The soil may consiat of loam, leaf-mould, and peat, warying in depth from 3 to 18 inches. Roots nad atamps of trees may be used with advantage for the formation of mounds for Ferns, herbage ceoas, perennial, and trailing plantr. In all arrangements of this description a good sapply of water in necesaary for forming basins, fallo, and fountains, and it should not ba forgotten that perfect drainage in necessary in a rockery. Limeatone, sandatone (millstone grit) are the best norta of atone to ure. Good varieties of alpine planta are obtainable at many good nurserien, to that it is not necesary that I give a long list of namen in this article. Many of them are extremely beantiful in spring and throughout the ammer, and their cultivation, if mometimes associated with difficulties of various kinds, is a source of great pleasare to lover of plant. The ame may be asid of the Ferne cultivated on rockeries and rooterien, of which there are namerous apecies and varietien, and nome are indigenous to Britain. Providing there are shade, moitare, and variety of arpect, Forns neper faill to

THE KITCHIN GARDMM.
By Joerr Lambert, Gardener, Povis Carkle, Welehpoed,
REFUSE HEAPS. -The weather having become wet, the garden work men will be emploged at jobs which do not involve the trampling of the soil, and one of these is the tarning over, siffing, and mixing together of the accumalations of various kinde commonis called rubbish heapa. The rougher portions may be thrown into large heapp, loog
stable litter being mixed with them, mixing is stable litter being mixed with them, mixing is
altogether in one large heap. This mates tin cellent dressing for various. crops when ex. rotted. Common salt or lime may be added u the work proceeds, bat not both to the same bees. In two years such a heap of materials will be quitity
ready for use, if it ha been well tarned one ready for use, if it hav been well tarned over once or twice. Some refuse can only be dealt with by bana. ing or charring-that is, by an open fire or a conmy one. Whichever method is alopted, the nemiay
should bs ecreened, and pat by for use. Chume refuse is one of the fineat thinga for a gromer to bave a good stock of for other parponer buita those of the kitchen garden.

TOMATOS, - No Tomato fruits should have beas kept outside till this date, but all with a faint tinge of colour should be got inside. A good plan mbero many fruits are yet left on the plants in a quith green state is to cat a good portion of the atem, wd put a tie to it, and hang it up in a cool rinery or Peach-honse, where, if kept dry, they will ripen on and afford fruits for a long time.

CARDOON8.-All thuse plants which are appro. tected by hay-bands may now be bound round. Soil may be puts to the atems when it is in a fit condition for the parpose. Thia vegetable is not grown no mach as it deserves to be, because perhapsitit bat littio known to c coke or their employers, bat once nent into the kitchen it is generally asked for again, making as it does a little variety in the list of vegetables, Atier blanching, if there is fear of the atems rotting from moiature, take them ap, but leave the hay-bands round them, and atand them in nome cool dark plaes, where they will keep for a considerable length of time.

\section*{THY HARDY FRUIT GARDEN.}

By W. POpe, Gardener, Highclers Casthe, Newbwry.
PEACHES AND NECTARINES ON WALL8.-Thes trees may be lightly switched over with a new birchbroom in the direction of the branches, not in the reverse way, or the bads will get injured. By thus detaching those leaves that have done their work and are ready to fall, anshine will be enabled to mature the present year'g shoots. If theme were laid in too thickly, it will be well to lessen their numbers even at this late date, rather than leave them until the apring praning. A distance of 10 to 12 inches apart is close enough for bearing-wood to be laid-in, though it is the more common practice to lay-in the mmmer thoots very much closer than that, and the realt is green, halfripened wood, and hosts of insect beneath the closs canopy of leaves. Half the failures in out-door Peach calture are due to too-close training, and the consequent immaturity of the hoots. When most of the foliage is cleared off, the trees may be nit nailed, and the branches loosely buadled up with trips of bast, fastening them to the wall bere and there, 10 as to prevent injury from the wind; thin will tend to still forther harden the young shoots by allowing a free circulation of air about them, and it will also afford an opportunity for atopping ap all nail-holes and pointing the brickwork, a job that is beat done before evere weather sets in. If lifting and tranoplanting operation have to be done, these hould be undertaken without delay, taking care in disging ap tho treen to preserve as many of the fibrou root as posuible, but ampatating the larger roots with a starp lnife after the treen are out of the ground. A few wheelbarrow-load. of fresh turf losm should be worked carofully in smongat and placed over the roots as the planting proceeds, and the ataple soil, if fairly good, may be used to finilit off with. In the planting of all fruit treet, bottom of the hole in which the tree will stand should not be more than 10 inches below the nitrace when firmly trodden regularly all over, and the ready for the reception of tree; and nome of the roots may be laid at this depth, bat the greates number at tarious depthe up to within 2 to 3 incbels of the eariace of the border. There will inevisthe be some smount of ninking; and at the finis bore newly-disturbed oil ought to stand 2 inches sbor
the level of the reat of the border, and the trees be loosely secared to the wall. Finally, malch the ground with balf-decajed manure.

HINTB ON WORK IN GENERAL.-In any open weather, rua the hoe through the froit-quarters, to cat of all small weeds that may have aprang ap, and to keep the suil in a healchy condition. Nawly-formed Strawberry plantation will be benefited by the same kind of labour. Continue to make preparation for the planting of frait trees, if sach is contemplated, bearing in mind that planting in wellprepared soil at this season is a season gained. As soon as the trees arrive from the nursery, unpack them without delay, and lay them in damp soll till the planting can be done. Saitable permanent labele should be got in readiness for each tree, stout atales, fce, and whatever else is likely to be required.

\section*{TER ORCHID HOUBES}

By W. H. Wherte, Orchid Grower, Burford, Dorking.
vanla tricolor.-Few Orchid have a more atately appearance, in or out of flower, than Vandas of the tricolor section, bat unfortunately, from wrong ireatment, they often lose a number of their lower leave during the growing teason, and eapecially after a hot dry summer. Sometimes this is caused by allowing the plants to carry too many flowera, but it is usaally the result of high temperatare combined with aridity in the atmosphere, or it may be caused by subjecting the plants to a severe drying off in winter-a procesm many growers think essential to their free flowering. Give them fair, generou treatment, and no difficulty need be experienced in growing and blooming the plants. All that is necessary is an even intermediate temperatare, a constantly moist atmonphere, accompanied by more light (but not direct hot anshine), and more air than in generally afforded them. If no proper inter-mediate-hoane is at command, I would place the plante together at the cooler end of the Cattleya division, keep a decidedly moist atmosphere sbout them, and use the ventilators freely whenever the external air should be more than \(50^{\circ}\). Oar planta are now in a similar position, and the bottom ventilators nearest to them are more or less open, oven during very cold weather. If any diatarbance at the roote is necessary, this in the best sesson of the year for the work, an less foliage is likely to be lost than when the operation is done in the epring. When repotting, carefully pick out all the old crock: and decayed material, and if any roots are clinging to the nides of the pot, ute all the care possible to detach them. At a rule, a number of living root will be found well up the atem, and the base of the stem may be cut off no far, that when the plant is tranaferred to the new pot the lowermost leave will be on a level with the rim. From 2 to 3 inches of large crocks in the bottom of the pot will be afficient drainage. Lay over these a little aphagnum-moss, and then place the roots, bringing them well up to the sarface, and work in amongat them clean picked aphagnam-mon and crocks, at the rate of one-half of each. Fill up to within half an inch of the top, presa it down firmly, and finish off with living sphagnum-moss. After potting, tie each atem in an upright position to a strong neat atake, as any awaying about will cause los of leaves. Any of the large fethy sërial roote that are long enough may be carefully pegged down on the surface of the mons; these will in time root in the moss, and help the plants to grow vigorously. Large healthy specimens, which bave afficient room for further development, will only need to be re-surfaced with living sphagnam; but if there be any suspicion of the monslow down in the pot having become decomposed, it ahould be carefully picked out from between the roots, and replaced with fresh material. Those repotted will require shade, and no water need be afforded for several days, after which give them a thorough saturation. The mos on the surface will soon become dry again, when it should be lightly aprinkled over, and kept growing in this way until each plant has re-eatablished iteelf, when more root-wateringe may be afforded. If the plant are not strong or well rooted, it in best to remove their flower-spikes for one or two seasons, and give them a generous growing treatment. One of the essantial requirements of thir clase of Vanda is a cool moist atage for them to atand upon, and that their immediate surrounding should be kept hamid by ayringing between the pota two or three times a day, which in far more beneficial to the plants than affording large quantities of water to the roote through the compost.

INTERMEDIATE ORCHIDS. - The night are now mach colder, and on two or three occations we have had several degrees of frost, therefore the following Orchid that have been growing in the cool-house daring the past numer should be placed in the cooleat part of the intermediate-houte, where they will get abundance of light and air. Miltonia vezillaria, M. Phalxaopain, M. Wartcewiczii, Dendrobiam Wattianum, D. longicornu, D. infuodibalum, and it va-iety, Jamesianuco, Masdevallia tovarennis, M Schlimi, M. ephippiam, and all thone of the Chimæra section, Lalia harpodhylla, L. monopbylla, Odontoglosaum Kramerii, Oacidiam bifrons, and Cryptophoranthus Dayanus.

\section*{PLANTB UNDER GLABg.}

By W. H. 8 smrth, Gardener, West Deas Park, Chichester, FORCINA-hOUBE.-Where large quantitie of cut flowers are in request throughout the winter and early pring, a proper kind of forcing-house chould alway be available. Failing a proper forcing-bouse, a Melon-house is not an unauitable atracture for thi purpose, if atrong bottom-heat be available. The bed ahould be filled with clean, fresh leaves of the Oak, Beech, or Cheatnut, preferably, and these thould be trodden down evenly and firmly, and when heat has risen, the plants may be plunged, or half-planged, whichever is safer. Take care that violent heasing does not occur. A few Azalea indica may be put in at once. The varieties Deutache Perle, indica alba, and amcoan, will conee on rapidly; also put in a batch of Richardias, Poinsettia pulcherrims, paper-white Narcisasus, Taberosem, Roman Hyacinths, and a few Lilace, of which Charles X. will be found to foree excellently. Shoald the whole of the bouse not be required for forcing purposes, it will be saitable for bringing on plants of Gardenias or Eucharis amazonica which have been rested for a time. These abould be thoroughly cleaned of insects, especially mealy-bag, and planged up to the rim of the pota in the leaf-bed, receiving a thorough watering at the anme time. Keep the plant in the bouse ayringed daily, and afford plenty of moistare on the floors, \&ce.

FRANCOAS. - These are uneful plants for house or conservatory decoration, and as the old plante are now making freah growth, no time shoald be lout in dividing each into about three small ones. A compost consisting of good loam, leaf-ail, and aharp and is excellent for them. After potting the pieces, water them aparingly until well rooted, when more liberal supplies may be afforded. The offeet: which come from the base of the plante, if taken off and inserted in mall pots, and placed under hand-lights in a heated frame, quickly make nice plante. When rooted, they should be repotted and grown on, and they will flower well next sammer. A temperatare of about \(50^{\circ}\) by night to \(55^{\circ}\) by day, will bo quite warm enough during the winter.

InIs RETICULATA FOR EARLY FORCING.-This species hat a very lovely and aweet-scented fower, which may be had quite easily by Chriatmas, if potted in 6-inch pote in lomm, leaf-noil, cowmanare, and sand; when potted, cover the pots with cocoa-nut fibre till an \(\frac{1}{2}\) inch of growth has been made, and the pote are illed with roots. Then place them in a cold frame for a week or two, and tate in to the greenhonse or any house or frame where a temperatare of \(45^{\circ}\) by night to \(55^{\circ}\) by day is maintained. Good varietie are Iris reticalata, I. reticalata major, and I. reticulata Krelagei.
bulbs for early forcina.-Roman Hyacinths will now have commenced to grow, and hould be removed from the plunging material and placed in cold frames, gradually exposing them to the light, and in a few daya a betch may be brought into heat, according to the quantity required. Paper-white Narcisnus and Double Roman Narcinaus will also be ready for removing into cold frames. Snowflake is a great improvement on the old paper-white Narciamu. Some of the bett varieties of early Talips for hard forcing are scarlet, white, yellow, and rose Duc Van Thol, white, acarlet, and yellow Pottebakker, Belle Alliance, Proserpine, and Canary Bird. These should be removed to a cold frame, and be brought into the forcing-pit as required. If early named Hyacinth have made half-an-inch of growth, they hould be removed and subjected to the same treatment as the above, but these mast be brought on more gradually or they will not flower satisfactorilv. Good varietiea for early work are Norma, La Neige, Blanchard, Albertiu, Minn Nightingale, Géneral Lauristan, Baron Van Tayll, Diaraeli, and Delicata.

ERUITB UNDER GLABS.
By Richard Parken, Gardener, Goodwood. Chicherter,
the late vinerieg. -The vinery containing Lady Downe: and other late-keeping Crapes, need close watching, for although the banchee are ripe and properly coloured, gentle artificial warmeh will be very neceasary at night and during dull weather to ensure their keeping without loss. The air in the vinery thould be buoyant and dry, and to that intent no water ahould be uned or spilled in the vinery. The variefy Gro Colmar will continue to attain colorr for some time yet, if a warm brik temperature be kept ap.

PRUNINQ.-Peach and Nectarine treen may now have all the weak shoote, and those not required for bailding up the trees, cat out before the leaves fall, an it can then be better seen which boots aboald te removed. If the trees were disbudded in the epring, a small amount of pruning will now be reyaired, i.e., if only a afficient number of ahoot were retained to furnish the fruiting shoots for the next season. The orject of the grower should be the production of shoot of medium length and of about the thickness of a goose-quill, which, if allowed room for leaf-development, become well matured. When as many aboote are allowed to grow as are produced, there is much loss of strength, and the crop of fruit saffers in coasequence. When praning any tree which han not been properly diabadded, good fruitful shoote should be saved near to the base of each main branch to form the material with which to cover the trellis an these become anfruitful. All weak growths should be hortened, thus strengthening them. It is useless to severely prane any tree which produces great quantities of grons whoote, as thia only aggravaces the evil, such growth seldom ripening afficiently to form flowerbude. Is is far better to examine the roots, by opening out a trench in front of the tree in the uasal manner, and several ffeet distant from the stem, cutting off all strong roots going down deep into the soil, and preserving all mall fibry root moatly foand near the arface. If the noil contains much manare, the trench should be filledin with oldinary garden mould and lime-rubbiah ramming it frmly. This will cause a leas vigorons growth, and bring the tree in a year into a fruitful condition. In order that plenty of aunlight may reach all parta of a tree, the fruiting shoots should not be left cloaer together than 4 incher.

FIG8.-If the shoote were atopped at the point at different times daring the past anmmer, growth will now have ceased, and Figa be viaible at the tipa of the shoote. Thene mut therefore not be ahortened, except in cate of thin and weak thoots. With planted-out trees it may even be necessary to briog up a sucker from the base occanionally, to take the place of or lay-in over old bare branches. [Grafling answers well in auch a case. Ed.]

CHERRIES are generally apurred-in during the growing meason, but all leading shoot should be allowed to extend to the limits of the wall or trellis. Cherrien may be managed accenfally for year withoat the use of the knife. Severe praning often produces gumming and other evils.

PLUMS AND APRICOTS should be managed in much the same manner as Cherries, and in all casea the trees should be so manipalated during the nummer, that bat very little aseles wood will require to be cat out at the present eason, not omitting to keep the bate of the trees furnished with young hoots.

A New Competitor in the Butter MARKET.-Daring the last few years dairymon have affered severely by the increased manufncture of American Creamery, atill cheaper article, and one more calculated to deceive the unwary parchaser, has been discovered in Cocoa-nut butter, which is produced from the oil of the Cocom-nut. It is atated that a company already engaged in manufactuting Cocos-nut butter is sending it out at the rate of 5000 lb . daily, and will in a thort time increase it output to \(10,000 \mathrm{lb}\). per day. "Elaborate preparation," aays the ame paper, "are being made for catering to the foreign and domestic trade, and our dairymen mut uffer thereby. Another nas for the peutral which they make is in the manufacture of filled cheese. It in far superior to lard neutral, and much cheaper, besides harder to detect, sud eanier to emalaify with the skim-milk. Taken altogether, it is a dangeroun competitor, and one to demand imocediate ccusideration."

The Institute of France in ite Relation to Botany and Rorticulture

This week the Institute of Franoe celebrates its centenary, having heen founded-or rather reorganised, for a somewhat similar institution dates from the time of Richelibu-on October 25, 1795. With the general constitation of this assembly, with its history and position at the present day, it is not the parpose of this article to deal. Our intention is to give a short sketch of some of the most famous botanists who have had a share in the history of the Institute, and to see how botany has fared during the Institate's long and somewhat stormy life. The Institute to-day is divided into five sectiona, oalled Aosdemies, and it is with the Académie des Eviences, and enpecially with the eighth section of this body, viz., the botanioal section, that we are chielly ooncerned. In this section there are six members, namely, MM. Naldin, Trecle, Chatin, Ian Tieghem, Bornbt, and Gitignard; while among the ten correspondents of the botanioal section, are to be found the namea of Sir Joseph Hookre, M. N. Pringehrim, Dr. Maxwbll T. Masters, and Dr. Trecre of the botanical garden at Buitenzorg in Java. There are four prizes at the disposal of this section: the Prix Barbier, to be awarded yearly to him who makes the most important discorery in the argieal, medical, or pharmacentical sciences, or in brtany applied to the art of healing; the Prix Desmazierese, warded to the writer of the most useful work on

Mélicocq (awarded every three years) for the best work on the botany of the North of France ; and lastly, the Prix Montagne.

The Academy of Sciences originated in the seventeenth century, in a private society of soientific men, who had for some thirty yeara been aconstomed to meet at various houses. The idea of giving an offioial status to this body was due to Louis XIV. and his Minister Colbert. At the outset the members were divided into two seotions, the mathematicians and the physicists, and under this latter heading were grouped together naturalists, botanists, physiologists, and those men of science whose provinoe was the study of natural philosophy.
At the time of the Revolution, we find that the members of the National Convention had not muoh better ideas as to the classifioation of the sciences than its earlier patrons. They evidently meant to keep a tight hold on the Academy of Soiences, and to assume direct control over the members. They allotted to the same section two sciences so distinct as botany and general physics, and they showed the practioal bent of their minds by giving great prominence to the study of practical agriculture. Whilst the Instituce was annually to choose twenty persons to travel at the expense of the State for the purpose of collecting observations upon farming, it was decided that six would be suffioient to glean, in every part of the world, the facts which related to all other branches of knowledge, including geography. "It is well known that at a period when by the help of the maximum," says a writer on this period of Frenoh history, "the horrors of famice had spread over the whole of France, the Convention adopted a language of hypocritical sensibility, borrowed ohiefly from agricultare and gardening, and whioh would sometimes have led a stranger who entered the chamber of the Committee of Pablio Safety to believe himself transported to happy Aroadia."
In the chronicles of the time we find it written that Robespierre might often be seen walking with a large bouquet of flowers in the garden of the Tuileries, whioh had been planted with Potaton!

Vogetables were then held in great honour, and were introduced everywhere, even into the almanack. Every day of the year had a separate title given it by the National Convention, and these names were as often as not taken from the farm; one was called Carrot, another Cabbage, a third Ass, a fourth Hog. But space will not allow us to linger any longer on this stirring period of French history. Our business is with the botanists and the science to which they devote themselves. It is related that the illustrious botanist, Adanson, a member of the old Aoadeny of Sciences, who endowed soience with many novel and pregnant ideas, was reduced, during the reign of terror, to working by the uncertain glimmer of his soanty fire for want of a lamp. When the Aoademy was refounded and incorporated as a section of the Institute of France, he was summoned to take his p'ace as one of the new members of this body. He replied to this invitation that he was unable to attend for want of a pair of shoes! Napolion extended his patronage to the Institute, though he made its members feel the power of hil sway.
One of the earliest botanists who was a memher of the Académie Royale des Sciences was Jobbph Pitton de Tocranefort, and many of his memoirs are to be found in the proceedings of this body, of which he was elected a member in 1692. Sad to relate, be met his death when on his way to take part in one of the meetings of the academy. Somehow or other his breast
was pressed by the axle of a carriage, and be died in 1708. He is universally acknomledged to have been the greatest botanist of his time, and it was by his skill and oare that the King of France's gardens, almost quite neglected and abandoned before, were afterwards holden in honour, and thought worthy the attention of all the virtuosi in Europe.
Another of its earlier members was A. L df Jussieu, and his brother, Bermard, bale famous in botanical science. It was the younger Jussieu who first attempted to sabstitate a natural division of the whole regetable kiogdan into larger and gradually subordinate gropes, for mare arbitrary enumerations of smaller oos, ordinated groups.
Augustin de Candolle, strange to my, mere was elected a member of the Institute, 胡解 he was oertainly the most distinguished botaith of his age. His son, Alphonse, equally dintinguished, was, however, an associate member of this body.
In recent times, among the more celebuthat botanists have been Brongniart and Mrbbu; whilst Decaisne, Duchartre, and Nadobs, have special olaims upon horticalturists for the extent and importance of their labours in the application of scientifio knowledge to hortiolltare,
The Institute of France does not correspond exactly with any institution in this country, for the Royal Sooiety of London is solely connected with those branches of knowledge usually termed soienoes, and takes no aocount of litera ure, history, archrology, or painting. Besides, the Institute is distinotly a State-aided affir, and each member of the French Aoademy, bat not those of the othern, reocives a small indemnite of \(£ 60\) a year.

In oonclusion a word may be said as to the Comptes Rendus published by the Aodemy of Soiences every week. Here are to be fond brief memoirs of ourrent investigation by the foremost men of soience not only in France, but in other countries. It is to be wished that our Royal Society could see its way to publishing some such weekly record of its meetings, for botanists, no less than other men of soience, mal often regret that the publication of papers in the Royal Society's proceedings takes place so long after the reading of the papers. Society's Jubilee Society, that it is intended to
Celebration. celebrate the fiftieth anniversury
at

National Chryeanthemum Society's Jubiles

We learn from a ciroular insod of the founding of this Society in the month of November next year. From a modest beginning as the Stoke Newington Chrysanthemum Sociefy in 1846 , this energetically-conduoted Society his grown so rapidly of late years that it now possesses hin) enrolled members, pearly on huudred Fellows, and has affiliated to it mocieties than one handred Chrysanthemum Societies In the United Kingdom and the colonite, It has Sir Edwis Saundrrs for its Presidenh Trevor Lawrence, Bart., Sir H. W. Pers, Barl., Sir John D. Llewelyn, Bart., M.P, Thepold de Rothschild, Esi,y, and other influential gentlemen. The Society clains the having materially assisted in promoting the cultivation of the Chrysanthemam all orer tho country; and by awarding good prizes to well. grown plants and fine out blooms, and reoognising hy means of its Certificates, novelties in Chric. anthemume, to hav a hel ped to popularise the flower to no small extent. No one anquainted with the general adrances made in the cultivation of the plant will question the correctanse of this sures

tion. These are among some of its more notable endeavours and aims, and they have been so generally sucoessful amongst amateurs of all grades and gardeners in general, that it is now extremely rare to see a badly cultivated Chrysanthemom plant or ill-developed flowers, both of whioh were oommon enough in gardens twenty-five years ago. Tarning with pardonable pride as oonnoissears to the commercial aspeot of the plant, we could soaroely name acother plant whioh, in recent times, has so greatly benefited the cultivator and the dealer as has the Chrysanthemum, and more espeoially the Japanese varieties. There may not be so muoh "money in it" as there is alleged to be in Orohids, although that assertion seems to be refuted by the numerous small nurseries and florists' establishments which have sprung up everywhere round large towns in which the C'hrysanthemum figures largely amongst the different sabjeots cultivated in them; and it is a fact that cannot be controverted, that the demand for cut flowers of the Japanese varieties has immensely increased in the last few years, the public paying good prioes to the florists for wellfinished blooms of oertain telling shades of colour, or those whioh oome early into the market; so that is a far greater gain all round than the making of two blades of grass grow in the place of one. Good oulture in this case implies also an increased demand for suitable soils, for pots, special manures, suoh as sulphate of ammonia, nitrate of sodi, potash, and others, together with a desire on the part of the cultivator for fuller knowledge in the methods of safely employing these useful artifioial aids to the oultivation of the plants, and eventually to their use on other garden plants.
We may be inolined to deplore the incresse of speoial societies, and wish to see them brought under one general head as regards those existing iu, or of which London is the head-quarters; but seeing the very great ramifications of the National Cbrysanthemam Society, and its very conspicuous virility, it will remain a debateable question with many, if affiliated to the Royal Horticultural Society, its progresa, and its power for usefulness, would have been what they are at the present time.

The following is the official programme. The Jabilee celebration will take the form of :
1. An immense exhibition of Chrysanthemums in Lor don in 1896, in which all typer of the flower will he fully represented, and which will extend over four dayp, with an entire reconatruction of the exhibition on the third day.
2. A grand opening caremony and private view at noon on the firat day.
3. A conference of Chryanthemum growere and raisers from all parts of the world.
4. A Jubilee Binquet at the Hôsel Máropole, and other feative gatheringa.

The atriking of Jabilee Medals of value for competition, and for rewarding anch persons at have rendered conapicuous services in promoting the \({ }^{\text {adivancement, caltivation, and improvement of the }}\) Chryaanthemum.
6. The preparation and pablication of an exhauative Jabilee catalogne of Caryeanthemume, with the most complete clasificatior.

In order to efficiently carry out the Jabilee Celebration, a Special Jabilee Fand has been formed, and it is calculated that the anm of \(£ 10,0\) will be required in order that the Celebration may be accomplished in a manner worthy of the high position occupied by the Suciety.

Sabnoribers of ten gninese will recsive two banquet tickete, and four apecial ticketa to admit to the oponing ceremonial and private riew, god during the threp following dayo,

Sabscribera of five guineas will receive one banquet ticket and two pecial ticket to admit to the opening ceremonial and private view, and during the three following day.

Subscribers of one guinea and upward will receive two tickets to admit to the opening ceremonial and private view, and daring the three following days.

Blue Mountainz, Jamaica (ree Supplementary Illuatration).-The fineat and wildeat acenery in the Weat Indien is to be found in the heart of the Blee Mountains of Jamaica. There are large forente containing Janiper, Cedar, Tacca (Podocarpus) Soapwood and Santa Maria treep, numerous cataract and waterfalls, and a climate a cool and p'easant as early summer in Eogland. In the illustration ia shown a portion of a monntain-torrent in the dry season, with a path above it leading to land cleared for Coffee and Cinchona, or posnibly to the provision grounds of the negroes. In the rainy teason this gorge would be full of raging, rushing water, carrying everything before it. On its alopes are found numerous Ferna, some of them the choicent apecies found in English greephousen. D. M. [The view is taken from a copyright photograph by Mensra. Vallentine \& Sons, Dandee, whose London agente are Menare. E dmann \& Scianz, 4, Salcott Road, Claphom Junction, S.W.]

The Royal Horticultural Society.Tte nest Fruit and Floral Meeting of the Royal Horticultural Society will be held on Tuesday, October 29, in the Drill Hall, Jame Street, Victoria Street, Wentminster. The committee will meet as uanal at 12 o'clock; and at 3 P.m. a lantern-alide lecture on Potatos will be delivered by Mr. A. W. Sotton.

The Promotion of Forebtry in Scotland, - It is atated in the Edinburgh Evening Digpatch. October 18, that the President of the Board of Agriculture is to receive a depatation from the Council of the Royal Scottiah Arboricultural Society in the Scottith Office, Parliament Square, Edinburgh, on Wednenday, October 23, when the view of the society will bs anbmitted upon the following peinta : (1) the advantages of a apparate cffice in Edinburgh under the Agricultural Department, to which an official haviog a particular knowledge of foreatry should be attached; (2) the preaent condition of foreatry in Scotland; (3) the great and increasing importance of forestry in Scotland; (4) the afforentation of wate land in Scotland; (5) the acquisition of a foreat area for experimental and educational parposes ; and (6) the limited facilities for obtaining forestry education in Scotland, as compared with Germany and other countries.

The horticultural Club.-The firat dinner and conversazione for the sesion 1895.96 , took place on Tuenday evening October 15 , and was in every reepect a mont acceasful commencement. The chair was occupied by Mr. Habry J. Veitcie, and there were present the Kign. W. Wilks and J. H. Pemberton, Measrs. Crowley, H. J. Pearion, C. E. Pearsod, J. H. Veitch, H. Turner, O. Thomas (Frogmore), and C. E. Shea. \(A\) very intereating acconnt was given by Mr. C. E. Pearson of a visit recently paid to Lap'and, Nova Zombla, and Kolgoney. The object of the expedition was, in the firat instance, ornithology, but Mr. Pearnon found time to make a goodly collection of botanical specimens, which had been moat carefuily and tastefully mounted by his niece, and were abmitted to the inspection of the members present. He atated that the flora was more alpine than arctic, as may be inferred from the fact that anch alpine geme as Eritrichiam nanam, perhape the crowning gem of alpines, is found in large quantities, as were alro Geatiana rerna, Myosotia alpestrib, Silene acaulif, and many other planta which are fonid in alpine districts ; but, curiously enough, in the whole of their ramblea they never came upon aingle Fern, The curious geological
formation of the country was described, the absence of rock in situ was remarked, as was also the fact that enormous boulders of various formations were to be found in large quantities, which had evidently been carried along by glacier action. The diacussion which followed wat participated in by most of those present, and a hearty vote of thanki was accorded to Mr. Pearson for his most interesting address.

National Robe Society.-At the lat committee meeting, held on the 15 sh inst., it was announced that Mr. Alexander Hill Grap, the diatinguished rosarisn at Beaulien, Newbridge, Bath, had offered a prize of five gaineas for the best esay on the "Hybridisation of Roses." Particulara and term will be thortly announced.

Railway Companies and Agricultural Produce.- Those of our reader who followed the diacassion on railway-rater and market garden produce in theme column in the years 1892, 1893, and 1894, will read with soms interest the following letter which appeared in the Times of October 22: -
"sir,-The Directors of the Great Eastern Railway have just taken a step which may have suoh important results for the agricultural interest that, although the procee lings I am about to refor to were of a semi-private character, I conceive that I commit no breach of oonfidonce in making the pubiic acquainted in your columns with their genoral scope and purpose.
"An invitation was addreseed by Lord Claud Eamiltox to a few leading agriculturiste representing the district served by the Great Erstern Railway, and to myself, to meet the directors and principal officials of the company with a view to ascertaining, in friendly conference, whether it could do anvthing to belp the agricultural interest. At the meeting, which took place to-day, an excellent feeling was shown, as well as an evident desire to arrive at a business-like conclusion, and esveral practical proposals were put forward on bshall of the agricultural interest, which Lord Claun promised, in the name of his colleagues, should receive careful attention.
'But to my mind, the most interesting aod siguificant thing abjut the meeting was that the moment we came to clcse quarters with the question of increased facilities and through rates for the carriage of home produce in bulk, it became, ne obvious to the whole meeting, as it has long been to myself, that a railway company, however willing, cannot extend thesa advantages to individual producers form and until, they on their part combine together to form an aseociation, which will undertake the collection, packing, and regular supply of produce at country dopota, and to whose agonts it can be consigned on arriving at its deatination.
"Some time ago, at the conclusion of the celebrated Southampton case, you were good enough to innert a letter from me on 'The Moral of Preferential Rates,' in which I argued that the solution of that vered question was to be found in an association of home producers,
"We hope to establich such an association very early in the new year. The fact that I brought to the meeting to-day a Written proposal for dealing with this part of the subject practically identical with the views which Lord Clavid Hamin TON, before he had seen it and without previous consultation with me, expressed in his opening speech from the cbair, is, I think, conclasive evidence that we are on the the cbair, is, I justifies me in expreseing a hope are on the right track, and deaire to Britishesing a hope that an your readers who market will support the new aseociation when the time comes. Your obedient servant,
" 6 , Bedford Square, London, W.C., Oct. 20.
Memorial to Robert Brown,-Oa Friday last an intereating oeremony took place at Montrone, when s memorial was uaveiled to Dr. Robt. Brown, the distinguished Scotch botaniat, in a niche in front of the house in which he wae born. The memorisl takes the form of a bronze bust considerably over life aizs, and is the gift of Mina Paton, a kinwoman of Robert Brown. Mr. D. W. Stevenvon, R S.A, it the aculptor. Robert Brown was the son of an Episcopalian clergyman, and was born December 21, 1773. In 1787 he entered at Marinchal College, Aberdeen, where he obtained the Rameay burnary in Philosophy. Two years sfterwards he removed to Efinburgh Uaiversity, where he completed his academical studies. His devotion to botany bore ith firat fruita daring these years in papers on the local flora. In 1795 he obsained the commisaion of ensigu and assiatant-sargeon in the newly-em. bodied Fifeshire Regim nt of Fencible Infentry, and he was atationed with it ia Ireland until 1798 , when he viaited Eagland and made the acquaintance of Sir Joseph Banka, and worked in his library. He returned to hir regimental datier in Ireland in 1799, and relinquished them in December of tho fol.
lowing year, when he was appointed naturalist to Flinders's Expedition to survey the cossts of Auntralia. On thisexpedition he wan absent four yeare, retarning with seme 4000 species of plants, a very large proportion new to science, and many of extraordinary interent as new types of plant structare. Much of this material he clasaified with minute accuracy during the voyage. Oa hil arrival in England, he was appointed librarian to the Linnean Society, abbsequently acceeding Dryander as librarian to Sir Joaeph Banks, and eventually becoming the first keeper of the Dapartment of Botany in the British Maseum on the transference to it of the Banksian collections. His acientific works gained for him a repatation scarcely equalled by'any botaniat before or mince, and he became a member of nearly every acientific society at home and abroad. He died in 1858. Short apeeches were delivered daring the course of the proceedinge by Mr. Carrathera, formerly librarian of the Butanical Department in the British Maseum ; Professor Balfoar of Edinburgh, Professor Bower of Glaggow; Professor Traill of Aberdeen, and Professor Geddes of Edinburgh. representing Scottish Universities; Mr. Marray, Keeper of the Botanical Dapartment of the Britigh Maseum; and Dr. Howden, Preaident of the Montrose Nataral History and Antiquarian Society; all the peakers teatifying to the great work of the greatest of British botanists. Daily Graphic, Saturday, October 19.

Meeting of the Brussels Orchidéenne.The meetings for the season 1895-6 have begun brilliaatly. Fifty fine Occhids were shown at the last meeting, and some of them deserve apecial mention. M. le Comte de Bousies showed Catcleya labiata atrorabene, of a dark purple coloar, hitberto nuknown. M. Van Imehoot nent Miltonia Blanti Labbersiana, with two floral racemen, and flowern of uncommon mize and colouring. M. Madoax staged Cattleya gigan, with a bloom of unusual dimenaions, the divisions pale in shade, lilac tinged with rose, the lip very large, dark purple, eyes bright yellow and very pure white; the habit remarkable. C. maxima marginata, from M. Linden, had a lip with a bright yellow lamel in the centre, the background and veins were violet-parple, and with a broad white margin; Zygopetalum intermedium moortebekense was the happy choice as an exhibit of a new firmthat of MM. Lacien Linden et Cie, who are established on the west side of Brasels, at Moortebeke; the flower of the Zggopetalum is remarkable for the lip, which has a white ground streaked with lilac-parple, with a very effective rose-coloared margin. M. Coppens exhibited Cattleya Warocqueana, the flower wan of excellent form, the petals especially are remarkable in aize. M. Van Imshoot showed Phaius xsmabilit, s hybrid raised by Mesars. J. Veitch \& Sona, which meets with general approval. I would also mention Cymbidium giganteum, from \(\mathbf{M}_{\text {. }}\) Van Imahoot; Vanda corrulea, from M. Flor. Pauwels, and having large flowers; Cattleya aurea, from M. Linden; C. gigas, from M. De Lombaerde ; Lellia elogans, from M. Linden ; and his group of Catclega maxima ; and aleo the hybrid Cypripedium from M. Madoux. A Botanical Certificate was awarded for Cirrhopetalum Medanex, Dendrobiam apecies, Eria specipa, and Bulbophyllum rufinam from M. Linden. Oacidiam ornithorhyncham and O. incurvam, from M. Pauwels ; also Cypripedium conanthum aperbam, from M. le Comte de Bounies, won Certificates for being well-flowered. \(C h\), de \(B\).

National Teatimonial to Mr. A. F. Barron, of Chiswick. -The retirement of Mr. A. F. Barron from the important position of superintendent of the Royal Horticaltural Society's gardens and exhibitions is regarded as a fitting occanion for presenting him with a teatimonial. Mr. Bankor's work in various directions has been of no ordinary character; and during the period of thirtycarried out many important trials Chinwick, he has in plant and fruit cultare ; he bas and experimente on the Vine sud Apple which are utananard treatises
thene fraita; bas officiated as Honorary Secretary of the Royal Gardenera' Orphan Fand, and in a variety of way he havexercised a most beneficent activity in rendering antistance to gardeners and gardening. The committee therefore confidently appeal for subacriptions towardu a fund for presenting Mr. Barron with some tangible mark of gratitude and eateem. In so doing the committee earneatly desire that all gardeners and lovers of their gardens shall have an opportanity, according to their means, of participating in a suitable acknowledgment of the long public services of one of the most worthy and eminent of British gardeners. The names of the committee were publifhed in the advertinement columns in our iseue for October 19.

Cornell University.-Amongot the new inatraction offered in horticalture in Cornell University daring the present year is a seminary upon the literature of horticultare and one upon greenhouse construction and management. These neminaries are really discussions or lymeum, for which all members have prepared themselves in advance. One person acts as leader (as set down in the schedales), bringing in his books and apecimens, whilst the listeners take noter and spontaneonaly discuss the varions points as they arise. These seminaries are wholly informal, and as they are composed entirely of advanced stadents, lively debates may be anticipated. Amongst the stadents enrolled are one or two professors of horticultare, one or two professional gardeners, botanists, and special advanced students in horticalture, some of whom will lead certain meeting*. In addition to the seminary work on greenhouses, there will be other hours devoted to drafting and the making of apecifications. The seminary in the literature of horticultare will have the advantage of Profensor Ballex's library, which is the largest private collection of horticaltural books, and which is probably the richest in American literature of any extant collection.

Sbminary on Literatere of Horticolture. Course 3. F. 11.
1 (Supto 27). The herbals.-Bailey.
2 (Oct. 4). Roman literatare-Lodeman.

5 (Oct. 30). Heating. - Bailey.
6 (Nov. 6). Heating.-Bailey.
7 (Nov. 13). Ventilation.-Lodeman.
8 (Nov. 20). Gleve and glazing.-Blair.
9 (Nov. 27). Stylen of house for varions parposen -Lodeman
10 (Dec. 4). Watering.-Walker
11 (Dec. 11). Pots and soils.- Powell.
The Mildnees of the Seabon.--Mr. J. P. Sheldnn, writing to the Times of October 20 , from the Brand, Sheen, Ashboarne, under date October 19, says :-"As evidence of the abnormal fecundity of the period, I send you, herewith enclosed, bloom of Strawberry, Primose, and Crocas, and aleo a Rone-bud, all gathered this morning in my garden. Some little diatance off, a neighbour of mine has a Laburnum tree with a second crop of bloom upon it; I asw it this week. Probably I coald find farther evidence if I looked for it ; that which I now give came, at it were, quite casually to which Inow give came, at it were, quite casua,
hand. This place is 700 feet above sea-lerol."

Cheshunt, Wormley, and District hop. ticultural Mutual improvement Socery, -The unaal fortnightly meeting of thin Society wes held on Tharaday, October 17, at Tarnford. Mrs W. Harrison presided, and there was a good atterd. ance. Mr. A. J. Simons gave an able lectare on "Cyclamens and Cyclamen Growing," dealing with the origin, description, and varietien, propagation, time of germination, and all points connected mith the caltivation of the plant. An interesting dircuasion followed. A hearty vote of thankg mu accorded to Mr. Simons for his inatructive letron, A farther discassion then took place on the quiving of the most effectual method of eradicating "Meals bag on Vines." This created a good discaution, , mold after the experience of several members had ben given, the meeting terminated. The next metiing will be on Tharsday, November T, when Mr, J. \(\mathbb{K}_{\text {, }}\) Dean will contribate a lecture on "Peara."

Paune Culture in America, - Althungh Americs does not produce sufficient Pranes to meet her own demand, notwithatanding that tho quantities grown are very large, opinions are being circulated in that gooshead country that in a yome or two, with an extention of caltivation, and an average crop, "the local product is likely to eatirely force the foreign article from the markut;" and even further than this, the Americans are begining to think of a futare market for their Psune croph While the conumption of Prunes in the Uaited States is stated to be now as large as \(70,000,000 \mathrm{lt}\), a year, the total product last year amounted to between \(35,000,000\) and \(37,000,000 \mathrm{lb}\). Oregon, Washington, Idalio, and Arizona are all prodnciog Pranes to some extent, and in San Francico large areas of young orchards have yet to come into bearing. Whan all these contribate their quota to the annual outpat, California's gield will be doabled, In view of these factu, it is maid, "The outlook for Prane growern is not very encouraging, anless amo thing can bs done to promote a more general ue of the frait in household in the Eastern Stater. This last remark applies equally to the Britidh consumption of Prunes, which, with adrantage to the consumer, might well be considerably increned

Shirley and Surrounding district garo deners' and Amateurs' Mutual improvement Association.-The monthly meeting was held on the 2 lat inst, at the Parish Rooms, Shirley, Soathsmpton, and as the aubject was an attractive one there was a atrong muster of the membert, the Pre sident being in the chair. The lecture was under be aunpices of the Hants County Council, and theirlece turer, Mr. E. Molyneox, Swanmore Park Gardent, had chosen for his address "An Epitome of Carys. anthemam Caltare," and no one could be fond who has a greater mastery of the sabjecte Every point of interest in the caltare of this popplar flower was brought fully home to the sadience by means of living examples, illustrating the particielar matter ander discuasion, and each little detail was so fally dealt with, that there was at the finish no room for questions or discassion. A beanty vote of thanke was unanimounly accorded to Mr Molynedx, on the proposition of Mr. W. F. Manor, There was a competition for a certicicate for the beft aix blonces of Chrysanthemums, which was amarded to Mr. G. Bushrit, gardener to Mra, Krats, Rownham Park, and there was sleo everal exbibits of frit and various plants.

Publications Received.-From the U. S Department of Agricaltare (Washington Gorant ment Printing Office). Water as a Fator in tha Growth of Plants, by B. T. Gailoway snd ALBBe? F. Woods. - The Grain Smuts: their Cause and Pre sention, by Walier T. Swingle.-Fertilisation of the Soil as affecting the Orange in Health and Divass, by H. J. Wibeer. Alao (Farmerg' Bulletin, No. No Grape Diseases an the Pacifc Coast, by NBmoin B. Pierce. Aloo, from the same Department, Divieinh of Eatomology, Vol. VII., No. 5, of Insect Lith edited by L. O. Howard.

absent a a meparate organ, the flowern were not to lose it beanty altogether, for in nome degree it merged into the petals, one of which we here illustrate (6g. 85). Not only does a patch of the crimeon coloar of the labellam appear in it, bat the wavy edge and more ample mbatance has given the petal a feather-like form, which lends attraction to the flower, sbonmsl though it be.

\section*{ABOUT CHRYSANTHEMUMS.}

Crops of fruit bave been so abundent daring the present season, and the axhibitions, lectures, and gonaip anont fruit calture so general and engroming, that the advent of the Chryaanthemum reign appeara to bave overtaken us with uncommon addenness. In the forthcoming week will be held some of the earliest of the exhibitions, and perhaps antil the e have taken place it would be rash to prophesy
themum in their own parke. In each of thone we have visited in previou seasons, there are again collections of generally well-grown plante now in fall bloom. The only one of the "free" diepleys in London that hae become extinct, it that which for many yeara has been held on the Thames Embankment, in the gardena belonging to the Benchers of the Inner Temple. Before any of the parka made annual diaplaye, the one at the Inner Temple was in exiatence, and the late Mr. Daly and, latterly, Mr. Newton have produced many a good exhibition there. Since, however, the growth of Chspanthemama bas become quite an important part of the duties of the superiatendents at mont of the large parke under the Loadon County Council, the dieplay at the Inner Temple hax nuffered a little by comparison with collections at places where much greater advantage exinted for growing and houting the plant.

Thers in no evidence of lessened interent or enthasiam on the part of those reaponsible for the exhibitiona in the parke. The authorities appear to do what they can to ensure a good show of bloom, and the arrangements made for the control and convenience of visitors, and the staging of the plants show improvement, though in the latter reapect there in room for much more. There appears also to be tendency to copy each other, which reault in a samenean that might otherwise be avoided. In mont case the visitor will find that the authoritie bave considered him a little by erecting notice-boards, which indicate the position in the park where the exhibition is made. To strangera this is more than a convenience-it is a necesaity. Previoualy, the experience of the Gardeners' Chronicle reporter, when trying to discover the Carysanthemamhouse, has not alway been of the happiest nature. As usual, Chryaanthemume, other than Japanese and incurved varieties, are bat indifferently represented at all the places, though we are informed that in one park at least this will be reveraed next aeason.

Finsbury Pare.
Again the Chryannthemums are houned in the long apan-roofed building that was used before the much wider and higher house wan built for the purpose. Apparently the newer house in to be reserved for folinge and other planta. The old house is far from unaitable though; and the collection this year, which is again ataged in the form of a twofaced ridge from end to end, is not one of which Mr. Melville, the superintendent, has any cause for dissatiafaction. Usally there are nearly 4000 plante grown here, but the house will not perfectly sccommodate more than 2000 at one time. The arrangement of the plants indicaten considerable care and taste, although it is the old atyle again repeated. Many new varieties have bten added to the collection, but at present few are worthy of note. Mont of them will flower later. Of older morts we noticed large but poorly-coloured blooms of Chas. Davir, apparently from the crown-bad; J. R. Pearson, a pink or zasuve Japanese ; capital bloom of Avalanche, and the bright-coloured Gloire du Rocher. Though incurved varieties were not fully developed, there were good blooms of M. R. Bahuant, Baron Hirsch, Golden Beverley, and Barbara. G. W. Child was only just opening, bat promise to be good. Hairy Wonder, nearly developed, had poor colour; but, on the other hand, Sunflower was reproaented by first-clase blooms, which combined size and colour too. The diatinct-coloured but well-knowa Edouard Audiguier wan noticed, and bad of the large yellow Philadelphis were fast opening. The excellent large-flowered Anemone Deacartes is a fine addition, and shoald be seen in all collections. Other varieties that mey be mentioned at very com. mendable are Mr. H. Runchman, a flattich bloona of golden jellow, florete slightly recurved, Eyneford White, William Soward, and Florence Davis. Pompons are fairly well represented. The diaplay is only abons five minute wall from Finebury Park Station.

\section*{Victoria Parif.}

Mr. J. W. Mooman, who in a mercber of the Floral Committee of the National Chryanthemom

Society, and has grown the plant for at least thirty years past, has a capital house at Victoria Park in which to display hin Chrysanthemums. The house is a atraight apan-roof, and as Mr. Moorman hat a dialike to atraight lines, the plante are ataged on either side of a central path, the surface of the planta being made as wavy as ponsible. In the house there are staged about 2000 plants; but we were shown an pxcellent reserve batch, which should continue the reason for some time. The arrangement of the plants, with a good band of pompon varietien at front, and foliage plants used aleo at edging, in very astiafactory. The exhibition was opened on the 12 th inato, and will be nearly at its best when theas notes are printed. Gloire du Rocher is al way of good colour here; eeveral of the incurved varieties are also well done by Mr. Large, who hat charge of the plants: Louise has been very fine, but is fast passing; E. Molyneax was represented by excellent blooms; and quite a blaze of yellow is made by that fine yellow decorative variety, Ryecroft Glory. Mrs. F. Jameson also demerve mention, and some good exhibition bloom of Mademoiselle Melanie Fabre, Vice Prenident Calvat, and Mise Dorothy Shea are among the new onee we noticed, bat better blooms of these will be seen later. Vinitors ahould not book to Victoria Park atation, which in some diatance from the house, but 'buse run from the City to the park, and Cambridge Heath Station on the Great Eastern Railway will be found convenient.

\section*{Southwark Parig.}

Spa Road Station on the S. E. Ryo, and South Bermondeey on the L. B \& S. C. Ry, are equally convenient ones for Southwark Park. Batween 3000 and 4000 planta have been grown, and Mr. R. Carle, the muperintendent here, has been obliged to atage them thickly, an no means are arailable to whelter a uccenional batch. The arrangement of the plante is much the anme an lant year, and could hardly be improved mpon in auch a house. At one end varieties of the hirsute, or "whiskered," section have been placed together. Here we noticed good flowers of Hairy Wonder and Louis Boehmer. Eafant de deux Monde, or the white Lonis Boehmer, was not quite in flower, bat King of the Hirautea was making a good ahowwith its long petalled lemon-yellow blooms, This is worthy of recommendation to growert who with to include good varieties of this eection. Souvenir de l'Ami Coye is white, and is less hirate than many of the others, and good blooms are promised by the large buds. Lady of the Lake in pale lilac in colour, and quite good thing; W. A. Mander and Sautel had not opened; and the bade were only partly developed on plants of M. Fernand Bertin, a long-petalled flower, very aparsely hirmate, white, with atripes of rote colour. Among well-grown Japanene varieties worthy of mention were splendid blooms of Elaine, and good ones of Col. W. B. Smith; Wm. Tricker is also well represented, and Madame E. Rey has capital blooms. New ones noticed included Mise Dorothy Shea, which at present is not opening too Kindly; Commendant Blusett, Dake of York, bearing large bude now developing; and Mrn. T. Denne, good deep winecoloured Japanene. Byecroft Glory was conapicuous, and the new Anemone-flowered Dencartes may bs observed. Altogether, the collection is better than last neamon, and there are many fine blooms.

\section*{Battergea Pare.}

The collection of Chryannthemum at Batteruea is ataged in the usal house, a apan-roofed one situate in the frame-yard. It may be useful to visitors if we alvo state that this frame yard is near the went entrance, and close to the Albert Bridge; for the meagreaen of notice-boarde to guide the pilgrim hae reaulted in the writer walking fraitlevaly about for some time, when his knowledge of the park was leas aceurate than it now is. There are about 2500 plants in the collection, and thoy are ntaged in one large bast with path along the eide, an altaration from the arrazgement adopted staged to face a ocatral path, when two bank were staged to fee o gentral path. The wide of the bopee
running along with the path has been nicely furnithed with foliage plants of a more or less ornamental character. The group of Chryasnthemums ituelf would have been more effective had ome efforts been made to acreen the large and thicklyplaced pote by the use of some dwarf Chrysanthemams or other plants. The flowers will soon be at their beat, and a very larga number of varietien may be seen. Mr. Coppin, the superintendent, hat added many of the new sorts, bat few of them were developed when this notice was written. Older varieties that were giving a good account of themselves were Mdlle. Marie Hoste, Mdlle. Thérèse Rey, Florence Davif, Mons. Tarin, Boaquet do Dames, Avalanche, William Tricker, Mone. W. Holmen, Hamlet, President Borel, Gloire da Rocher, and others. The Park is eaaily reached from Clapham Junction, or Battermea Park Station on the London Brighton \& Sjuth Coast Rsilway.

\section*{Waterlow Pare.}

In this little park, at the top of Higbgate Hill, the Chryanthemums are quite as attractive as ever, but poor accommodstion exists here for housing the plants. Mr. Pallett has again filled the conervatory and the three mall lean-to vinerien with very commendable plants, and they are mach earlier than some other collections. For instance, Utopia was eeen in afveral case as small plants bearing three large blooms, which had nearly passed. It is a good deep Japanese flower, pale cream in colour, and petals recurved. Good Gracion had not yet opened, though there were good budr. Wm. Tricker, Wm. Soward, Golden Geo. Glenny, and Edwin Molyneax were all very fine. O d Callingfordii is still flowering in this collection, and Puritan and G. W. Childs were very nice; Alice Bird it a useful yellow decorative variety, and Source d'Or, for the ame purpose, may be uned with advantage. The mall incurved flowering varieties promise to make exceedingly pretty blooma in Mr. Pallett's collection.

\section*{Notices of Books.}

Gardenina a la Mode-Vegetables. By Mre. Do Salis. (Longmans). Gardenina a la Mode-Fruite. By Mra, Do Salim, (Longmans.)
Theseare two little books intended expresaly for the benefit of persona who do their own gardening in a mall way. The writer relates the reault of her own experiences. The cultural directions are moatly clear and good, and the recipes for cooking very appetising. Indeed, we are disposed to think them the best part of the books. The authorens confound the Aubergine with the Egg-plant. They are very clovely allied, but hardly identical. The historical or mythical detaila might well have been omitted. In auch books we do not look to find the opinions on Beans held by Pythagoray, nor the value attribated to Cabbage by Hippocrater. Those to whom such information would be aneful would require exact references, which would necensitate carefal verification. The authoritiel quoted by Mra. Do Salis on parely gardening mattors are not all of the first rank, acircumatance that would make us doubt the validity of her clamical allusions; but, under the circamatsaces, this is of little import. The book: are likely to be uneful to those for whom they are apecially deaigned.

\section*{Special Manures for the Garden.}

One of the most valuable contributions upon the subject of manures for the garden with which we are acquainted, hat juat been inaued by Dr. A. B. Griffitb, F.R.S. (Collingridge, Alderagate Street, E.C.) The work conaiats of 128 pages, overflowing with practical manurial information of the very beat kind. The work is based mainly on the reanlte of the chemical analyses of seventy-two different garden plants, and never before in thin country has such a large namber of garden-plant silh-constituente beez recorded,

In the introduction the author aptly tayn, "O view as to the use of manures has undergone a complete transformation during the patt few jem Scientific research has aucceeded in nolving a number of important problems, and we have consequently been led to adopt new and clear principles relatin to the application of manure to planta. Wo en now in a position to distinguiah between menly ' manaring' and 'manuring rationally.' Wo kom what nutrient the coil mast contain in order \(n\) secure thriving plants and the bent cropa, and that fore we ought no longer to be content with ment manuring, that in to apy, with simply applig fertilisers to soils; but we should manure rationdry, that in, put on the noil those fertilising aubumen which it requires to render it capable of fulaliviog th functions required of it."

It must always be borne in mind that the difiniw plants cultivated require for their growth nolfine quantitie of different, but quite definite, plant fook, and that they take thene chiefly from the roil, If plants are to thrive luxuriantly, these plant-loom mast not only be present in the soil in abuadmo but also in an assimilable form.

It must also be borne in mind that manuigeis alway heavier in gardening (eapecially for vegetably and fruit-growing) than in farming.

In agriculture we have to deal with a compro tively amall namber of different kinds of planem We can easily control this number, and withon mach trouble we can try with each plant wheller the accensory constituents of the manures of com. merce act injuriously on it or not. In horticaltan, on the other hand, this would present far greater difficulties. In this case, we have to deal with a much larger number of pecien and genera, and mo cannot carry out experiment with each of them; moreover, garden plants, various vegetable, thr finer kind of fruity, berries, flowers, \&c., are, sa rule, more delicate and ensitive than field plath Hence it is of the utmont importance that artisciff fertilizer or chemical manures hould be givet lif suitable proportions for different plant, and at given at the mere fancy of the grower. Fiomen, fruitp, and veretablen require manuret, bus the at of manaring garden crops has been practived it i crude and lipshod fashion. Farmyard-manure, domeatic draingge, composts, and occasionally gura, bone-meal, auperphonphate, and potash saltu an used with ridiculous want of diacrimination.

For the benefit of those who are mere tyroe il chemiatry, it may be atated that, when the cheaid burne a plant a greyish-white ash remains. Thit ash contains the whole of the mineral conatituent of the plant; and it teache the nature of ill abstance which the plant absorb from the noll Mignonette contain 38 per cent. of potaib, Beal contain 37 per cent. of phonphoric acid, and Veronicas 36 per cent. of potash, and 30 per cent. 0 phophoric acid in their ashes. Ia other worth Mignonette requires potash, Beans require phor phates, and Veronicat require both potali phosphates.

Bat it should not be forgotten that the miem conatituents of the ashes play a most importanf puth in the natrition and growth of all plants; coulquently, if soil be deficient in the mipor cate atituents, or they aro not in such a form that the can be readily aboorbed by the roots, the plaitian bound to anfler from deficient nutrition. MCD diveares of planta are due to the want of proph mutrition. It has often been atated that monk mathi contain a plentiful supply of the minor zonstituen mid and it is therefore unnecesuary to add theonilen plant-foods to the woil. This the author consian an erroneous idea. Many of the minor conalianti's may be preaent in more than a afficient quat th for a crop's altimate total requirements, yief, ad crop doea not produce a full and profitable jern is often diseased.
In most soils these constituents are present in the form of iasoluble compounds, which af patit partially readered solable daring the lives of pult two and those plant which are termed and and aits quently anffer from thif cause. It is a policy wis
pays the horticultarist to help Natare by adding not ouly auch manures as phouphaten, nitrates, and potasb, bat the minor constituents an well, and in the form of solable compounds. There is little doabt that many plants are miserable failares because the soil is incapable of properly nouriohing them. Soluble manures are readily absorbed by the roots, and they are the principal means of producing healthy, vigorous plants, capable of yielding perfect flowers, iruits, \&c. It is very necesary to remember that the ofject of manuring is to feed the plants, especially during the period of sctive growth. Fractional top-dressings, and the frequent use of amall quantities of manarer, disuolved in water, are the beat ways of applying msnures.
If the calcivator postesses a knowledge of the properties of manares, be anderatand which particular ingredient bould be ased to produce beneficial renults. He, therefore, applie the special manure wanted, and no other. Many aubatances which are munures for certain plants, are not manares at all for otherm; and, in some instances, they may act idjariously. Consequently, the caltivator, be he amateur or profensional, who is ignorant of the proper use of manures, subjecte himaelf to double the labour and expense through atilizing any kind of manure to any aort of crop, irrenpective of the fact that difforent plants vary in their conatitaents, and consequently require farnishing with those ingredients or plant-foods ensential to their proper growth. To use the right manures at the right time, and in anficient quantity, is the correct way to work, and the succesafal cultivator in now required to pay epecial attention to the use of manares.

To become acquainted with the food-requirements of plants, we muat know their constituents. These conetitaents fall ander three divisions. First, there is water, which forms by far the greater part of all plants ; second (which include the third division), the dry or solid matter may be divided into carbonaceone, organic, or combatible matter, and into mineral matter or ash, or incombustible matter.

The combatible ingrediente inclade woody-fibre, atarch, fat, albaminoide, the colouring, flavouring, and odoriferous principles, anch as the green colour (chlorophylı) of leaves, the colours of flowers, and the various ensential oils of flower,, leaves, fruits, \&c.

To illustrate how plants vary in their constituents, we give the following table, being the reault of D) Griffist'a and Mr, R. H. Wilson's analyaes

It will be aeen, by carefully atudying the above figures, that the conatituent of the plants named vary considerably it ie, therefore, neceasary that
the manures applied to the aoil, in order to nourish these plants, muat alno rary.

Concerning these constituonts, it may be remarke 1 that water in derived from the eoil through the roots, that the carbon of the albuminoids, carbohydrater, woody-fibre, and fat is almost ontirely derived from the carbonic acid of the air; that the hydrogen and oxygen of the ame constituente are derived from the water absorbed by the roots; and that the nitrogen of the albuminoid is obtained from the manure used-except Peas, in which case it in partly derived from the noil or manure, and partly from the air, through the agency of certain microbes which are present in the soll.

It may be atated, that the large namber of ahh analyaes, and the different manarial formala given in the work under consideration, are the reants of several yearn' investigation in the garden, field, and laboratory, and we can confidently recommend it to our reader.

\section*{Select extra-Tropical Plants}

Baron Ferd. von Mueller's moat useful treatise on the plants auitable for calture or naturaliation in extra-tropical regions, has now reached ite ninth edition. Ite value in attested by ite reproduclion in India, Garmany, the United States, and France. In fact, within it limitations, it form the most acceanible acconnt of the usefal plant of the world that has yet been published, and an auch is in constant use as work of reference. Baron von Maeller has not contented himself with writing booke, but he hat taken a large ahare in the diatribution and introduction of useful planta. The eatablishment of Eacalypta in various parta of Iadia, California, Algeria, and Southern Farope is largely due to hir zeal and energy. It is to be wiahed that the Baron may be enabled to isac a imilar volume devoted to tropical plants. With the aid of the Kew pablications, thia might readily be accomplished by ao indefatigable a worker as the Baron. It may be thought that euch booke partaking at they do of the nature of compilations, might be entranted for execution to some clerk, but the necessity for trained judgment and knowledge is evident in every page of the present pablication, and freedom from errors could only be ensared by the superintendence of so learned a botaniat as Baron von Maeller.

In addition to the alphabetical lint of apecies, list are given of planta yielding a return in one year, in a few seatont, or not until the lapse of many years-as in the case of timber trees. Catalogues are aleo given of plantn aritable for very cold or for very dry regions ; in fact, the practical requiremente of cultivatore have been carefully atudied throughout. A work like this can never be complete, additions and modification become necessary with the progress of time, and so we find the author already soliciting asnistance in the preparation of yet another edition.

We are conscious that our requent is nomewhat uareanonable, it may be even incapable of falfiment, but the frequent mention of the opinioas and obila dicta of various botanista seems to necessitate faller reference to the place of pablication to enable the reader to see under what circamatances the opinion cited or the fact recorded was given, and the degree of importance to be attached to it, At to the anthoritien for the namen, the Kow Iadex happily enables un easily to find the desired references. To show how much till remains to be done, Baron von Mueller inatancen Mexico. More than three centaries have elapsed aince ite conquest, but "only the mont ceanty information is extant on the timber of that empire, even in reference to it numeroun kinde of splendid Oaks. Again, of aeveral thonannd apecies of tropical graases, not many dozens have been tried as yet with rural or chemical exactitude for pasture purposes, not to apeak of a multitade of prominently utilitarian trees, shrubs and herbs reatricted to temperate mountain regions within the tropics, bat never carried to the lowlands of highor Latitudes."

\section*{The Rosary.}

\section*{BUTTON - HOLE ROSES,}

Althoogi the tate for wearing flowers in batton-holen hat greatly diminished of late years, there are atill a few who keop up the cuatom, castom which, I think, is mach to be admired, even although it is by some carriod to excem. One good effect it had 10 far an the Rowe-garden wat concerned: it led person to continue the culture of a clase of flowers which, although utterly nnexited for the prize atand, were jet beautiful adjuncta to the garden, and this led to prizes being offored at various exhibitione throughoat the country. Bat etill, though the taste for button-holen hat decreased, it is a consolation to know that the ame clase of Rose hat come into general use for what are called shoulder-knote for ladies, so that alew notes on them may not be out of place.

The class of Roses most suited for this purpose is that of the maller Tea-acented, and what are called bybrid Tea-acented Roses, and they mat have two or three characteristica; in the firat place, the bad ought to be more or lem pointed, for it it only in the bud atate they can be used, and hence the Polyantha eection which, at firat aight, weem no well adapted for it, are really anauitable, and are very rarely used. Then they mut have good colour; a white Rose, for instance, would be hardly soitable, and mighs probably angest that the wearer was going to a wedding. There is no Rose which more thoroughly fulfile these necessary coadition than-

Ma Capucine, and although raised by Lavet now a quarter of a ceatury ago, in some repect it is atill not only unsurpased, bat unrivalled; the colour is the deepent in it way of almont anj Rose known, bsing of a rich coppery-orange, recalling in some measure the Austrian Copper and Fortune' Yellow. The bud is pointed, and the petals are very few, and consequently it only remaina good for a ehort time, but when opened is utterly worthleas, turniog to a poor white; it is, unfortunately, not a good grower, and consequently it has remained difficult to obtain. I was rather aurprised to find that my plants of it on a aouth wall, although aomewhat injured by the lat evero winter, recovared and bloomed well this eason; but there can be no doubt that it in of delicate constitation, and requiren a good deal of care.
William Allan Fichardson.-This, as far as conatitation is concerned, is the very opposite of the precediag, being of the most vigorons constitation, and having probably an affiaity to the Gloire de Dijon race; the coloar of the bads, in which atate alone it is of any use, in a rich orange-yellow edged with white, but it is now wo well knowa and popular, that little need be snid in its praise. For table decoration, for moulder-knote, and button-holes, it is oxtensively used, and very often in large establishments, a house is devoted entirely to it. It has one failing, namely, that in certain positions and in certain seasons, the white edging eeem to overpower the orange-yellow ground colour, and the whole flower becomes white, and in this atate it is valueless. It has been said by some, that there are different strains of it, and if so, it white one ought to be avoided; ita freadom of growth and profusencas of blooming will probably tend to make it hold it position for many yenre to come.
L'IUEal is one out of the many productione of M. Nabonnaud, and hat obtained a permanont place in our gardons. It is vigorous in growth, has a good constitation, and is hardy; it colour it is almont imposible to dencribe, affording \(a\) it does a combination of orange-yellow, metallic red, peach, and gold, making it a mont lovely flower, and a general favourite. When exbibited at the Crystal Palace at the National Rone Society exhibition by Mesars. Paul \& Sons, it created a great wensation, and is now recognised as one of the most bematiful of its clase.

Beaute Inconstante.- A new Rowe of novel colonr. It hat been deacribed at terra cotta with flamecoloured ahading, and probably this is an near an we
can get, though it is sometime shaded with cream or white; it aeems, no far as one can ee, to be of a good habit, and very suitable for a pillar or wall.

Gustave Regis - This is naid to be one of the hybrid Tea clast, but I am at a lose to find where the bybsid is in it. All Roses have been more or leat either naturally or artificially crossed, so that the term might be applied to every Rose ; bat by hybrid Tea it is generally intended to indicate a cross between a Tea Rose and a bybrid perpetual, and this I cannot see in this flower-it seems to me a Tea Rose pare and imple. In colour it is a bright canary-yellow, with a very pointed bud; the foliage in good, and the habit of the plant climbing.
Shirley Hibberd.-A comparatively little known but very pretty Rose: was rained twenty yearm ago by Lavet, from Madame Falcot; it is of a bright nankeen colour, with pointed bud, and very sweet. I very rarely see it, and am iadebted to my friend, Mr. Cooling, at Bath, for my knowledge of it.

Princesse de Sagan.-The most highly coloured of the Tea Roses. Ita anopened buds are very pretty to those who admire the rich colours in Teas, which I confens I do not; bat the rich colouring of this variety, which is far brighter than Souvenir de Thérèse Levet or Marie Antoinette, give it favour in the eye of a good many growers.
Madam: Chedane Guinoisseart, \(\boldsymbol{\Lambda}\) very pleasing and free-flowering Rose, faller than some of those already mentioned. In colour it is of a bright yellow, and even when more expanded, \& not unpleasing flower; it is, however, as a button-hole Rose that its chief usofulnes consists.

Adeline Viviand Morel. - A comparatively new Rome, raised by Bernaix ; in colour somewhat in the way of W. A. Richardson, but of prettily combined tinte of apricot, orange, and white-likely to become a general farourite.

Alister Stella Gray.-A new flower, raised by Mr. Alezander Hill Gray, somewhat in the style of W. A. Richardson; a very free and countant bloomer, no that one rarely goes to the plant without being ble to obtain ome flowers from it.
Madame Pierre Cochet.-Another of the W. A. Richardson tyle of Rose, raised by Cochet, in 1892; the raiser calls it an improved (for mo, I suppose, we must interpret "perfection de") W. A. Richardmon. It is a very pleasing variety, of a very vigorous growth and bright foliage, the colour of the flower is very much like that of its parent, not having so mach orange colour, bat more primrose-yellow.

Marquise de Vivens.-A very pretty rou-coloured flower, with a yellow centre; it is very weet-acented, and altogether in it bud atate a very pretty kose. There are probably others that nome might wish to include in this liat of button-hole Roses, bat I do not think that the dozen which I have thus deacribed can be very well exceeded in beanty. They are varied in their colouring, and nearly all very vigorous in habit; many of them partake more of the Noisette than of the Tea character, and indeed occupy the border land batween those two mection. Many of them are now, in Saptember, flowering profusely; indeed, in the late glorious antumn westher there was a wonderful abundance of Tea and Noisette Roves of all kinds. Hybrid Perpetuals were not wanting. although the hot sun very moon deprived them of their bright colouring, which only tend more and more to develop the bearties of the Tea Rose; and those who have not already grown the sort that I have described will, I think, do well to add them to their collection even where the apace is limited. Wild Rose.

\section*{CHRYSANTHEMUM BOULE DOR '95.}

This is a now incurved Japanewe Cbrywanthemum rained by Mons. E. Calvat Thowe who appreciate the five early-flowering Louise, will find this variety a good companion for ame. Bonle d'Or ' 25, , so named to dintinguish it from an earlier variety of that and build, benide-if we may judge from its habit this
caton - which, it flowers open about the ame period. The flower is undoubtedly a very fine one, and generally rather deeper and more compact than sbown by fig. 86, p. 499. In colour it is a lovely light-brown or amber on the urface, with a pale yellow reverse. The variety was awarded a Firstclass Certificste by the National Chryaanthemam Society on October 8, and an Award of Merit by the Royal Horticultaral Society on October 15, the bloom in both cares being exhibited by Mr. W Wells, Earlswood, Redhill, Surrey.

\section*{Home Correspondenoe.}
market bale of fruit.-It does seem at if there was a potent truth in what was recently gaid during a discuasion on froit culture for market, that it was much less difficult to grow fruit than to sel it profitably. If those now growing fruit for market ing, or proposing to embark in that induatry, do not know the best sorts, the best methods of culture and the best manner to prepare fruit for market, then have they greatly wasted their opportunities. The country has been saturated with advice on these matters, and so much bas the subject been ventilated, that even the ablest advocates of reform bave nothing fresh to say, but can only repeat what has previously been stated. Oar fruit exbibitions certainly show that a knowledge of high-clana cultare has apread very generally in the country, and nach being the case, further knowledge is needed to make fruit calture profitable; for unless it can be rendered profitable as a commercial induatry, there is little prospect that auch culture will increase. The first thing to clear upis the reanlts of high-class calture with best varietie as compared with ordinary culture, which is often non-cultare, with ordinary or inferior varieties. If the cry of atarved market retarns comen from the high-class growers, then in the outlook dark indeed. If, on the other hand, they have, convidering the immense crops of this year, been fairly well content, and do not complain, then is it evidant that high-clans fruit pays, and that it is the inferior fruit which fails to do so. It is, however, a matter which the bigh-class fruit grower only can fairly determine. But may not contigaity to a good market, ach as a popular centre afford, have mach to do with profitable result, sasuming that these are sometimes fouad. Thas the grower who ha his ground within ome twenty mile of the market, and can send in his own vans and go himself to sell, saving something of the ordinary cost of railway transit and aseamen's commianion, edjoy: a great advantage over the grower whose laod is beyond the diatance that a waggon can proftably cover, and who has to pay rail charges, cartage at both ends, and alemmen' comminion. Then the grower who is thut in close touch with the market, learns to underatand its requirements and movements, and regalate his sendinge accordingly. The more distant grower know less of the matterm, and does not see much of other methods in the matter of home and foreign prodact. Indeed, it is a fact, that marketing is of itself a vocation for which a certain amount of training is required. Then there generally can be found between the fruit grower, whose land is adjacens to the town and the town hopleeper, an intimate batiness connection, and where that existe, price are alwaya rather better than in the open market, and there are no incidental chargen to meet. If, too, the grower has adopted the more advanced methode of packing fruit in shallow boxes, balkets, \&ce, so an to induce the grocer to become a cuatomer, he opent up a way of trade which eo far bas been chiefly restricted to the foreign importer, whoes methods of packing have beaten our old-fashioned one hollow. I have heard of grower of frait near to London, whose prices bave been low-so low, indeed, as from 1s, to 38 , per bashel for good-nized Apples, according to quality-who have done very well, simply becaue the crop was so heavy. Bat if distant growers of even fairly good ample cannot well locally at a remunerative price, how can they hope to do so in distant markets after paying rail chargen, market fees, and salemmen's commistion? If there be no demand relative to the enormona supply, it in not posible to create it artificially; and although we may deplore the undoubted fact that not more than a third of the fruit is conmomed an food that should be according to the population, and yet it in not ponible in any way to force that consamption, then the most

We can do is to tempt to greater conamation by offering the best of fruit in the moat attractive guise. We have had various aspects of the marty question presented to us from time to time, but they have largely come from the more intereated succasafal side. When we have heard the othe atpect, it bas asually been in the form of a lameat without sny practical suggestions scc mpanying it N ttarally, the misfortunes of the cultirator of
inferior varieties do not command mach attontim inferior varieties do not command much athation
from practical men, bec anae they perceive lath why these misfortunes and failures come. The difie calty presented is to make these growers who en tho bane of fruit cultivation and marketing, realim the weakness of their practic?. If we could elitinath from market competition all inferior frith wo should immensely enhanc the prospect of highe culture. That we are still passing through the transition atage in relation both to caltare ad to marketing methods, there can be no datik The procese is a slow one, bat the altimatemath can hardly be doubtful. Sarely, the fine frnit msented in the best way, mast eventaally wia in th end, End that render in Great Britain, higetem fruit culture assuredly profitable. A. D.

A FINE SPECIMEN OF WISTARIA BINENEI II BURY 8T. EDMUND's. - In writing to the Gandam' Chronicle two or three weeki' since, of especiallf-ine npecimens of this matchlens climber, I had two fing specimens in Bary specially in view, the one at th corner of Sparhawk Street, and the other in Northgate Street, near the railoay station. Tae lattor is considerably the larger of the two, and is one of the finest I have seen, with the excaption of some noble specimen clothing the flower-gurden wall at Euston Park, the eat of His Grees the Dake of Grafton. H. R. Barker, Equ of Northgate Street, kindly sends me the do mensions of his plant, which covars three sider of his large house. Tae plant is 101 feat 4 inchas is length, 23 foet 6 inches high; thas, in romid numbery, covering 2,323 equare foet. The stem, the ground, masaures 3 teet \(10 \frac{1}{2}\) incher, and af 2 feet from the groand it in 2 feet and \(\frac{1}{2}\)-iach ronad, It was this plant that apecially distingaished isell by the profasion and delicacy of ite autuma blonoms this season. The zero frosts of last Febraary did if no harm. D. T. F.

VEGETABLE FOODB AND DRINKS.-Ta phe season will logg be remembered for great hus and drought, and the abundance of Applas Plam. In accordance with the ancient notions aickaes, cholera, and other ills woald be sare to follow, but this does not appear to have been the can. Daring this abondant fruit eason, with whigh a temperature and so mall an amount of raia, it it not racher remarkable that we have been nonanaly bealthy as a nation? I think so. The quatiol arise, is there a cause or reason to account for thin highly atiafactory atate of things? I think then is. Plums at \(\frac{1}{2} d\). per 16 ., and Apples at 3 lb, for 1d. [?] in nearly all large town and citien, at once make it plain that an enormous quantity mult have been partaken of everywhere with excellent phyicel resalts. The question is, have we not gained greasly by all this frat-eating, and if so, what and much? If any of your correspondenta could throm any light on the very important adrantages of eation fruit to make us safer from epidemics if wown be solving a great question indead for our fatu guidance. I have corcainly eaten conniderably than usual, and required as a result less the unal nor have I in the least felt a desire for weather \(I\) kind of drink, and during the hottest weal pur never felt better. In my opision, this more mitir taking of fruit has caused people to feel mors sfared fied-the young in particalar, they haver dial less acately from thirst and the craving of popars and is it not a fact that the free nae or porith drinks dinagreen with many persons. apparently contain ingredienta which rather crease the parched feeling than all persona over-indalge innocently. purtil the eromach can bear the injurion maltar mo longer, and at last throw it off. bot when thins satisfied with fruit there are no chemical anbast to diaggree-on the contrary, an agre pleasing refreshment is taken. Again, good ripe frait the body is atimulated and in in a more nataral manner, and the min of kied cheerfal. I have noticed atewed fruits or other is nerved on nearly every yabr. Maoy pem is becoming more general every year,
would find it dificult to alter their diet: yet the queation is, if we are wise and wish to keep in good healch and fit at all times, whether it would not be adviable to consame more frait and lees meat, and live more in accordance with natoral requiremento, particularly during seasons of high temperature like the pat season. I rejoice to see fruit and vegetables becoming more and more need as food. Henry Cannell, stcanley.

PACKING COMPETITION AT THE CRYBTAL PALACE BHOW. - The arrangementa for the jadging in this very important competition need a little
tunately obliged to market a great deal, had to send every box separate, what a great addition to their labour of packing would be caused, benides greater cost in transit. Frank Harris, Eastnor Castle Gardens, Lediury.

PRICE8 OF APPLE8.- In the able prize earay on fruit reported in the Gardeners' Chroniche. p. 432, the following quotations are given, Eclinville, which headed the list, fetching from \(£ 12\) to \(£ 22\) per ton Lane's Prince Albert, ditto; Goiden Sire, £l5; Worcester Pearmain, from £14 to \(\mathrm{E}^{2} \mathfrak{i}\) per tun; Warner's King, \(£ 16\) per ton; Cox's Pumona, Cox's Ornage Pippin, King of the Pippins. Lord Suffisld,
main £26, that Coz's Orange Pippins, the next beat to the Ribstod, only made fi6 per ton. Can it also be alll trae that, notwithatanding the numbers of Ribeton Pippias grown and shown, and the robast health of the trees generally on Paradiee stocks, Eoglish-grown Ribetona are till so carce as not to have their valne in bulk anseased in ons latect priza-enaye? This is the more eurprising, at we are all agreed that the Ribston remsin till the Qzeen of all our Eoglish or auy other depsert Applev. Neither are prool wanting that it will thrive under good treatment on the Crab or free stock on good coils, with judicions root-praning. I have recently ween some Ribston treen in Susez, over a hundred years

Fig. 86.-cheysanthemom boule dóor '95. (8Rr p. 498.)
reviniod. In the firat place, I think a leading saleaman or two would make very competent jadges, instead of the garcemers who judge in this competition. Then, 1 think, the distance which fruit has to travel should be taken into conaideration; otherwise, an pxbibitor who has to mend a long distance, and very likely over more than one company's lines, is placed at a great diasdvantage a compared with a les distant competitor; and to make aure of the fact, the different samples should travel as ordinary parcela, and bear the company's label to that effect. I myself, with othere who sent wapoples for competition, found our carda marked, "two boxes tied cogother." Ia that a fault? and if 50, why? If all eardeners who, like myself, are unfor-

Pott's Seedling, Tor Enbire Beauty, Stirling Cantle, Tower of Glamis, and Dumelow's Seedling. The etatement as it atande would be more valuable with a little further explanation. It can hardly mean that the lant nine corts named were sold at the \(\begin{aligned} & \text { ame price an Warner' King, viz, } f 16 \text { per ton. }\end{aligned}\) Neither can it mean that ach valuable denert Apple as Cox' Orange Pippin and King of the Pippins are not worth more than much kitchen varieties ns Ecklinville and Lord Suffield. The colour, doubtlew, wells Winter Pearmains, though \(£ 26\) per ton is a bigh price for such a decidedly inferior Apple. And it reem imponible for the able casayist to have withed to convey the impresaion that while Ecklinville made E22, Worcester Pear-
old, in fair health and full bearivg, that had never had suy olher food or manure within the memory of the oldent inhabitant but the drainage of a mall yard, in which about half-a-dozen bullock were "most" fatted every winter ; and we have plent of amples everywhere of the wond orful tenacity with which the Ribaton Pippina cling to life, when not crippled with canker, and mothered with American blight. Query: Are thene weaknemen the astural resalt of our modes of calture, or of our climate or the constitution of the variety? \(D, T . F\).

THE CRAB FOR THE GARDEN AND ON THE TABLE, -I am very glad to aee Mr. Harrison Weir' rousing article about Craba. It would be almost
impossible to read it without setting to work at once to plant Crabi in greater variety. There is no fear of overdoing Crabs in our gardens or landacapes for many years. There are many of them very much overdone with evergreen ; and now is the time, or it will soon be bere, to take out and aproot some of the latter for Cbristmas decorations, and plant Craba in their atead, if no other places can be found for them. For grace, beauty, brilliancy of flower, fruit, foliage, we have nothing to rival, and few to equal, Crabm. Then as aweet on the table, they are ever welcome, as jelly, jam, or whole in byrup, with at leatt a third of the atalk left intact to hold them by. Artista in conserving Crabs vary much in their view of the most orthodox length of the atalk for procuring artiatic effect and convenience. Well, it is not of vital moment, and here the charm of variety may be indulged to the full without idjury to the artistic effect or eating qualitie of aweet Crabs. D T, T. .

CRAB APPLES FOR GARDEN DECORATION. Why ahould not nome of the handsome free-fruiting form: of Pyrus malus, which are denominated Crab Apples, find a place among the ornamental trees in the shrubbery border, where they are but rarely teen? They have two periods of aervice-when they flower, and when they bear fruit. P. malus floribandus is sometimen planted, and is most attractive in apring, being very free-flowering; the young shoots of the previous year asame a naturally pendent growth, and become wreaths of blossom, to be followed by numerous amall fruitw. The red and yellow Siberian Crabs, forms of P. prunifolia, are both highly attractive, both in flower and fruit, the fruit of the former taking on a lively bright reddish tint, the latter pale yellow; both are very free in fruiting, and highly ornamental. Mearry. J. Cheal \& Son, of the Lowfield Narseriet, Crawley, who have a very intereating collection of Crabs, have a distinct form of the Siberian, which, it in probable, originated as a ceedling, and they have named it the Scarlet Siberian, on account of its brilliant colour. In several particulars, it differ from the Red Siberian, not only notably in the colour of its frait, in the absence of the cavity in the eye which is peculiar to the common form, and in the prewence of calyx-megmente, or anuff, which are retained, and do not disappear, as in the cenee of the two typen of the Siberian. John Downie, which taken on a very fine red colour, and in quite diatinct in appearance, may be deacribed an a long form of the Siberian, its brilliant orange-red colour is very attractive, and it fruite very freely. This is a atriking type to plant among shrobs in the form of atandard treen. An extremely handsome form is also found in Tranacendent, from America, which produces ite fruit in large banches, which when ripened in the aun are highly attractive. It is very distinct in character, and the fruit takes on a remarkable bloom. Then there is the black-fruited Crab, which is very dark in the colour of its fruit, and in atriking contrant to some of the others. What is grown at the Lowfield Narserie under the name of edulis is a amall-fruited cort, and valuable as a arabbery plant. Then there is the Dartmouth Crab, the fruit large in aize, and diatinctly plam-coloured, taking on a beautifal bloom; it is alao a free bearer. To suit the requirements of planters, Crabe are "worked" -to use a nursery phrase-both at bushes and standards, the former being best adapted for isolation, anlene the position is better muited for a atandard tree. In either form they make handeome objects; and while a tunny position is probably necenary to cause a fine colour to sppear on the frait, it was yet noticeable at the Lowfield Nurserien that bush plante partly hidden from view by the growth of others about them, and partly by overhanging folinge, yet bore erop of richly-tinted fruit. R. D.

JUDOING AT METROPOLITAN AND LARQE PROVINCIAL HOATICULTURAL EXHIBITIONA. -The anggention made by "P. M." at p. 336, aurely cannot have been made in earneat. The idea is too ridiculoas to be entertained for a moment, and thoroughly unpractical to a degree. "P. M." agggente that an expertsin from the Royal Horticultaral Society-mould be in attendance at all important horticulcaral exbibitions at acrutineer. Scratineer, indeed!-to see that no point of merit in the exhibit are overlooked, and if any error occar, that it may be pointed out before the adjudieators lesve their work. Adding, agenerally mon of notable poaition are melected as judges, and rightly not but sporitions are aelected an mintakes, and acrutineer would materially masist in aveuring justice in each sward." Mark the words,
rightly so, are liable to mistaken," but the suggested expert in infallible, and readers of the Gardeners' Chronicle, eapecially the committeen and wecretarie of large provincial horticultural societien, are anked to accept this highly illogical anggention of "P. M's," which carries its 0 wn condemnation with it, and goes to show the exceedingly high, though deluaive, opinion which "P. M." hat of his ideal expert, and the poor opinion which he entertains of the capacity of men eelected to make the awards. Sapposing that any committee of horticultaral societies were to act apon "P. M.'s" suggention, the judger selected from "notable positions" to make the awards under the condition indicated above would anmuredly not be forthcoming, and the infallible expert woald alone have to"award the prizes. The united judgment of two or more practical men "P. M." thinks might be wrong, and that of one man-the expert-mant neceanarily be right! Why doen not "P. M," boldly say to which high-class provincial show recently held, his remarks apply, and also mention the one absequently held at which the " nonplassed competitor found a peg to hang his 'quibbles' apon, and thereby do that which is right to those judges, exhibitors, and committeemen who have not, in his opinion, trangremed his ideal way of judging. exhibiting, and managing horticultural thows? Fiat ustitia, ruat calum.

\section*{EARLY FIGS IN POTS}

The cultivation of pot-grown Fige ir, I am glad to remark, on the increate in this country, and thome who have eeen the excellent examplen at the Royal Horticultaral Society's Garden* at Chiswick would be able to note the value of the Fig when so grown. My preaent concern if, however, with forced Fige for gathering in March and onwards, which is earlier in the year than the Chiswick Figs bear fruit, and, being early, they cannot be compared with those at regarde fine flavour. Many of the varietien grown at Chiswick are not suitable for hard forcing, though excellent at a later eeason. There is the great advantage in pot Fige that their fruite can be obtained at a time when other choice fruite are not
plentiful; moreover, the forcing is easily managed, and the permanent Fig trees, if any, are kept for later fruiting. When pot-grown Fig trees are forced year by year, they force freely, and bear good crops. It is objected to pot trees that the fruits often drop before mataring, but the ame objaction hold good of the large permanent trees which are hard forced; and my experience it, that there is less dropping with pot-grown Fig treen if the treatment afforded is the proper one. Again, an regard dropping, much depend upon the variety, nome being more liable to it than others, and thene should be avoided, as when the first crop is loat another early crop is out of the quention.

Mr. Barron, in hir excellent report on the Fige at Chiawick a fow yeari ago, gave a lint of aome aixtyaix diatinct varietiev, many of which are not suff. ciently known af yet in gardens for me to adriee their employment as early forcers. The list of varietie which I now give is a short one. An early forcing Fig should be capable of making aturdy, ahort-jointed thoote, so an to fruit freely in a amall apace, and that involven compactness of growth, wo that the forcing can be carried out in low pite or honses. Sach planta are lese subject to fruit dropping than atrong growers. It is surpriving what a nice lot of frait a well-managed plant growing in a 10 or 12 -inch pot will produce if the preparation of the wood has been good, and due upplies of natriment and water have been afforded at the right time, any excenm of either causing badlyflaroured fruit and frait-dropping. The regularlyforced pot trees fruit so readily, that I look upon them as being the mont reliable of early supplies. Daring the laut fow years there have been some valuable additions to early varietiet, viz., St. John's, Pingo de Mel, and Violette Sepor. Many other varietien bear forcing well, but they do not frait in a ohort apace of time; as, take for instance, the firat and ascond named, there is no diffeculty in having ripe fruits in March if the plants are started in the middle of Nowmber, which allown of alow forcing from the
start. Both varieties are noted for good habit, adod oot ehedding the earliest fruite in the dall momon
With regard to these varietien, I have not mic experience with them as permanent trees planted out for summer fruit ng, bat for pot-work they will supersede some of the older varieties for euly forcing, and when of amall aizs. That well knom Fig, Negro Largo, one of the best grown, is not good early forcar, but there is none like it for he antumn cropping, and where apecially grom for fraiting at this season and later it proven a mow valuable Fig; and co variety is more amenabla to pot-cultare. Planted out it yans wild, and ram to fruit unless one is alway pruning its rome these are confined to a amall space. I am C the opinion that the beat nee is made of NegroLare is growing it opecially for late fruiting, although it is a valuable Fig for very early forcing, if given play of apace in which to grow at top. At Syon itime free enough an an early variety, though later outil all that one could wish. The best all-round fir is the favourite Brown Tarkey, a grand pot Iy whose second crop is often better than the frim For growing in a reatricted space and for fruiting from May to September, it is a valuable variot; but it will not tand hard forcing like St. John an Pingo de Me!. The amall white and bleck Ivedim force well, but the white variety is the moredelixions The White Marteille is a well-known ruido, good for permanent trees, or for growing in restricted borders ; and there are some others equally good, by with me none is a reliable an those I have namd The syatem paraned at Syon is to place the pofplanta indoors in Noramber on a mild hot-bed of freah leaven, in low pity, close to the glam, and to force alowly. We obtain from these trees fruita in the month of March. I do not advise the hard forcing of Fige, and if fruit be not wanted sill April, the month of Decomber will be early enough to begit at the crop of fruit will then be better and the frait larger, and of finer quality. A great point with early-forced Fige is the thorough ripening of the wood, and not allowing them to carry late cropt, w they will do if the trees be not lightened of the frila that set. The forced treen here are placed in a cool house after the forcing is over till September, when they are turned out of their pots and denuded of portion of the old roots, repotted, and sheltared from heavy rains, but stood in the open till placed in the forcing-pit. The potting compost conaiste of nond lonm, old mortar or plaster, and bone-meal. A fer Fig cattinge are atruck yearly, and the plants grom on to take the place of those which have to be dis. carded, because too large for the purpose. Darieg their early forcing atages but little mointare at the roots is required; and pinching at the fourth joint in important as growth proceeds, to amiat the fruit il settling. G. Wythes.

\section*{Nubseby Notes.}

CANNAS AT PAUL \& SON'S, CARSRUNT Casna indica of the botanists it now an popular plant in our gardens, and we need not ruia it the leas because it is an old plant. Joha Geand anya, 1596, "that he had planted it in hic gard divern times, but it never cams to flowering; and that it muat be aet or nown in a pot with fine artion or in a bed made of horeedang, in auch manap Cacambers and Musk-Melona are." Parkineon more nuccensful later, and flowered it "in nome timide years," but it never bore seed, nor would it "abila the extremitien of our winterm, unless it meet nit for atove or hothouse mach as aro used is Germany, Is neither house nor cellar will preserve it." Miller's time it bore seed. freely, and he recan mended that the old plants be thrown andy matis they had borne good seedr, at the joung: alway: flowered better then the old roots, neither Miller nor the older botaniate were rer Mith cesaful in improving the plant, for Mr. W. in the Hortue Rewenvis, 1810, onumersber bur rarietien-C. indica rabra, C. i. cocciona, Canm C. i. Iuten, C. glanca, and C. flaccida,
among the easiest exotic planta so cultivate. They are excellent in pota for late autaton and winter caltare, and they are valuable as semi-tropical plante in the flower garden. Crczy, of Ljons, bas beta very aucceanful in raising richly-coloured varietien from seed; and in Eogland, Mearm. Paul \& Son, of the Old Narserit: Cheshant, bave made conaiderable progress in producing a now feathered strain of undonbted merit, which combine a fine dwarf babit in the plants. Mr. Geo. Paul, senior, the genal rosarian, is quite an enthasiast amongat Cennas. O) 10 of the bent varieties is Dr. Maters, the petalf of which are bright jellow, very distinctly feathered with bright red, lip deeply apotted and marked with crimson. Mra. Faudel Phillipa has yellow petal. leathered red, lip yellow, densely apotted red, and is fioe. George Nicholson is a plant of dwarf habit; che flowers are clear yellow, richly faked with crimson, lip deeply potted with the same colour. Miss Elaie Perkins is a lovely clear jellow self; Phcobas is a very pretty orange-red variety, with large flowern. Bacchus is a showy variety, with flowers of large size, deep reddish-criman in colour. Mra. Tasker is an excellent dwarf plant for pot caltare in the epring; the petale are yellow, with buff centre. Amphion, cinnabar red flowers of good form, and a compact apike; Cheshunt Yellow has flowers of diatinct clear yellow, the lip reddishbrown. T. B. Haywood is one of the beet for antumn flowering; the colour is a diatinct deep rosycrimmon. Crozg's varietien, though diatinct from the Caeshant strain, are also of great merit. Papa Crozy is perhaps the best; the dower are of a recdinh-vermilion, and are well-formed. Gloire Lyonnaise is yellow, heavily blotched orangered; Soavenir de Aatoine Crozy, acarlet, with yellow margin, ia very diatinct; Comte de Boachard is yellow, evenly spotted with red, very good and large; Van der Berg is reddith-orange, with clear yellow margin, and very dwarf in habit. Emil Rodeck is a dwarf plant; the flower a clear golden-yellow self, with maroon-red lip. The above are the beat of the Cheshant collection, and they are grown both planted out in the open garden and in pota.
Most gardeners have grown the Canna in pote, and fow plants are better adapted to farnish the greenhouse or connervatory during the nutumn, whilst with a little heat they can be had in flower sll through the winter. The plants may be grown to immense size if they are given good loam and decayed manare to grow ia, and plenty of pot-room. I have had eplendid specimens in 12 and 13 inch pote. The plante also like a light and airy position when making their growth. At Cheshuat smaller pot are used, and quite as good result are obtained in respect to the quality of the flowers. They were also flowering very nicely in the open borders in good deep soil ; in masses of one colour, they would have a fine effect in any garden. I have used them in the form of large specimens with good effect in the centres of large beds which are planted with Pelargoniams and other things. Not only are the flowern of these Cannas richly and brilliantly colonred, but the effect of the foliage at a distance is very atrikiog, and it is eany to obtain colour by using Phloxes, Pentatemons, Antirrhinums, or Pelargonium of the zonal type, J. Douglas.

\section*{Plant Notes.}

\section*{APIOS TUBEROSA}

Tris is a pretty Pea-like, deciduoun climber, which ancceeds in ordinary garden noil, covering a trellia in a short apace of time. When well planted, it will take care of itself.

\section*{Edcomis punctata,}

This uneful plant thould be found in every collection. The bulbe thould be grown in a mixtare of porous aoil in the open, about 1 foot deep, mulching them during the early winter monthe. I prefer to grow the plant in clumps of eight bulbs. Our plants were grand objects when in bloom,

\section*{Clematis Davidiana and C. Graveolens.}

The firnt is a plant of recent introduction, which I can recommend as being hardy, of a diatinct character, erect in habit, and bearing a profuaion of lavender-coloured flowers, quite different from thone of the ordinary tppe of Clematis. It attained a beight of \(3 \frac{1}{2}\) feet this season, and it will doubtless grow taller. It is a auitable plant for a border or rockery, and its hardiness is such that it has stood the teat of last winter unprotected; atill, I mean to take extra care of it for the fatare, as it is well worth it. The bloom begin to appear in the month of Augut, continaing to expand till the end of the following month. Clematingraveoleus is a pretty pale yellowcoloured species, suitable for covering a fence or trellis, and it forms a line effective contrast to C. Jackmani. H. May, Markree Castle, Sligo.

\section*{New Invention.}

\section*{A NEW TURE-CUTTER.}

Is fig. 87 ie presented a new implement for paring or catting tarf for the parpose of laying down lawna, which is likely to effect an immonse economy over hand-labour. The machine has a paring-blade anpported by one vertical catting-blad3, and enares a clean and level cat bottom, and a turve or sod of equal thicknem. A heavy roller rans in front of the blade to level the surface and regulate the thickness

Flif. 8i,- 1 turf-cutiling implemevt.
of the cut. The cutter is furnished with guide-wheels to keep it level, and to ensure the turves being cut to a uniform width of 12 inches. Lifting wheela to raise the implement are provided at each end.

To cross-cat the turves to a aniform length of 3 feet, there in an extra vertical cutting-blede which runs in front of the roller at 4 , and a marker attached to the implement marks a line on the grass parallel to the cut, showing where the cutting-blade is to ran the next bout. The machine has been brought out by Mesarn. Ransomes, Sime, \& Jefferien, Ltd., Orwell Workn, Ipwich.

\section*{SOCIETY。}

\section*{THE UNITED HORTIOULTURAL BENEEIT AND PROVIDENT.}

October 17.-The ninth anniversary dinner of this Society was held at the Cannon Street Hotel on the above date, when Jame Herbert Veitch, Eiq., presided. he being apported by Mesarn. Natting, H. J. Veitcb, A. Moas, W. Y. Baker, H. B. May, H. Catbush, W. Iceton, H. Cannell, and other gentlemen. A larger number than usual were present (110), and the greatent onthuniasm pervaded the meeting.
The Ceairmax, in his after-dinner speech, when proposing the toast of the evening, placed before his audience a most coacise and forcible statement respecting the beaefits offered coacise mambers by the Society. More convincing facts could to its members by the societr. Muore cons from its rules with not possibly be given than the quotations from its rules wan
regard to the many advantages offered. The chairman regard to the many advantages offered. The chainman
announced that the society had now inveoted fund in Trustee's stocks to the amount of \(\mathcal{E 1 0 , 3 0 0}\), the investiments for the past three years baving been at the rate of \(\& 1000\) per annum, whilst this year they will, in all probability, exceed that sum. When the Society came of ago it had only, after twenty-one years of hard work by its secretaries and offcers,
\(1 i i^{2}\) members. A new era then commenced uith these anniversary dinners, the ultimate object of which was to bring the socialy int) more prominent notice. This has been fully justitiod by the prominest and there are now 581 fuly \(u\) ustinid by the remilte, and there are now 881
members scattered over all parts of the United Kingmembers scattered over all parts of the United King.
com, and a few oulside of its boundaries. Then the com, and a few outside of its boundaries. Then tes
invested funds stool at \(£ 36 \overline{3}\), as ogainat the present invenged given above. Then there were twelve honorary members. now there are fifty; the increase, therefore, han bren an allrcund oue. The Chairman alluded to the alterations in the rules, whereby the amount payable in sickness has been increased from July 1 last. This is especially noteworthy, the alteration having, witbout the slightest demur, received the satction of the Hegistrar of Friendly Societies. The increase thus given is from \(10 \mathrm{~s}, 6 \mathrm{~d}\), to 128 , per week for thoee who contribute \(8 d\). per week, and from 16s. to \(j^{6}\) s for thase who pay 9d. Speaking of the Cosvalescent Furit, the Chairman mid:-" Peouliar to this Society, and undoubtedy of great value is the Convalescent Fund, a fued which owo its exintence to the forenight and gesierusity of Mr . Sherwood. Thisfund is purely a voluntary one, and it is at the disposal of the committee. that they may send away for a time any member who may have been so prostrated by illneas as to member who may have been to prostrated by illness as to
render a change essential, but who may not have the necessary render a change essential, but who may not have the necessary
menns. To generous friende and to those who are enjoying a means. To generous friends and to those who are enjoying a
larger share of the good things of this world than falls to many larger share of the good things of this world than falls to many
of us. I would venture to ask something more than a lindly of us, I would venture to ask something more than a Bindyy and Provident Sooiety next comes uppermost in their aninde." Remarls worthy of thought by all gardeners were those made also by the Chairman on thritt: "On the necessity of thrift in general, and the strong advisability of joining such a benefit and provident society as this when young, it would be easy to dwell, and much might be said in particular on the necessity of thri!t for the young men and foremen in the bothies of the large gardens of this country, more especially as the occupation they have chosen bas suffered so much, and is still patfering, through recent jears of depresaion, and through the very large number who are continually entering it ranks. very large number who are continually entering itc ranks.
Travelling lately in various parts of this country, I could not belp being struck by the number of foremen capable in every way of taking head places, and who, even with strong influence to assist them, fail to obtain the much coveted post. Some have been waiting for years, and se apparently ha far off to-day as ever from altaining their wish. To such would I especially recommend the Benefit and Provident Society. The gounger a man juins, the sooner a large deposit is acquired, and the sooner one whll find oneself in the position of certain members will find oneself in the position of certain members
at present, whote interest on their deposit is greater at present, whote interest on their din the amount annually paid in subssriptione." No more weighty arguments than these should be necessary to conweighty arguments than these should be necessary to con, During the evening it was announced that Mra. Sherwood would contribute evj ss, to the Convaleccent Fund sherwood would contribute \(£\) ) 5 . to the Convalescent Fund, a fund largely augmented by the generosity of Mr. and Mra, Harry J. Veitch. on the occasion of their silver wedding, \&i00 being then given Other sums were promised to various purposes, including Mr. A. Moss, \(\mathrm{E}^{2} 2 \mathrm{~s}\) 。 ; Mr. Iceton, who becomes a life member, \(210 \mathrm{10s}\); Mr. Mott, the sum of E 10 l 0 s . Mr. Arthur W. \section*{Law Notes.}

\section*{WRONGFUL DISMISSAL OF A GARDENER AT ILKLEY.}

Heaton v. Courtenay.-Mr.W. Robinson appeared for the plaintiff, Hy. Edward Heaton, gardener, of Ilkley; and Mr. Child represented the defendant, Jaf. W. Coartenay, who resides at Netherwood, Ilkley. The claim was for £4 10s. for wrongfal ditmisal, or in the alternative, four weeke' waget.
This wat a recent case, in which a gardener of experience, who had been employed by Nir Iraac Holden, Mr. Clement Holdaworth, and other gentlemen, was dismianed by his employer with what was practically a fortnight's notice, after baving worked for him about eleven week. The gardener had received a wage of 22 s. per week, with house and coal. He found the garded, and eapecially the Vines, greatly neglected, and in a very bad itate; and on many diay he had worked from 4 or 5 o'clock in the morning till 9 and 10 o'clock at night. He had one man under him, and he had also exira asmintance for a few weeks. On Augut 10 Mr . Courtenay introdaced a jobbing gardener for the parpose of
auperintending the gardener，and under whone order he was to work，and on his remonatrating with his employer，and refuning ae head gardener，to work under another man＇s ordern，he wal forcibly removed from the garden．
This his Honour took to be the cras of the matter． The only question，he said，wan thas an order he was bound to obey．It depend a great deal apon the ponition of the man．If he takes his orders from another man，you place him in a aubordinate position． The defendant＇lawyer contended that Mr．Courtenay had only one head gardener，and that the plaintiff was not the head gardener；and also that he had been given a fortnight＇m notice whereas he demanded a month＇s．Hi Honour holding that he was right about tbat，aaid in conclanion that he was not at all surprised that the plaintiff reaented the order to take his direction from another man who described himself in his evidence an a jobbing gardener，and refused to accept a fortnight＇s notice；and hagave judgment for the amount claimed．Extract from the ＂Wharfedale and Airedale Observer．

\section*{Trade Notice}

- Oncing to the large increase in our circulation, 90 are under the recessity of gaing to press sume hourn eariior. Our contributers wisi kindiy aid us by semding their con mumication us not later than Wiedncsilay.
- Plan for Ice-holse: \(\%\). The plan for a good ice-house must depend upon the lccality for which the particalar one is riquired. If the soil is very porous the well would perbap be best above ground with double walle. The figare given is of one

partially underground, and explaing itself. The dimentions of a good house thould not in any cass bo less than those in this case
Boors: J. D. Fruit Farming for Profit. by G. Bunyard, publithed by F. Banyard, 29. Weak Siruet, Maidatone. Fruit Culture for Small Holdings, by J. Cranston, pablished by Jakeman \& Carver, printert, Herelord. Market Garden Husbandry, by W. Ablett, pablished by Chapman \& Hsil, London.-A. Lefort, Graville St. Honore. The Romarian's Year Books published by Bamrose \&c Sone, 23, O.d Bailey, London, E.C.
Cabnation: \(H\). J. Ross. A monatronity, known as the Wheat-ear Carnation. It is not very ancommen.
Cauliflowers and Broccoli: V. A. G. The meamon for the first has been a most favourable one, and the prodace is finer and better than usual. Broccoli, on the contrary, are still growing, and mould hard weather be experienced, many of the plant will naffer. We should advise the lifting of all exuberant plants and replanting them, their heads inclining to the north. This is readily done b) two men, one of whom should use the spade, and the other handle the plant, and in anch a tender manner that the leaver be not injured in any way.

Corbection - We regret that in the liet of abbacriber to the Testimonial to Mr. A. F. Barron given ia our latt insas, the name of the \(\mathbb{R e v} . W\). Wilks was selled Werks.
1)endrobicms: \(C . S\). It is most likely that the Dendrobium nobile are making growths on the peudo-balbs, in place of flowere, througt the planta not haviog had a afficiently long reat in a cool house. Ot water may have been afforded too soon. Sumetimer, when all other necessary conditions are observer, the plants will grow ra indicated, if the house in which they are kept is not aufficiently \(v \in n\) tilated.
In a French Bran house: Enquirer. Tomator would sacceed with the Beans, but both must be kept free frim weeds.
Libiom eialcedoniccit: W. J. N: The oid bulb froduced two duwer ahoots, which is in excese of what is usual, and when this is the case two bulbs form, and the mother bulb as a consequence becomes ao much weakened that it in not likely to be of any more ute.
Labig Prabs: R. H. B. Twenty-aight ouncen is a good weight for Pitmaston Dachess, but much heavier examples have been seen of Uvedale's St. Germain, Growse Dillon, Chaumontelle, Beurré Diel, and Catillac.
Miss Joliffr Carnations Iying: Thos. Simmonds. The plants are probably infeated with eelworma at the roots. If you will zend a specimen or two we thall be glad to inform you of the cante of their lose.
-• Plants, Frutts, etc., to ar Named.-The applicatrons to name flowers, and especially fruit, ars so numerous at this season as severely to tiax our resowress. They entaul na expenditure of time labour, and money, "f which our
reaters have no idex. We are aluwys willing to nbign our ©rrespondents as far as we c se. but the edzeng of the Gardeners' Chronicl 28 our buiness, to which everything elise must give way. Correapontents are respectru'y requested to observe the ruls that not more than sirs specimens can be dealt with at a time. If more are sent, it woul d bs a grasofnal act on the part of the
senter. to send also a smull contribu, ion to the Gurdeners' senter, to send also a smill contribu, ion to the Gurdeners'
Orphin Fund. Correspondents sending plante or fruits to be named, or asking questions demanding time and research for their solution, must not expect to obtain an answer to their enaitions in the current wank. Srecim ns should be good onps, carefully packed and numbered. Leaves only, or Whoristhe varieties cannot. as a rulto. os namai

Nauss or Plavts: Correspondents not ansooered in this insus are requested to connult the neast numbar:A. R. Phaseolua Caracalla.-A. S. 1, Matricaria
inodora flore-pleno; 2. Pgretbram Parthenium flore-pleno.-E., M.C., Kingstown. Glotba seceiliflora, Bot. Mag.. to \(1428-\) R. M. 1, Maranta Makoyaa: 2, Xingiber ufficinalis (Ginger-plant). You may grow it as an evergreen, or reat it for a time when all the growth are matures, and no more leaven coming.-A. B. The Hlower of Cgpripedium wa crushed. Tnincard-board boxes are of no ase for mending flowers through the pot. If the leave are somewhat like those of C. barbatum it is C. niamente
Nerines : J. D. The Nerines, owing to their bavide been loosely packed, were quite dentrojed. \(S \in n d\) more llowers properly packed.
Udontoglossum craspum: Devoniemais. It is a very unasual vecurrence for a plant of this appciot to produce a flowar-apige from the apex of the bulb, and in your case it is still more extraordinaly seeing that anotber apike in being produced from the base concarrently.
Omission froms the Garuen Directories J. Coomber. The garden not finding a place in these publications, the publiahers will be only too glad to insert it if you will communicase with them.
Oncidiom tigrinum: Devomiensis. Ie is notan utcommon thing for this plant to have two apikes to the buib, but with it, and aifo the Odontoglonam, there is strong evidence thas you get a good now of Aowere from your p!avte, and that in the culture of them you will be pucceseful.
Pebblestone Pippin: Bubernia. We know of no variety of this name. The other queation afext week.
Pleione: R. M. The Ochid is Pleione lagenaria. Ater flowering it should be freely watered until the leaves tarn yellow and fall off next year, when it should be keps dry uatil the llower-bads appear.
Raspberaies: T. P. Very fine fruit for this or any seazod.
Strawberries in Pots now in Bcoon: W. \(H\). \(A\) We thould fear the plante ere ruined for forcing purposen, unless you can put a atop to the flower lag. Do not expose them to the rain, bat place them in frames or in atacke in layers, with balfrotien leavea between the pots. These may stand againat \& wall facing north, or they may atand frep, the plant than, therefore, facing two ways.
Violet Czar: E.A.C. It it late for traneplantiog Violeta into pits or housee ; moreover, the old plants would not bloom so satiafactorily, as least, at any early part of the winter, as young plante which have been suitably prepared for this kind of cultare. A greenhouse is not at suitable plac either, the plants being too far from the glass if planted out, and artiticial heat is iniosical to their well-being. You may cultivate Violets in pote on a greenhouse mbelf. Large ones alauld be employed for them, so to pot up the mother and half-a-dozen of the atrongest ranners, bat this mutt be done in September.

MAN's INGRATITUDE - We have it on shakspeare's sathority, that the winter wind is not more unkind than man'a ingratitude. In many cases this is anfortumately only too trae. Th-re are timen, h) wrever, when
the benefit received is so great thut ingratitule ber possible. When life is rendered a burder to us by siclinese, and someone comes and restores us to health, we should be base to HOLLOWAY'S PILLS and OINTMENT, which have cured them of all atomach and liver troubles, banished headache, flatulency, indigestion, and low spirit, and cleared their
orstems of gout, sheonatiam, sciatica, and anl similar ailments.

\author{
SATURDAY, NOVEMBER 2, 189\%.
}

\section*{T U R V E Y}

PROBABLY only a very few readers of the Gardeners' Chronicle have beard of the delightful village of Turrey. It is one mile from a station on the Midland line between the towns of Bedford and Northampton. Mr intention in to say something of the gardens of Turvey House, but I venture to preface my remarks by a brief sketoh of the village, one of the most pioturesque in England; and yet the greater part of it is not half a century old. The road to the village, about 1 mile and a quarter, is chequered with the shadows of noble trees. On the left, separated from the road by a low stone wall, atretches a beautifally undulating park, studded with Elms, Chestnuts, Walnuts, Uakn, and olumps of Hawthorns. Footpaths cross the park in several directions, and the further side is bounded by belts of woodland. The visitor cannot fall to notice that almost every tree is surrounded by coils of Ivy, some of enormous thicknens, and singularly varied aspeots, which doubtless are doing great iojury to the trees. But the grand old man who lived all his life, with the exception of a few days, at the fine old house known as Tarvey Abbey, the residence of Major Higgins, delighted to see the rugged boles of his trees wreathed about in suoh fantastio fashion with Ivy; and, perhops, the protection thus afforded to birde, both in shelter and food, acoount for the number and variety to be seen and heard in the neighbourhood.

Little of the garden proper can be seen from the high road or the park, but from either, one may get charming views of the old house and its surroundings. Tbere is not much on the north front, except the fine porch and mullioned windows, the mooth and per-feotly-kept lawn and carriage drive; and, level with the top of the balustraded stone wall, a level green plateau of trimmed Box. Box seems to have been a favourite of the old squire's. To brealr the monotony of a range of stabling, a dozen green, olosely-trimmed cones stand sentinel. Perhaps, of all shrubs, the Box lends itself most readily to the topiary art, presenting all the year round a more cheorfal greenery than Laurel or Yew. On the opposite side is a terrace of cottages, standing well back from the road, ech with its cheerfol gardenplot. Here, too, on ench side of a path leading to the oottagen, the great oones of grean Box stand in martial array.

Now, taking a turning to the left, down a narrow lane, we And ourselves in the park itwelf. A noticeboard confronte ut, saying that there is no road, bat that the atrager, nevertheless, may pan; and above this typical yeoman, who is tenent of the park, bide ua "Beware of the bull." It it quite excuable, sening that it is an imaginary bull, and that his sometime scanty grase crope have affered from the wilfol mitchief of visitort of the " Arry
tribe-m "visitors" only, for, \(\boldsymbol{n o}\) far as I am aware, Turvey having no "'Arries."

The views from the park afford a charming bit of Erglish acenery. The fine old gabled houee, with it great windown, porches, and balustraded walls, with here and there a flower-laden urn, atands back some 200 to 300 yards, and is seen through three vistas of tall treen, engirdled with clipped Yew hedges. The extensive lawn, mooth as velvet, is traversed by broad gravel paths; while to right and left these lead beneath the treen in delightfully cool, shady walk. Here is a capital lesson for the landscape gardener, showing how mach may be done by the jadicious planting of flowering shrabs and trees on grans. There is acarcely a glimpse of colour except some vave of Pelargoniums near the windowr, and Rose: and other climbers on the walli. Among the latter we noticed the charming white Clematis montana, one of the most effective of climbers.

The outlook from the south front has a view of the park with its noble trees, its grove of Chestnuts, Elmi, and Walnuta. An architect of excellent taste was the old equire. The sea of greenery in which his old house stands, however, might be greatly beautified and cheered by the addition of the bright colours and fragrance of flowers. There is much to admire as we pasa alcng the village street. Here there is a house covered entirely with Ampelopsis, Roses, and Vines, while every window-sill is gay with bright coloars, and the lawn in front with bed-ding-plants. The visitor will perhaps notice the namber of Walnut trees, and may imagine the scramble of the youngaters, just let loone from school, when the ripe frait patters on the ground, as the equinoctial gales whake the branches. One then fs anes the handsome chool buildings and library. What a relief it would be to see them encircled with flower-beds, and embellished with climbing Roner, Jaminea, Clematis, or eren the hamble Iry. In the courtyard of Turvey House there is a grand old Exmouth Magnolia-why not have one where the villagers could aee it? I knew a school-houme, year: ago, at Harrow, thas encircled and ombellished; the boys, under charge of their teacher, mowed the grasm, trimmed the edgen, weeded the bed and watered the plante. Many a Londoner naused perforce at that garden-gate, to gladden the heart and feast the eye on the flower.
But at last we arrive at the grand old church, with it Yew and rugged Elma. One must not atay, however, to describe its ancient tombs, with thoir recumbent barons, knight and ladies. Village commanities, however, might follow the example set here, of planting Rowes, and putting a border of flowering shrubs round the quiet God'a acre.

A wicket-gate lead us at once into the grounds of Turvey House, a atately intucture of the Grecian order, with terrace garden, rich with colour, In front is a well-wooded park tretching down to the winding Ouse-Cooper'slyrical Oare. The poet, it may beremembered, lived at Olney, about four miles diatant; the house is atanding in which he apent some of his happient years. Turvey House has two eeparate walled gardens, one near the stables, devoted to early vegetables and fruit; the larger one adjoining the house, hat a range of glashoumess, consisting of conwervatory, vinery, and greenhouse. A separate encionre contain the forcing-honmes, pits, and frames. The principal walk is approached from the house by handsome iron gater. On either side of it is a clipped Yew hedge. Between tbis and the wide mooth gravel pathe there existed, antil last eason, a border of flowert, but the roots of the Yew so impoverished the soil that nothing would thrive, and it was laid down in turf. The good old-fashioned cuatom prevails here of aurrounding the bed of vegetablew with border: of Ronen and herbaceous flowers; and smong the latter are large beds of the white Pink, Mra. Sinkin. After the Rones, however, of which there is a capital collection, are the reedling Briars. A mont uneful and graceful plant for cutting is the Aquilegia; Mr. Pullen, the able and experienced head-gardener, has wome capital hybrids from glandulona, chryantha, cansdentia, cobrulea, and others. With s few fronds of Adiantum or some
grassea, Aquilegia makes a light and graceful embellishment to the table, The single-flowered Pyrethram roseum is another favourite; it is of delightful shades of colour. It is succeeded by Cactus and other Dahlian, and then by Astera and Chrysanthemuma. In a mized border in front of the glass atructuren the brightest bits of colour at present come from the Shirley and Iceland Poppies. There is one kind of the latter, as is well known, of a brilliant orange-red, peculiar, so far as I remember, to this flower only.

Mout herbaceoun plants, owing to the long drcught, are stunted and backward in their growth, Dalphiniams and Phloxes eapecially so. Tbe flower garden, and more especially the herbaceous section, sufferm from lack of blue colour; there is nothing, it eeems, of permanence to take the place of the Delphinium and Salvia patens. It is in summer, moreover, that blues are wanting. Just at the time when the cooler tints of the blues are most acceptable, we are sweltered with ssarlets
round its atem some charming alpinen grow, and among them Anemone apennina. Spread ar a delicate filagree of silver and pale green, the feathery variegated Acer Negando added an indercribsbla cbarm. Now it is Guelder Roser and Syringas, with here and there a Clematis or Honeynuckle. Throagh this wilderness of wwet. one may refresh the eys with glimpses of green turf and stately treen, and the silvery ribbon of the Ouse. T. W, \(H_{0}\),

\section*{New or Noteworthy Plants.}

\section*{A HYBRID MUSA.}

A hybrid Musa has flowered thin yeir as Row, which has been raised by Mr, Watson by croning M, Mannii and M. rosacea. As it preaents a deciddedy diatinct type, he proposes to call it Man kemencis. This is, so far an I know, the first inntincee in which the hybrid origin of any apecien of the geaus ha been properly certified, 0 that it is important the

Fig. 89.-mbuit and stone of jubea spectabilie.
A, the fruit ; B, eection of the same; \(\mathbf{C}\), the stone; \(\mathbf{D}\), section of the same. (See p. 518.)
and jellow! Why not utilise the Clematis of the Jackmani type? What a relief it is to rest the eye on grand maseen of Jackmani when the garden is aglow with the fiery tones of colour! By the way, Mr. Pullen haw a Lobelie, of a richer colour, and more telling than the laat-montioned Clematio. It is of deep blue, deep an Salvia patens, and with a clear large white eye. It is a bright and effective edging-plant, and a profuse bloomer. Dame Nature in sparing of her ultramarine. She puts one vivid spot in the throat of the Gentian. Bat aye! I had forgotten that bell of the Gloxinia! which in some inexplicable way has acquired many delightiul hues. Then, again, one can think her nowise niggardly while gazing on those atretches of Hyacinth in the apring woodlands, or the long fringes of Myosotis by the river, or banks of Speedwell on wayside banks.

At a farlong's distance from the wicket by the churchyard, as was anid, one enters this beautiful demene, and then through a ahrubbery by a wind ing walk, finds one way to the garden. But in this thrubbery-it may not be more than a dozen yards in width in mome parta-here and there are little gresn bays in which is a Robinie or a Fir, and
it should be placed on record. It two parents wo nearly allied, both belonging to my section Rhode chlamys, in which the flowers are few in number, the bracts bright coloured, usually red, and the fruity not edible. The following dencription is drum up from two plants that flowered at Ketr, one il June, and the other in October, 1895. Stem eglir drical, 3 feet long, above 1 inch in diameter. Lavel fine, crenated towards the apex of the stem; petiole deeply channeled, 6 to 15 inches long; blade oblong obtuse, 2 to \(2 \frac{1}{2}\) feet long, 6 to 10 inches broad, thin in texture, bright green above, paler green benestith cuneate or rather rounded at the unequal bam Spike ahort, erect, shortly peduncled; bracts oblones 4 to 6 inches loag, criman, with a tinge of man Female flowers in four clueters of three flowers emb ovary finally 1 inch long. Malo flowern also in threet Calyx yellowish, \(1 \frac{1}{2}\) inch long, truncate, and obscurely toothed at the tip. Petal oblong, obture, white, nearly as long as the calyx. Stament five, pro truding beyond the reflexed tip of the calyx; anthers linear, 支 an inch long. A drawing of is hat boo made by Miss Smith for the Kew collection. J. G. Baker, Horbarium, Kew.

\section*{JUBEA SPECTABILIS.}

Tae Coquito Nat or Wine Palm of Chili is one of the mont intereating of sub-tropical Palm. It has a very atout stem which attain a height of from 40 to 60 ft , and beare a large spreading bead of pinnate leaves. The fruit is borse in pendent racomes which look like gigantic bunches of very large Graper. Each fruit (fig. 89, p. 516) contains a single aeed which is nearly round, has a hard brown bony ahell, and the albumen is white, barder than in the Cocoanut and weet to the taste. The stems contain a large quantity of accharine jaice, which, when boiled, become a sort of treacle, and is much esteemed as an article of food, known as Miel de Palma-Palm-honey. A full-sized trunk vields about minety gallons of this sap, to obtain which the trunk are felled, the leaves lopped off, and the juice is canght as it rung from the upper end.

There is some danger that this Palm will soon be extirpated from Chili, through the wholeale felling of the tranks for the Palm-honey. When Darwin vinited Chili in \(18 \dot{2}\), an recorded in his Voyaye of the Beagle, it was very abundant in the country round Valparaiso, he having counted aeveral handred thousand trees on one estate alone. The late Mr. John Ball was there in 1882 , and although he devote a considerable portion of his book (Notes of a Naturalist in South America) to the flors of Chili, he does not even mention the Jabæa. Miss North visited Chili in 1884, and painted a picture of the Jubæa, which is in the Kew collection. "In a place called Salto, one of the mont attractive cosst subarbs of Valparaino, there it a valley fall of the native Palm, Jubsea spectabilin, which uned to cover the country forty years ago, but now acarcely a hundred treen yemain. They are mis-shapen thinge, but seem quite in character with the rocky valley they grow nin" (Recollections of a Happy Life).

According to Siemann, the Jubæs is cultivated in Colombia and other parts of South America. The seedn are sometimes imported into this country, and are known commercially as Monkey's Cocosnut. They are eaten by boym, but I know of no other use to which they are put in this country.

There is a large healthy specimen of this Palm in the temperate-house at Kew. It has a trank \(8 \frac{1}{2}\) feet in circumference at the base, and 7 feet at a diatance of 5 feet from the ground. It beara a grand head of feather-like leaves, each 17 feet long and \(4 \frac{1}{2}\) feet wide, and certainly is not a mis-shapen thing, as dencribed by Mien North. The accompanying figure reprenents a epecimen of the Jubms in the King of Portugal' garden at Lisbon, which was published in the Gardeners' Chronicle in 1882 [and which we now reprodace (fig. 90, p. 517). ED.]. At that time the trunk was 132 feet in circumference. In 1886, thi identical specimen flowered and ripened fraits. It -way then thirty-five years old, and had a trunk over 16 feet high, and 14 feet in circumference at the base. The flowers were produced in January, and the fruit ripened the following August. I believe this is the only recorded instance of this Palm Aowering and fruiting in Europe.

I have seen it thriving in the open air in gardens on the Riviera, a specimen in Mon. Naadin's garden at Antiben having a trank nearly as large as that at Kew, but the leaven were nuch ahorter and lem handsome. [Thir tree, as M. Naudin kindly informed us, when he sent the fruit figured, is 16 feet high, the girth of the trank as a jard high is more than 12 feet, and the age of the tree is thirty-six jears. Ed.j \(I\) believe there is a plant out of doors in the garden of Mr. Smith-Barry at Fota, near Cork, which require only slight protection in winter. A plant was tried in the Bsmboo Garden at Kew two years ago, but it nuccumbed to the firnt severe frost.

\section*{NOTES FROM CAMBRIDGE} BUTANIC GARDENS.
Shoneania montivibuxsis.-There wat a fine group of this plant at one end of the Nymphase-hoase, in Which several of the latter were blooming freely in October. Taese Arrow-head deserve more general cultivation, and this Montevidean apeciea enpecially
would furnish tome valuable material for cutting at this ceason of the year, for though most of the Arrowhead flower in the summer, this fine species was in flower in October. Again, though they love the water and are most at home in a marsh, they will thrive well in loamy soil in pots if freely sapplied with water. The Arrow-heade are almost equally accommodating in regard to temperature. We have averal North American species, and at least one native species, S. agittifolia; and this fine species, S. montevidennis, all of which thrive almost as well in the greenhouse as the stove. Though I have it covered with its atriking white panicles of bloom throughout the winter, the plants will require, as they have at Cambridge, the stimulus of the stove. When water-plants and emi-aquatics get more in demand in our gardens, as well as in vases and glasses in our homes, more Arrow-heads will be grown, alike for their foliage and flower. Mr. Lynch deserves hearty thanks for his atrong and persistent lead in this direction.

\section*{Aristolachia gigas Sturtevanti.}

I do not remember to heve seen thi particalar variety of the giant Dutchman's Pipe before. The magnificent flower in fall bloom at the time of my vinit mast have been 15 inches long and 9 inches broad, with a drooping tail about 2 feet long in addition. Such flowers must be seen to be appreciated, for they are 10 extraordinary as to pass the bounda of a popular description. They aggest, on first aight, an enormous Stapelia or a star-fieh mapended by a stem, and embellished by a tail alike so mall as to be out of all proportion to the apparently masaive solidity, unique colouring and apotting, and extraordinary forms of the flowers. This fine plant seems just at home on a rafter in one of the fine new plantatove recently erected here-one of the handsome groups of glase so admirably linked together by the magnificent corridor into which the whole of the houves open. The plant is blooming with great profusion, and is in the most robust health, though, Mr. Lynch mays, many of the bloom drop off during different stages of their development, a reanlt aurely not to be wondered at as we reflect how much raw material and vital force mat be expended in the formation and finishing of one of these carious blomboms. I have seen some fine amplen of A. gigas and other apecies in aeveral botanic gardens, but never one of auch gigantic dimenaions before; and lovers of the curions in horticulture could hardly do better than eecare and grow this splendid variety. It is grown and bloomed at Cambridge in the highest perfection on the lower side of a by-nomeans long rafter; and though it is looked upon as a summer bloomer, the plant was thickly studded with bads and bloome in all etages of development in the middle of last month. D. T.F.

\section*{HARDY FRUITS AT SUNDORNE CASTLE GARDENS.}

Havisa an opportunity early in last month of calling upon the head-gardener, Mr. Phillipt, I noticed in walking round the garden eme aplendid fruits of Apples. The following varieties were exceptionally good:-Ribstone Pippin, the trees are bearing good cropa of fine clean fruita, good wizo, and the trees comparatively free from canker; a disease that has prevented this variety from being much planted of late years. The fruit of Cox' Orange Pippin are of mediam size, but clean. To get aiza in thin variety the roots of the tree mut be fed with manure at the final swelling period, about the first week in August, with water applied weekly for a time, and only one fruit allowed to swell on each bunch of blossom or frait apur ; the variety would pay well to be highly cultivated, at it is one of the beatflavoured denert Applen. Blenheim Orange Pippin, grown upon a wall tree, was very fine and of good colour. King of the Pippins, Sturmer Pippin, Lord Saffisld, Cellini Pippin, and Stirling Castle, were good. Golden Noble and Lord Derby also good; so was Warner's King, or as there named D. T. Fish. Thene treen, an well an a few othern, were bearing
excellent crops of fruit. The trees are bush-trained, a form so useful for gardens, as they do not thade other crops mach when kept praned annually an there. These trees are top-dressed annaslly with farmyard manure, and otherwise well managed, The bush Pear trees were not atiafactory, and I advised heading them over for grafting next apring, and grafting the following varietien upon them, namely, Doyenné du Comice (the best-flavoured Pear grown), Marie Benoist, Soavenir da Congrès, Beurré Hardy, Magnate, Olivier des Serrea, Daron. dean, Triumphe de Vienne, Clapp's Favourite, Fon. dante d'Antomne, Doyenné d'Alençon. Thew F arieties would, undoubtedly, atrengthen any coilec. tion of Pears, ripening between the month of September and March, and they are found to ancceed as bashes in the open. The following varieties were found to be very eatiafactory, growing againat nouth and west walls, and horizontally trained:-Jargonelle (the crop had been gathered), Williami' Bon Chrétien, Loouise Bonne of Jersey, Marie Lonive (both of these had plendid fruits apon them, clens and handsome), Pitmaston Dachess (the largest Peari in the garden, but only a few fruits), Beurré Supería, Bearré Diel, Winter Nelis (splendıd frait and crop), Bearre Rance and Glou Morceara were good in nizs and crop. The soil in these gardens saems to be well suited for hardy frait culture. The Apricots, Peachen, and Nectarines apon the south walls were in excellent health, and good froit was and had been grown apon them with one exception-Apricots, the crop of which had been poor. Many uaeful young trees had been planted of late jears between the old ones; the latter taken away, as the space was required by the young ones. These promised well for the futare. The following varietien will be found aitable for open walls, south and south-west appects, in the order of ripening in this district:-Peaches: Alerandra, Hale's Early, Gronse Mignonne, Noblesse, and Walburton Admirable. Nectarines: Early Riven, Lord Napier, Pitmaston Orange, Pine-apple, and Elrage. Apricots: Breda, Hemskirk, and Moor Park.

The ordinary varietien of Plams I found doing well, as also Damsons. I learnt that no protection was given to the wall trees last apring against frouts, thereby teatifying that wall fruit, however choice, may be grown on open wall when good cultivation is adopted, as here. I have proved for many years past that front protection to wall-froit treet when in blossom is often a hindrance rather than a help to fraitfalness. The best help I found was in using a board at the top of the wall, 11 inches wide, in the apring months, removing it early is Jane. In this way I wa enabled to get cropn of choice fruit annually for fifteen years in succestion. Many people in Shropahire think that the connty is not auited to the growth of choice fruit againat open walle; auch is, in my opinion, a fallecy. To be succensful, however, there is need for care in the selection of varieties, planting the tret properly, in the autumn, care in pruning in the apring, and of keeping the summer ahoots free from insects - the mont important point of all in the cultivation, early thinning of the fruits when joung and before the stoning period, regulating the number of fruits to each tree according to 280 and wize. Given attention to these matters, choico frait can be grown as well in Shrophire as elsowhere, as proved thin year in a few districts. Robert Smith, F. R. H. S. \(_{0}\), in "Shrewsbury Chronicle"

\section*{Orchid Notes and Gleanimas.}

\section*{ORCHIDS AT ROSSLIYN, STAMFORD HHLL}

That few plante caltivated in the neighbourhood of London thrive so natinfactorily as Orchids when properly tended is a well-known fact, and sn exceslent example in mapport of it in always to Samford in the collection of H. T. Pitt, Esq, at Orchia Hill. Began a few years ago with a fow extended in one of the houset, it has gradually exticises
until at the prenent time, several important rig
of house are entirely devoied to these plants, and admirably do they thrive ander the care of Mr. Aldoas, and the no leas cerefal apervision of Mr . Pitt himself. At the present time, the two most showy plant contribating the largest number of handsome flowern here an in most other collections, are the varieties of Dendrobiam Phalxnopais Schroderianam and of Cattleye labiata, which may be regarded as two of the most useful planta ever introduced to garden. Both are free-growing and profuse-flowering, and seem to adapt themselven to almot any quarters. The D. Phalænopsis have been flowering here for months, but atill they are embellished with gracefal aprays of bloom; and with them in flower are D. P. Statterimnum, D. Hildebrandii, and other apecies.
In the adjoining honse, mpended over a bed of fraiting Pines, and taking full sanshine at all neanons, is a fae batch of varietien of Lalia anceps, so thickly set with flower-piken that more could acarcely be got from plant of their aize. Taking one 12 -inch baket at an example, we counted on it twenty-seven Hower-spiket, which on maturing their flowers will give a specimen of extraordinary

\section*{Cattleta lablata.}

Amongat the mumerous kinde of Orchids which have been 10 plentifally imported daring the part fow years, I am of opiaion that, taking all points into convideration, the above-msmed Cattleya is decidedly the most meeful. It natural period of flowering daring the month of October and November, when choice flowering-plante are not at all plentiful, is a very atrong point in it favour. It is also what may be termed a general gardener' plant, seeing that anyone with atove mny, with ordinary caltare, have it in perfection. In thit renpect it may be compared to Dendrobium nobile. I know of plante which have been in the posesaion of their owner nearly forty years, grown ander the condition named above. Une more intereating point in it favorr il the wonderful variety of form there are in, eay, a dozen plants. Inew ten distinct varieties in that number of plante the other day; and they had been "aut parchased in bad at anflowered plante from the nureery. The price, too, at which good plants can be purchased is quite moderate. For the decoration of the dincer. table or other indoor parpone they are iovaluable ne cat-bloome at
placen. This year the crop is a plentiful ove, iut pricee are not so high ase one might wish; atill, good fruit alway fond a ready sale, and fetchet fair prices. In almont every direction mere encumberern of the ground are to be met with, the produce of which is in many inatancen of a rubbiahy deveription, and yet these treen are allowed to remain from year to year. All this might be altered by plantiag healthy, soand joung trees in new situations, which. if carefally plauted and consiat of aitable varieties, soon begin to come into bearing, and the fruit is of good aize, colour, and general quality leaving nothing to be denired. If we are to keep pace with the timen, which mean supplying our own country people with good wound fruit, and thereby rendering the import of fruit mucb leas profitable to the foreigner and colonial, more trees mat be plated, and trees in pood bearing kept in frst-rate fraiting condition by anmal top-dressinge and carefal pruning. Any kind of eill that is capable of producing other good crope, anch an corn and regetables, is aitable for \(\mathbf{A}\) pple cultare. The easential thing to be aimed at in good drainage and a fair depth of soil, alco a suitable site.

Trenching land for newly-planted orcharde entaila a great deal of laborious work, and in not very necennary-at least, not in all parts; but there should be no lack of care in the due preparation of each tree atation. On large plote of pastare lend, if the trees are to stand at not lese than 40 feet apart, bole ahould be dug oat and prepared fally 7 or 8 feet in diameter, and well broken ap to a depth of ن̈t feet, and for several yeara after planting the grace ahould not be allowed to grow on the ail over the roote, and e mulching of well-rotted manare applied, which will be found of great benefit to the trees in promoting a free growth.

It in very seldom, after trees have been well planted on a tomewhat firm eoil, and where apace co grow in practically anlimited, that root-pruning in required, as with a fair proportion of branch extension, and a moderate use of the knife, the trees quickly come into good bearing. It is of far the batter method to let the crown become well developed before allowiag the trees to bear fruit in any quantity; for if once they are rondered atunted in growth through heen early cropping, it is many yeare before the trees recover their former healthigeas and vigour.
When in firct-rate condition, young Apple trees planted in lines at a good distance apart, and allowed to make a fair proportion of wood, produce cropa which far outweigh both in si \(\angle \theta\), quality, and bulk, that produced by trees crowded together. Probably the bent course to adopt, if fresh ground cannot be obtained, and the best muat be made of the old Apple-sick soll, in to mark out the places for each tree to be planted, aroiding, if posnible, spots on which trees have stood, digging out the old soil to a depth of frem 2 to 3 feet, and breaking up the maboil. The hole abould not be lese than 8 feet in diameter, and it is good practice to leave them open for several week. This will allow the frost to palverise the ntiffer ubsoil gually found in old orchardi. Advantage should be taken of frosty weather to get as much freah acil and road-paringe carted to the spots as may be required, planting the trees at any zild time Juring Febrary and March. Good varieties are numerous enough, and the goodness of Apples seems now to be more looked to by connamere than was the case formerly; but, anfortanusely, the yield of come favourite varfectien it not very abandaut. A good early kitchen Apple is fousd in Lord Darby; the tree growe strong, and it is one of the beet for general early cropping, the frait of capital nize. In my locality it is conaidarably better than Lord Suffield. Yorkahire Beauty is another variety that rarely failu to bear; in fact, we have no kind so tratworthy in that respect. Waltham Abbey Seedling is a largo clear yellow Apple, and very unefal an a kitchen cooking frait, and the tree is hardy, and not liable to canker. Stone's, New Hawthornden, Bramley's Seedling, Annie Elizabeth, all frait well. Tower of Glamis, Ecklinville Seedling, Golden Spire, Golden Noble,

Daux Ans, and Lady Henniker are all good market fruite; also Wellington, Gooneberry-Apple (not Pippin, the two being quite diatinct), and Northern Greening are excellent for late une. There are many other good calinary varieties, but I find those mentioned are very aitable hereaboute. Demert varieties consist of Cox's Orange, Kerry, Ribaton 'Pippins, and King of the Pippins; this year the latter hat grown out very fine and clear-all points considered, this Apple is atill one of the best. Blenheim, either for dessert or cooking, is probably the beat all-round Apple grown, and fall-nized trees fruit abundantily; this laat alway sells readily at good prices. Worcester Pearmain, although not of tirnt-rite quality, puts on a high colour, and comes into use at a time when Apples of the best quality are anfit. The tree bears well, and it is a variety well worth growing.
Claygate' Pearmain is of fine quality; Cornish Gilliflower, although not a pretty-nhaped fruit and fruiter, is certainly, in my opinion, one of the first quelity; \$turmer Pippin is one of the bent late destert varieties if the fruits are allowed to hang on the trees till very late in the year; Yellow Ingestre in amall and usefal, and it is donbtful if there is a raore profitable Apple grown from a market point of view. Mabbott's Pearmain, Brownlee'a Rasset, and Chiville Rouge Précoee are all good.

\section*{Prinigg Stakdard Trebs.}

This'is usually done after the leaves are down, but it may' asfely be performed at any time after the fruite are igathered, as by removing some of the old limbe early, and before the leaves fall, decaying branches are better neen; keeping the tops moderately thin is the mont important item, but if the heade are lept too epen and the branches far apart, they are more apt to way during high winds when heavily cropped, and the froita get damaged-so that nome judg--ment in required, and the habit of the variety atudied in branch thiming. The finest lot of Blenhsim Orange Pippins I ever naw were growing in a large fruit'garden thin year, where it wan evident that the praningisaw is not spared, the long limbs being comphetely loaded with fraits from top to bottom, and fortanately no rough high winds were experienced this season to bring down the crop and braise those that remained on the trees. H. Markham, Mereworth Caste, Maidstone.

\section*{The Bulb Garden.}

\section*{IRIS K KMPFERI.}

Tiel rarity of these beautiful Japanese Iris in private gardens is scarcely to be accounted for, unlens it be thought that a pond or atream or lake are absolutely needed for their acceafal cultivation. It is almoat impossible to realise the beanty of a fine group of the hardy flowers, and were they grown in proportion to their merit, they woald certainly be aeen in abundance in all private gardens. Even in auch garden in which the plants may be found, it is rarely that a fall measure of succens is obtained. That they sre moisture-loving plante is not questioned, but this does not mean that they will enceeed -in or near to magnant water. I have, indeed, grown thend better in richly-manured ground in the neigh-- bourhood of Hampton than others have at the water's edge. Moisture is necessary, and so is an open vegetable soil, or a soil largely consiating of leas-ail and peat, with a good quantity of decared manare. Any amatear who feels so inclined may grow thene delightful sabject in the most satirfactory manner by adopting the following simple méans:-in gardens with a heavy retentive aoil, a apecial bed should be made by digging out the soil to the depth of 2 feet, and in the form of an oral, oblong, or other desirable figare, and replacing it with rough peat, half-decayed leaf-mould, and very short manure, the firtit two in equal ratio, and the manure about one-fourth, to which may be added mbout one-fourth of the itaple, making at the least a bed \(1 \frac{1}{2}\) or 2 feet deep. It should be well mixed togother, and loft in
a comparatively loose atate. In finishing off the bed, allow the aurface to be 3 or 4 incher lower than the surrounding level of the soil, so that it can be deluged with water in dry weather in the growing season. In gardens where the soil is strong, and the subsoil is gravelly or andy, a similar excavation will be needed; but in this cane I would advise lining the bottom with clayey soil, so an to retain the moistare. What these delight in is an unlimited anpply of vegetable mould below, and plenty of moisture afforded from April to September. What they dinlike is atagnant moistare throughout the winter, which mast be avoided if saccess is to be insured; and they are afer, and stand better chances of flowering. in any ordinary damp, shady border; bat where abandance of vegetable soil can be afforded the roots, a marked difference will soon be observed. If only a dozen plants be obtained, they well repay proper care. This Iris is by no means fartidions as to the reason to plant; but preference ahould be given to the autumn, as this enables them to make fresh roots by the time growth commences in the spring. \(J\).

\section*{The Week's Work.}

\section*{FRUITS UNDER GLASS.}

By Richard Parker, Gardener, Goodwood. Chichester.
PREPARING FOR FORCING.-The houses or pits in which the earliest forcing will be done hould now be got in readiness by cleaning the wood-work and glase, and lime-washing the walls. If a mall quantity of petroleam be used in the lime-wash, it will prove a good kind of insecticide. When the work of house-cleaning is thoroughly done at thin season, much labour in cleaning the plants later is avoided. A large heap of atable-litter and Oak or Beech leave should be prepared in some theltered corner where the wind will not reach it, and be well mixed and turned over several timer, so as to fit it for bringing into the pineries, \&c., at may be required. It forms an admirable mild hotbed for hastening the flowering of plants, and adding warmeth to the house. A compost consisting of fresh tarfy loan, crashed bones, wood-ashem, and old mortarrubble or planter, should also be prepared, and placed ander cover, in readiness for top-drenaing рагровен.

8TRAWBERRIES IN POT8, ETC.-Sharp fronts having net in, the plants in pote ahould forthwith be placed in winter quarter as previously advised. Ae bad drainage is more injurioas to the Strawberry than front, no water ahould be allowed to collect about the pots. I do not advocate placing the plants on their aiden ander walle, \&cc., as thesoil is apt to become too dry, causing the roots and crown to lowe their plumpness. Frames and pits form a better shelter if the pote can be plunged closelytagetber ap to their rims in beds of fine coal-asbes or tree leaves. The frames ahould have a southerly aspect by preference. Foliage which has become brown should beretained, as it forms a protection for the crowns. As was before atated, those plants which are to be forced early should be plunged in lesves, \&c., in pite, and the lights should be only placed on them during frosty weather. All kind of fruit trees in pots hould by this time be planged in beds of coal-ashes, or have their roote protected in some other manner from frost.

THE OTHER FRUIT- HOUBEs.- Continue to freely ventilate all the Peach-houses and vinerien, excepting those containing Grapes, care being, of course, taken to prevent the water in the heating-apparatue, from being frozan.

PINE-APPLE8,-Qaeen Piner, to ripen in May and onwards, should now have the amount of water afforded at the roots somewhat redaced, a slightly lower temperature maintained, as well as a drier atmosphere, and thas affurd the plants a two months' rest, which is eapecially desirable if the plante are to show fruit at a given time. The pinery may be carefully ventilated for a few hours daily during mild weather, when the inaide temperatare has risen to mare than \(68^{\circ}\). The night temperature hould not exceed \(65^{\circ}\), and the bottom-heat should be steady from \(70^{\circ}\). It is very denirable to cover Pine-stoves at night, especially in frosty weather, the retention of the denired degree of heat by this means boing preferable to the excennive use of the hotwater pipes. Thick blinds answer the purpone very
eatisfactorily, although Frigi Domo and mats are alvo of fus. In the fruiting-house, a brisk moint heat should be kept up, to encourage the swelling of the fruit, and no overbead syringing be performed daring the winter montha, but the sarface of the pluaging material moistened instead, by syringing it alighty between the planta aboat \(9 \Delta \mathrm{M}\). and 2 gm Very little ventilation should be afforded, unlens the an be very warm, as draught of cold air are injarious. A day temperature of \(70^{\circ}\) to \(75^{\circ}\) in this division, and one at night of about \(68^{\circ}\), should be maintained. The rooted Pine suckers should be afforded much the same kind of treatment an that recommended for the \(Q\) reen Pine plants antil the tarn of the jear, and by keeping the planging material well up to the rim of the pote, and keeping this in a fair!'y moist condition. less water will be required at the roota, If each department see that there are no drips from the roof, as water falling conatantly into the pots aourn the soil, and caunes the roots to decay. Ripe fruit ahould not be allowed to remain in the store, \(m\) it keepe much better in a dry room.

\section*{PLANT8 UNDER GLAB8.}

By W. H. Smitr, Gardener, West Dean Park, Chichutr.
TUBEROU8-ROOTED BEGONIAB.-There plath will, in most gardenm, be past their best, and whonld be gradually dried off, for which parpose the poss containing them may be placed beneath the greenhouse stage. When they are completelv died down, shake all of the old soil from them, and keep them in the winter in shallow boxes filled with cocos-nat fibte refuse, placed in a dry place, from which frost in excladed. All doable-flowered and unusaally fine aingle-flowered varieties should be in sume was designated, in case it should be desirable to propagate from them next spring. If cuttings of double-flowered varieties were atruck at the time advised in a previous calendar, the plants ahoald be kept actively growing for some time longer, in order to obtain a large a tuber as pomible. For this parpose a mild hotbed-frame, and the plants placedelow to the glasp, will suit them admirably. All flowern should be picked off these young plant as futs they appear on them.

ACHIMENE8.-The latent batch of the se fuberout rooted tove plants may be gradually dried off, and then placed beneath the greenhouse stage or in the potting-shed if it in fromt-proof. Those grown in basketia may be ahaken out and placed in boxes of dry peaty ooil or ailver and, and similarly tored. Achimenes should not be kept in too dry a place, a the tubera are then liable to ahrivel.

DEUTZIA GRACILIB.-PIants which have groml in pota all the summer may now be examined as to the drainage of the pota, and removed to cold frames, in readiness for being forced, and placed close together if frame accommodation be limitedo The plants will require little or no water until they are taken into the forcing-house. Taose planted out ahould be lifted and potted up, these latter being taken last into the forcing-house, as the pot-grow plants atand hard forcing better than they.

HINTS ON SEASONABLE OPERATIONE,-NO time hould now be lost in getting all plants whith have been atanding outside into the greenhoutef, conservatory, cold frames, or brick-pite, althong such species an Moutan (Tree) Pæonies, Hydrangea, Campanulas, Fuchsias, Richardias, Carnations, Ags. panthus, \&c., are able to atand a little front. The Hybrid Perpetasl Rones for forcing parposes, if no room be available in pita and framen, or the Rove honse, should be plunged in beds of cocosnute the or fif
rim. rime.

VIOLETS IN FRAMES should have regalar attaintion in airing, keeping free from weeds and rannerk, and in watering and protecting from frost. At istered place, on October 26, the thermometer regish mats \(10^{\circ}\) of frost, and the protection of the frames with the was very necesaary. Air should be admitted to the frames as soon as the rime is off the glas.

THis OACEID HOUSD8.
By W. H. W mixis, Orehid Grower, Burforl, Dorkiyg.
habenarlas.- The apecies, Habenaria militarit, H. rhodochila, H. Saaannæ, H. carnea, and ion their white variety nivosa, are well worthy of attention, sime flower- pikes prementing a gay appearance at aners in when there is a comparative absence of for that the Oschid-housen. Where convenience for the to culture existe, they are plants which denerv
be well represented. Now that their requirement are better understood than formerly, but little difficalty is experienced in the management of them. At the present time a large number are in bloom at Barford, and already the leaves of the earliet-flowering apecies are beginning to how diacoloration; water mat be therefore gradually withheld from them so as to induce the dying down of the stems and foliage. The stem should not be cut off when decaying, bat left to fall natarally away. It is not advisable to withhold water altogether when growth ceases, an over-drynest at the root causes the tubers to ahrivel, and it is doabtful if they ever regain their plump condition; and they invariably start weakly the following apring. The plants should be kept intact in their pots, and be carefully examined once a week. Those which are found to be dust-dry should be stood by themelven and afforded a good aprickling of water from a fine rose watering-can. Habenaria militaria, H. carnea, and H. c. nivosa, should be rested on a shelf near the glass in the warm-house alongaide the deciduous Calanthen ; while H. Sasancæ and H. rhodochila should occupy a mimilar position in the Cattleyahoune.

DENDROBIUM PHALAENOP8IS.-Many collectiode are now gay with fowers of this beautiful Dendrobe, showing as it does, a great range of colour in the different plante. The dark ricaly-coloured varieties appear to be the more common, although there are many lighter forms which are alway much admired. The white variety is very rare, If the atmoaphere about the plants be kept a trifle drier than usual, the bloom will remain freeh for a long time-a matter of importance where cat flowerm are much in request. As soon as the bloom is over, the plants should be placed in the cooler part of the East India-house, and kept rather dry at the root, water being afforded just as often as will prevent undue sbrivelling. Other species of Dendrobiums, viz, D. bigibbuw, D. superbiens, D. Goldei, sud D. Statterignam plants of which arenow in bloom, will require a aimilar kind of treatment when they are reating.

CATTLEYA8.-The best varieties of Cattleya eldorado are very desirable plants, and their fragrant llowera remain in beauty for a period of four or five weeks. At the present time these plants are freely making roots, and when the temperature of the Cattleya-house falls below \(60^{\circ}\), it will be advinable to remove them to the warmer East India division, and keep them there whilat the roots are active. They hould not be watered unleas actually dry, and then it should be thorough. To keep the potting matarials constantly moist certainly carsen the preado-bulbs to decay.

\section*{THIT BARDY RRUIT GARDEN.} by W. Pope, Gardener, Highclere Castle, Newbury.
THINNING AND DREBSING STANDARD TREES. The present is a very suitable seanon for the thinning of the crowns of orchard and other standard frait trees. Praning, as it is generally underatood, is rarely necessary in this department, but thinning is beneficial to the trees, and should be taken in hand, always before the leaves fall if time can be apared. It is so much easier to determine whether a branch may be taken away with advantage, when the foliage is on the trees, regardless of the known benefit of early praning. In the case of old or neglected trees, large branche should not be cut away at once with the view of thinning once and for all, as the effects would be worse than thöe which accompany neglect; but commence by taking out a few of the maller branches, and overgrown spurs here and there-an operation which may be rej eated year by year, and which together with manurial aids to the roots in the shape of woodashes, soot, or farmyard drainage applied during the winter will lead to a great improvement in the health of the treer and the quality of the fruit. At soon as all the leaves have fallen, the rough bark of the trunk and larger branches should be scraped with some blunt instrument to free it from moss and lichens, which form a hiding place for variou injurions insects and their eggs. These merapinge should be allowed to fall on to a sheet, so that they may be eavily collected and burned, as well au the leaver and mall prunings. It would be wall, if the trees have been inferted with insects, to thovel op urface-soil under them, and charit, fresh soil from land not ander fruit taking its place. When insecte give much trouble in orchards ander grase, it in sometime advisable to pare off and char the turf, afterwarde lightly pricking over and pulverising the ground, which is bett done with a digging-fort or

Kentish hoe, and applying a light top-dresaing of gas-lime or gas-water, the latter being ased on the branches as well. Gaf-water should be dilated with three time it balk of clear water. For the deatraction of moss on the trunks and branches, frestly-slated lime is an effective, and easily-applied meant. It should be scattered over the trees. when they are wet with rain or dew.
prunina and dressing apricots. - The unripened shoot may now be ahortened to a firm wood bud usually fonnd at the base of the shootn, and if the summer pinching wan properly attended to, not much praning will now be required. As soon as the leave have fallen, unfasten the treen, and wash the branches with warm sonp-ands, made by dissolving 4 oz . of soft-soap in one gallon of water; i soft brash hould be naed generally, but when the brown-scale is present, it may have to be dislodged by other mean before washing the trees. If the wall have many nail-bolev, and the pointing haa fallen out, some good mortar or cement should be used to atop the boles and make good, the pointing. When nailing the treen, be carefal not to braise the shoot, with the hammer, or have ties that will cut into the rind, a irjaries of this kind caase canker and gamming. Having finished the training of the trees, afford a dreaning of ahort dang, after lightly pricking op the surface of the border and pulverising the clods.

\section*{THI KITCEIN GARDEN}

By Joum Lambert. Gardener, Powis Castle, Welshpool.
LATE CAULIFLOWERS AND AUTUMN BROC-COLI.-In my earlier note on these crops I mentioned that all those intended for lifting should have the roots cut roand with the spade so as to check growth and prepare them for lifting. From now onwards, these crops are very important ones in most country establishmente. Owing to the mild weather hitherto enjoyed, we ought not now to be caught unprepared. If no light brick or turf pita are at command, some short, pointed, stout itake should be driven into the ground in a warm sheltered spot, and to these slating-lath should be nailed across at the top; in this simple manner protection may be found for a great number of plants. Leave standing all those with the more forward beade, which may be covered up where they are, or lifted when sharp froste threaten; but lift the bulk of the crop, and transplant them under the temporary protection made, giving them as much room as the apace at command render posaible, keeping the plante erect, which is easily done by ainking them a little deeper than they were before They should be jast clear of each other. All decaying leaves should be removed, and care taken to keep them free of these aftermarde, or the heads will become ill-tlavoured. Do not cover the plants with mats, \&ce, unless it be quite necenary; and when the froats get more severe, dry Fern or atraw may be used as an extra protection. In this manner, Broccoli msy be cat to the end of the year, and somecime later. Cauliflowern and Broccoll intended for exhibiting in November, should be left in the groand, and some mean taken to protect them from frost, bat dig them up before there is any ign of the card opening. Eadeavour to keep them white and freah; the leaves alao muat be green, nothing looking worse than Cualiflower heads stripped of all their leaven.

Chicory and 8alsafy. - The firnt-bamed tender roots should be the first removed from the ground, and stored in fine coal-ashes or damp and, the leave to be used later in the blanched state in salads. Salnafy I prefer to leave in the groand an one does Parsnipm, covering the ground slightly with litter as protection againat froat.
asparagus beds.- The tope of the planta being quite ripe, they may be removed with sharp knife or scythe, and all weeds palled out or hoed and raked off. If some of the tops with seede were saved, these bhould now be gathered, choosing the finest berrien only. Spread the berrien out to dry in a
rubbing out the seed when time permits.

THE FLOWSR GARDEIV.
By Bithex Wadds. Gardener. Birdsall Gardexs. York.
Winterina bedoina plante. - The eevere froute of the past week having cut down Dablias, the tabers should be lifted and stowed away in a thed from which the front can be excluded. Cat the stems to within 6 inches of the tabers, which should be placed on shelves or on the floor for a weel in order to dry the woil that fo abont them. After that
time they may be pat clovely together in boxes on the floor, or on broad shelven in dry pleces. Cover the roots aboat 1 inch deep with dry andy ail, and then, if the shed is dry and cool, and froat is excluded, they will keep well antil February or March. Hollyhocks, if of acasce varietiee, whould bo lifted from open bordert and potted into gond andy loam and leafooll, and the pote planged in old Muehroom-bed or other dry material that will not heat. A cold frame, or preferably pita from which the frost can be excluded, will anower for them. Cattinge that were etruck in Augunt may be planged in the ame place. Admit abondance of air during mild weather, keeping them plamp and fresh; but not over-watering them. If mildew or otber fangois growth occar, dunt the placta over with anlphar. Gladioli balbebould be lifted and dried in a cool airy shed, keepling them from frost. The Breachleyensis varieties are hardy in dry well-drained borders, but the surface should be well mulched to keep the irost from them. I prefer to lift them every Begonias and Cannas in the apring. Taberous a little, and the tabera afterwarde stored away in dry sandy oil in shallow boxes or on ehelves in a dry bed. If the temoeratare of the place in not allowed to fall below \(40^{\circ}\), they will keep very well.

CALCEOLARIAB.-Good early cuttinge of these were very acarce this season, owing to the drought They shoald be kept well ahaded and watered, that they may keep plamp and fresh until they have made roots, then affording them abundance of air, except during bharp frosts, when they should be well protected with mate and litter.

PELARGONIUM8.-This hae been a good season for atriking Pelargonium cuttings. Thowe in boxes will require very little water after this time. Ker p them ae cool as ponsble; it in better for them not to make much growth antil they are potted off in February. The floor of a late vinery is a good place for them. Oid plants that have been litted from the flower-beds should have all of the leaves removed, and be laid thickly together in leaf oil in pits or cool-houses, giving them a water to keep them from withering, and abandance of air. Do not cut them in any way at present, unless to take out decaying shoota. When pits or bed for laying-in old planta are not to hand, they abould be potted six or eight together into 8 or 10 -inch potis, and placed ont of the reach of frowt.
miscellaneoub. -Irenine, Coleas, and Alternantheras require to be lept in a warm or intermediato hoase daring the winter month, and care should bo taken to keep them clean from aphides by fumigation. Lobelia speciona, Verbenat, Gazanias, Ageratums, Heliotropes, Nierembergias, and the cool varieties of berding plante that are atruck in pote and atored daring the winter for propagating in the pring, may be kept in a cool airy house, and be carefully watered, not allowing them to get dry at the rootn. Fiowering shoote should be pinched out at soon as seen. A temperature of \(40^{\circ}\) to \(45^{\circ}\) at night, and \(50^{\circ}\) by day, will avit them very well. Centaurea candidissima may be lifted from the beds and potted into 5 or 6 inch pots. Well water them and place them in a cool house where they may have plenty of air, and be kept free from frost. Do not water them over the foliage in the winter time. These plants will give abundance of cuttings in the epring, bat anless old specimen plant are require for planting out, the stock is quickly increased by owing seed in February. Carnations and Picoteen that bave been potted for keeping in pits and frames throagh the winter must be kept rather dry at the root, affurding them sbundance of air, and removing the lights whenever ponible. The pots should be planged into cocoe-fibre or other good dry material, to keep the frost from the root, and covering need onky to be used daring aevere frosta, the planfa not being coddled in any way.

A Weleh Fosbil-TheE-A fire trank of a Fonsil-tree stand apright in the offices of the Maerdy Coal Compaay, in the Rhondds Fack. It wae taken out of the colliery nome time ago, and is 5 feet to 6 feet in length, and jadging roughly from its appearance, is over 2 feet in circumfereace. There is another tree in the colliery, and not yet removed. It atands on the side of a road, and only a portion of it can be seen, bat it will, no doubt, be removed nome day, so that people may have an opportanity of examining a nataral monament of the glorie of "Cymru Fa" forent. Western Mails Oct. 21, 1895.

SATURDAY, Nov. 30-Dunfermline Chrysanthemum.

Chiswick.
deners with some apprehension. The Council of the Rojal Horticultural Society has informed the public that changes are contemplated, but up to the present it has vouchsafed not a particle of informstion as to what its policy is likely to be. We need not do more than make passing allusion to the glorious history that attaches to Chiswick, the plants that were introdaced from there, the collections of fruits that were got together, the observations that were made in these old gardens. But this is all ancient history and the present generation, and still more the coming raoe of gardeners, is, or will be, if not wholly ignorant, at least indifferent to what has been done. There was a time when even the Council, extraordinary as it may seem, were compelled to negleot Chiswick. Owing to financial troubles, the garden was first reduced by more than half its area, and then the remainder was left pretty much to take care of itself When brighter days came, the Council very properly set to work to restore the dilapidations and ruin caused by years of negleot. Of late jears the expenditure has been large, but the result is seen in the general good condition of the buildings. Only two of the old ruinous houses remain, and these have long since been condemned by the Chiswick Board.

The Conferences on Apples, Pears, Ferns, Conifers, Roses, Pinks, Chrysanthemums, Dahlias, and other subjects, which have been held of late years in the gardens in connection with exhibitions, have been singularly valuable and instructive. Some of these, no doubt, could have been as well hald elsewhere as at Chiswick; nevertheless, the fact remains that the Conferences held at Chiswick have been quite the most successful of any-we mean, of course, so far as the falfilment of the object of the particular conference was conoerned.

The work done at Chiswiok at the present time is varied. As every gardener knows, there are each year numerous trials-now of this flower, now of that; now of this vegetable, now of that, whilst standard collections of fruit are maintained. The trials, so far as they go, are well carried out, and the results are carefally recorded. Especially are they conducted with sorupulous fairness and absence of bias. Complaint is made, and with reason, that the publication of these records is sometimes delayed so long, that their value for commeroial purposes is seriously impaired. That is a defect which can easily be remedied; and, moreover, commercial considerations are better left to the great tradegrowers, who have their own trial-grounds. It is ebvious that the results of these trials, organised and supervised by the saperintendent and his asaistanta, and periodically eramined by the several committee during the season, must be of far higher value than those obtained by the cursory examination made of specimens exbibited at the Drill Hall, and of much more importance than the opinion of individual gardeners paraded in trade catalogues.

In some cases the trials are superfluous. There is little atility, now-s-days, in the Society growing a colleotion of Chrysanthemams, Pelargo. niums, Fuchsias, or tuberous Begonias. These have long since passed out of the experimental stage, and the trade may be trasted to malke their trials on a larger and more complete soale than oan bedone atChiswick. Cannas, on the other hand, are at present relatively new in gardens. The publio do not yet know mach aboat them, and it is deairable that the Sooiety should grow illas-
trations of the various types, under various methods of cultivation, until they become gene rally known, and the most appropriate method of culture decided on.
A very large portion of the resources of the Society is now spent on the growth of plants for distribution to the Fellows. This is matter in which reform is needed. The plants grown are, for the most part, of no apecial horticultural interest in themselves, nor doen their cultivation present any problems to be solved, as they are, for the most part, of the easiest culture. They are plants which, spoaring generally, can be bought from the nearest greengrocer for a shilling or two. In the matter of cultivation they cannot reach the atandand attained by the market growers, who grow superb specimens of special things because they can devote an undivided attention to them which is not practicable at Chiswick.

The sale of Grapes, Tomatos, and other produce, is necessitated under present oircamstances. This is a great misfortune-a lament able departure from the legitimate work of suoh a garden, and an unjustifisble trespass on the funotions of business establishments.

With a gigantic conservatory and other houses to maintain, we do not wonder that succemive Councils endeavour to recoup some of the expenses of maintenance; but everyone will admit that to attempt to combine an experimental garden with a commercial establishment is to neglect the one department, and to conduot the other unsatisfactorily. All over the world this is so, as those may see who read the accounts of colonial gardens where commercial interests are allowed to be mingled with those of horticalture proper.

The resources of Chiswick and the labours of the staff should not be devoted to objeots which oan be as well, or better, carried out elsewhere; rather should attention be paid to matters whioh the average bortioulturist, amateur or commercial, has not the means to undertake for himself, or which it may be, for the time being, inexpedient for him to attempt.

Chiswick should be a great referenoe-garden, where authentioally-named specimens of the best fruit trees, and the best vegetables, should be grown for reference and comparison. Many questions of disputed nomenclature, which now-a-days are difficult or imposaible to solve, might readily be settled in this way.

In like manner, diverse methods of praning, and variations in cultural methods generally, should be tried. So far as possible all nen methods and all new inventions should be sabjected to trial at Chiswick. New plants of all kinds should be grown, and their value for hortioultural parposes be teated. With suoh a large constituenoy and so many foreign members, seeds of tropiosl and other plants might be grown for trial. What if the bulk proved to be of no value, even that information would be aseful, and in a few cases something interesting would be sure to turn up. As it is, we do not remember a single new plant to have been made known, still less distribated through the senoy of Chiswick for many years. What a contrast to what was the oase thirty or forty years ago!

Scientific experiments and "researoh"are, wo fear, hopeless without a competent direotor to initiate, watch and conduct them to a suooessful reault. The salary of a competent director of the kind we have in view would form so ots siderable an item in the jearly budget, that we fear in the absence of other support it would not be sanctioned. We do not forget that some years ago more than one series of experiments
were carried out at Chiswick under the anspioea of the Scientifio Committee. But the labour, and it was not inconsiderable, fell to the share of two or three busy men already overweighted with their own affairs. The ezcouragement
important-il not the most important-features of a national experimental garden.

Muoh more might be said in detail as to the proper functions of Chiswick, more especially in connection with a properly-equipped school of

LINNEAN SOCIETY. - The next meeting of the Society will be held on Thareday, November \%, at 8 PM ., when the following papert will be read :Col. Swimhos, "On Mimicry in Batterfies of the genu: Hypolimnae, Hübr." Mr. G. F. Scott Elliot,

(Grown in the Botanic Gardea, Cambrider.)
reoeived by the willing horses from the Council was practioally nil, whilst by the Follows at large the whole thing was ignored. The prospeots of experiments of this kind are therefore far from promising, and yet these experiments should undoubtedly oonstitute one of the most
horticulture sapported by the pablic funds and managed by the Society. The Council has raised our erpectations to a high pitch. We earnestly hope we may not be disappointed, but that Chiswiok may take its place as the first hortioultural experiment and reference station of the world.
"A Reviaion of the gena Pertar, Beath." Dr. A.G. Buther."An Accomat of the Battertien of the genus Charaxen, Ocha."

Royal Horticultural Society of ibeland. -Oa Wedneaday and Thuraday, Novamber 6 and 7 , the R ygul H articaltural S ciety of Iroland will hold
their annual Fruit and Chryanathemam Show. The show will be held in the premises of the Royal Dablin Society, at Ball's Bridge. Several special prize are offered for competition, including three challenge caps prezented by Lord Ardiladi, Mesare. Watrbiotse \& Co., and by the gardeners of Ireland. Silver and bronzs medals, and many presentation and money prizes will alao be competed for. The date of the show is earlier this year than usual, as the conncil were anzious to convenience exhibitors who might wish to attend the thow to be held in Balfat the following week, and also to allow of growers from the north competing here.

The Gardeners' Company.-At a meeting the coart held on Taesday, October 22, the Master (Lieat.-Colonel Grorge Laybert. F.D., F.S.A.) presiding, the clerk, Mr. R. Gofton Salmond, read a letter from the Commisuioners of Sewers, regretting that they could not accept the offer of the company to place seat in various part of the City for the convenience of the public. The company had been ensbled to make this offer to the Commistioners throagh the kinduens of a member as a memento of his election to the court. The seats will now be placed outside the City through the Metropolitan Pablic Gurdeas Association. The hon, librarian, Mr. Charles Welch, F.S.A., read a report apon the gardening library presented by the compsay in 1891 to the Gaildha'l Library, and sopported by a yearly grant from their funds. The namber of volumes has now reached eighty-seven, a large number of which were fortunately acquired at the asle of the library of the late Mr. Shirley Hibrerd Besides several important treatises on gardening in general, there are monographe on the Bagonia, Carnation, Cbrysanthemum, Clematis, Pelargonium, Narcissue, Rone, Vine, and other plants. The recent purchases include Nicholson's Dictionary of Gardening, and a apecially fine copy of Lindley's British Fruits. The booke are already largely used by the readers at the Gaildhall Library, and as the collection is rapidly growing in extent and importance, it will doubtless aoon become very widely known and appreciated. The example of the Gurdeners' Company may with greas advantage be followed by many of the more wealthy City guilds. City Press, Oct. 26.

The royal gardeners' Obphan fund.The asaal monthly meeting of the committee took place at the Horticultaral Clab on the 25 紬 alt., Mr. Willtam Marsiall presiding. The following apecial receipts were announced as having been rece ved during the past three months:-Legacy from Mr. J. Taplin, Havant, \(£ 55 s\); the Rev. A. Lowe, proceeds of collection at Harveat Tasakngiving, per Mr. J. Bennett, Barton-on-Trent, £6 68. \({ }^{2}\) Mearra. J. Criepin \& Sone, Show Rooms, Bristol, per Mr. J. H. Vallance, £5 5s.; Mr. Arthar Miles, Dadley Villas, Southampton, £2? 3s.; collected at Woodford Flower Show, per Mr W. W. Willoughby. £2; Bradford Paxton Society, per Mr. R. Scott, £1 108.; Mr. J. Barn, Abbey Park, Leicenter, £1 5s, ; the Miseses Evans, Wimbledon, 17s. ; Mr. H. Barbidga, Wentgate, 10s. \(6 d\). ; and collected by Mr. W. G. Head, Cryatal Palace, Sydenham, £3 15s. 8d. By menno of boxes, the followiog sums were obtained: J. Mr. J. Selvay, Bettashanger, Dover, £4 5s, ; Mr. J. McIndoe, Hatton Hall, Gaisborough, £5; Mr. C. Satton, Chevening, Sevenoaks, \&1 \(12 s_{s}\); Mrs.
H. B. Smith. Ealing, \(7 s .5 d\); and Mias Mcionald, Chichester, \(7 s\) s. In small suma, per the Elitor of the Gardeners' Chronicle, from October, 1894, to October, 1895, £2 48. The remainder of the business was of a purely formal character, and the proceding cloned with a vote of thanks to the chairman.

\footnotetext{
Peeblesshire horticultural Asbocia-TION.-The second meeting of the session of this Alourtahing Anociation was held in the Ieszer Good Templars' Hall on Tuesday evening laet. Mr. A. the minates of the previd, occupied the chair. After the minates of the previous meeting had been read Kingemendown, read ar. Mcaper on " The The Gardenn, Kingemendown, read a paper on "The Cyelamen:"
}

The South Shields and Northern Counties Chrysanthemum Society's extibition will take place on November 20 and 21, in the Royal Assembly Rooms, at South Shields. The achedule are in addition to local clasees, others which are open to all comern. Mr. Bernard Cowan in the Hon. Sec.

Marriage of Mr. Jackman.-On the 17th ult., the nuptials of Mr. A. G. Jackman, nareryman, Woking, with Mias Florence Sannage, of Leicester, were celebrated, and in connection therewith, the emplojes of Mesors. Jackman \& Sons were entertained to dinner.

Mr. Vernon Heath.-We learn with regret that this well-known photographer died in London on Friday, October 25, at the age of seventy-five. Mr. Heath's landacape-photography and his viewn of country-houses attained to a high degree of excellence. A number of them are in the Gaildhall Library. Among some of the beat he ever took were those of Burnham Beechen, a series of atriking, beautifal views. Mr. Heatr, a fem years ago, compiled a volame, entitled Fifty Years' Recollections, which was pleasant readiag, and contained many good stories.

Agicultural Returns.-Farmers and others interested in the caltivation of the soil, cannot bat agree that they are well attended to by the Board of Agricultare in the matter of statistics and other contribations to the literatare of the day selected for their apecial use and delectation. And this is certainly to be commended, especially as the Board of Trade retarns pablished every month aupply the same gentlemen with "matter sufficient to give them pause." Last week there was issued by the Agricultaral Dapartment whatis termed "Statistical Tables," showing acreage ander crops and grant, and number of horses, cattle, sheep, and pigs in the United Kingdom, with particalars for each connty of Great Britain-all preliminary to the annual and completed report for the year, to be issued at the usaal time. The pamphlet is made ap of an enormcan mass of figures, none of which do we propose inflicting upon our readers. Safficient to note here, the growth in the number of acres devoted to market-gardening, and to orchard cultivation. As to the latter, they (in Englanü, Walen, and Scotland), covor an area of 218.000 acres, in 1894 it was a trile under 214000 acres. As to market gardens they cover 92,837 reces, as againast 88,210 lant year. Bat it mast not be supposed that all of this land was withdrawn from other culture, for those who read of land ales, know very well that large eatates are being broken up into amall farms, which produce better returns for the vendor and form grand mpecalations for the bayers. As for fruit, there is not now a breakfast-table in the land lscking its jam-pot-jams of all aorts, aingle and compound, are in great and growing request; and in addition, sugar continues cheap. Decentralisation in the matter of markets is being duly recognised as beneficial ; and doubtlens, our frienda of the Agricultaral Department will more and more zee their way to extending their field of vision-eapecially in the matter of marte for asle, and the rexults in the matter of land and crop.

The Wonders of Fernland. - At the Memorial Hall, Farringdon Street, on November 5, under the auspices of the National Amatear Gardening Sucisty, Mr. Chas. T. Drubry, F.L.S., will give a lecture on this suhject, illustrated with namerons lantern aliden, showing photographically and actually the wonderfal featares of Fern life generally, and more eapecially of British Fernu, and their most beautiful varieties.

Coloured Glass and Strawberries.-We rend in Inventions of Oct. 22, that in caltivating Strawberries under glase of various colours, Prof. Zacharinwicz, of Vaucluse, France, has obtained the following resalts:-Ordinary clear glaes gave the beat and earlient fruit; orange gines increased the
vegetation, but injared the quality, size, and eurliness of the frait; violet glass increased the yield, at the expense of the quality; red, blue, and green glau were hurtful to all kinds of vegetation.

The Worcertershire Branch of the Gardeners' Royal Benevolent Inbtitution. -The inaugaration of this branch will take plece at the Guildhall, Worcester, on Monday, Nov, 18, and the chair will be taken by the president, Earl Beauchamp, Mayor elect of Worcester, at 3pm Several influential gentlemen have promised to sapport the chair and address the meetiog, whilut every effort is being made by the committee to secare a thoroughly representativa and accenfal gathering. All friend of the canse, and patron of horticulture, are cordially invited to be present.

The Late Professor Huxley--4 biography of Prof. Huxley is being prepared by his man, Mr, Leonard Hoxley, who will be greatly obliged if those who possess letters or other documents of interest will f.rward them to him at Chartertone, Godalmiag. They will be carefully retaraed atter being copied.

\section*{YUCCA GUATEMALENSIS, Baker.}

THIS species, the subject of our illustration, fig. 92, is perhaps the most imposing of the very ornamental genus to which it belongs. The drawing mere made from a fine specimen, which flowers abont every three years in the Botanic Garden at Cambridge, and where, no doubt, it has grown for many years. Owing chielly to its size, it is cultivated in the Palm-honse, where it is planted out, and, in order that too mach apace may not be occupied, it in cut back after flowering, and only one or two hoota are allowed to grow. It has a principal atem or trank, from which the flowering-branches proceed, and the treatment just alluded to accounts for the habit shown by the illuatration on p . 525 . With free growth there would be several stema, bearing an enormous mass of foliage. The main atem or trunk abore referred to, is about 6 feet in height, and aboat 7 feet in circumference at the base, whence it decreame in size to about the middle, again increasing nomenthas towards the point of branching. The flowering-sbots meaanared about 18 feet, including the panicle, the height of which was about 3 feet 6 incher, and foliage began at about 3 feet from the base of the shoot. The total height of the specimen, it will be seen, was about 24 feet. The panicle of flowera is rhomboid in shape, and utriking on account of its density, the flowers seeming to form a solid mase. They are (eee fig. 91, p. 519) from \(2 \frac{s}{s}\) to 3 inches long, the negments oblong-lanceolite, sharp at the point, and aboat 1 inch in width, tholer on the ontside broader than the inner. The colonr may be dencribed as ivory-white, and, speaking of the panicle, as a whole, it conld not eanily be nirpassed in magnificence.
Yucca guatemalensis belong to a set of about half-a-dozan species, which is characterived by having serralated leaves. All have a very shori peduncle, with the exception of \(Y\). rapicola, in which it reaches a length of 3 feet. Y. aloifolis is a ppecies too well-known to need descrintion. \(\overline{\text { Y }}\), jucatanas is similar, with lesven 14 to 16 inches long. Tho remaining ppecies, dencribed by Mr. Baker in the Journal of the Linnean Society, vol, xviii., are X. bre vifolia and \(\bar{Y}\). Deumetisna, the former having rigid leaves from 6 inches to 1 foot long, and one third of an inch broad, the latter with recarved leavel of twice that width, and either of a purple colvor. when young, or when older having a naror pale margin. The present epecies is the largag of all, ita leaven are onviform, 3 fer derls
about 3 inches wide near the middle, very about 3 inches wide near the middle, verf and figured br Mr. Baker, in Sander'a Refugium, in the year 1870, and, according to him, was incroduced about twenty yeara earlier.
known under a variety of names, \(\bar{Y}\), Roozli, Drecmote yaccoides, and D, enaifolia being perhape the mors familiar, The name adopted at Cambridge received from Kew, and may, therefore, be accepted without quention. Thongh referred to Gastemien. by its name, thim apecies iz also a native of Mexico R. J. L.

\section*{Home Correspondenoe.}

FRUIT FARMING IN BOUTH AFRICA.-In answer io the enquiry of your correspondent, "H. F. T." as to fruit farming in South Africa. as agent for the Cade Orcbard Co., I shall be glad to give him any information I can on the abject, if he will call and see me. or write what abjects be wishes to be informed on. My son, who has jast retarned from the fruit diatricte of South Africe, will alao be able to enlighten him on most of the points connected therewith. G. E. Budson, The Cape Orchard Co, Limited, Suffolk House, Laurence Pountney Hill, Cannon Street.

FLOWERING OF THE JERUBALEM ARTICHOKE. -An a consequence of the prolonged warmth, this plant has been blooming in abnudance in the market gardens in and around Bath, and bes thrown up atems to the height of 10 to 12 feet, bearing cluster of bright yellow flowerm, which when cat are uteful for decoration. F. Nash, Bath. [It ir not uncommon in warm yeart. Ed.]

THE GUIDE TO KEW GARDEN8.-When greatly enjoying a recent visit to these fine gardenr, I was mach disappointed to find that the popular guide had been out of print for some time, and not one to be had for love or money. Perhaps the authorities would advertise these guides in the Gardeners' Chronicle, and the other gardening papers. The want of this gaide and the shortness of the time available prevented me from making notes of the herbaceons plants and others in bloom at the time of my visit. D. T. Fish.
pruning fruit trees.-After reading Mr. J. Simpson's article ander this heading in your lat issue, I came to the conclusion that to write anything which thall be clear to the mind of the ordinary reader is a difficult matter. Mr. Simpmon professes to criticise what I have written, and I feel sure that he wishes to do so, but what he criticises is very far from what I intended to ary. I have not a copy of my paper before me, bat I would ank, whence comes the atatement that a atandard tree, or, indeed, any other, should be pruned as a bain: I amperfectly sure that it in not to be found within the limits of my bort paper. I am, of courae, aware that the greater part of the more recently-planted orcharde in California are proned in this way, and the praners find the resulte excellent, despite Mr. Simpon's experience, but I certainly never advocated it. What I said was, "that all branche must be so disposed as to admit the sunlight and air into the middle of the tree," but I fail to see the necessity of catting out the centre of a tree, so that the an may reach it, and certainly after it was removed, it could not be fertile. No, I do not advocate a basinPhspe for atandard trees in this country, for I think that a tree with in central axis from which the branches radiate, is much better calculated to resist atorma, and much more eanily managed. What I wiahed to insint upon was, that the branches radiating from this contral axir, thould be placed wide enough apart to admit sunlight into the interior of the tree; this, after the first praning or two, is a very simple matter, and if any croaning branchen be removed, and the thin growth which often aboot up from the lower portions of branches and make the interior of apple tree like a crow's neat, be cat out, the leas praning a atandard tree geta the better. I fancy all this difficulty has arisen from the writer having amused himself with mixing up atandards and cordons "in the frait-bearing habit, of which," he eays, "there is not an iota of difference." Let us grant this proposition, it is perfectly true of a really scientifically pruned pyramid. such an I have helped to prone in years gone by in Mr. Van Hoatte's garden, near Ghent, but I fear it would be quite out of the queation to prune a atandard tree in such a way, and, at any rate, the umbrella-baped head into Which no light or air could penetrate, which seem: dear to Mr. Simpan's heart, is as far removed from cordon training as the equator from the poles. Mr. Simpan eay that my directions on the aubject of pruning standards and cordons are contradictory; they were intended to be so, and I rejoice to find that at least on one point I have been understood. My remark were upon praning young treen, and my reason for cutting away two-thirds of a healthy atandard wes, that it should make strong vigorous growth to form the tree of the futare, and to prevent ite bearing frait. This in the rock apon which we aplit-the non-pruning of freshly-planted atandard trees. I want my young tree to make growth and not frait, and therefore I am dubbed a "mutilator."

(see p. 52s.)

I am content, the "little band" is growing fast, and I bope one day to find my critic creeping into the fold; bat becanes we prune our young trees to prodace growth, and our formed cordon, eapalier, and pyramid trees to produce fruit, we are held up to ridicule-thit I do not consider rensonable. Mr. S. admits that my advice upon praning cordona is sound, this makes me happy, and as, in pite of his mixing the two together, I intended the edvice upon prasiag young atandard to be diametrically opponite, after all, I think, I must have made myaelf underatandable if not underntood. The quoted remarks of Mr. Wilks, to which might be added those of the late Shirley Hibberd and hoats of othera, as to non-pruaing, do not enter here at all. I wrote a paper on pruning, not on neglecting to prane. I do not for a moment say that the majority of atandard trees are not better if in after life they are left, practically apeaking, unpraned, i.e., if they simply have crossing branches and bruch wood removed, but before one can leava them to thus etand alone, they mut be trained in good way ; this is obvioue, or one might reduce the question to atter abardity, by aying that a tree should not be praned from the time the grafe is pat apon the stock in the nursery. On the other hand, all forms of garden trees, eapaliers, cordont, and pyrawidp, must be praned to obtain the bent resulte, and surely becaune a certain section of the public, profencional an well at amateur, are no incompetent as to ruin their trees when they attempt to prane them, this is no resen why we should abatain from trying to throw ome light apon the surject. No, Mr. Simpan, you no doubt thoroaghly anderatand praning, and you should have taught your man how to use his knife, and not have bargained that it nhould be kept in his pocket. A. H. Pearson.

WINTRY WEATHER IN YORKBHIRE.-Daring the paot week there have been experienced in this jocality a aharper anap of winter for the time of year than has been known for twenty-three jear. The loweat reading of our thermometers have been \(20^{\circ}\), that is \(12^{\circ}\) of frost; but I bear of a neighbouring gardener who has registered \(14^{\circ}\). Oa Saturday morning last there wa a complete covering of now, which in places the sun does not reach, itill lays on the ground. The ground this morning (Saturday last), wae hard enough for us to wheel manare apon the vacant quarters in the kitchen garden, sare occurrence in October herosbouts. B. J. C., Griunton, Tadoaster, October 28, 1895.

IN 8U86EX.-On the morning of the 27th the mill-pond in front and behind Uckfield Mill was frczfn over. Such has not occared in October before for the path forty-six years. All outaide fowers have disappeared as if by magic. A.P.

IN KENT. - During the lart few days I bave been travelling in that garden of Evgland, Kent, and have heard of a robin's neat with egge, and rooks engaged in nest-bailding; and have seen Bhododendron ponticum in flower, also Laburnuma and Pyras japonica; and I bave gathered Apple blowom from tree bearing grand crope of frait. On Fridsy, October 25, I gathered ripe Strawberries and grand Raspberries from plants in the opan, and there are good crops of these fruit in places. Tbat grand old Rone, Gloire de Dijor, and ochers are flowering profusely on cottege walit, and fiae blooms too, proving what a remarkable seanon it hes been; and now in some districts evere front hat set in, \(10^{\circ}\) to \(12^{\circ}\) being noted, killing all kind of tender things, eapecially bedding planta, Dahlia, \&c., and making terrible havoc. A. O.

THE TRUTH ABOUT PRICE8. - What jolly time we poor growera might have if the pricen for Apples and Plum given in that cheerial prize ensy were only correct! £26 per ton menas sbout 11s. pur nieve. Apples differ in weight, bat 48 lb . per sieve is not far out. Wellingtons, when well-grown and well kept, letch as much as eny sort, and wo munt look back to 1889 , when that severe froat ipoiled to mady Apples both rative and imported, to find a bushel elling for 128, after the winter was over, and when I marketed 869 buhels of winter kiade. But that is the sort of good luck which comes to one once in a lifetime. In March, 1895, Welliggtons were 8s.; to-day they are \(4 s\), and very fine fruit indeed, but the frait will not kefp, it haviog been grown on caltivated land; those from orchard are atored for afxt upring. King of the Pippins is making 48 . 6d. per buphel now; in Octnber lat they were \(5 s .6 d\). and in November, 1893, 58. Of coarse, there are carriage and commianion to take off thene prices, which coss
me 1s. per bashel. Czar Plume last Auguat were 38 per buahhel, Rivers', 9s. In fact, a glance as any otatements. Mid Kem. the fallacy of the ensayis's statemente, Mid Kest.
well to call attention sondent, "D. T. F.", does of forther explanstion as to these, as put formard in the Royal Horticaltural Society's prize ensay. Are the pricen quoted averages? If no, how many yeara, and from what nource received, open market, or from private shop or otherwise? I know that the top price for good Blenheim Orange Pippins, or King of the Pippinz, offered by large bayers in this country, does not at prement exceed £ 8 per ton: while quotstions from markets 2 wey are from \(£ 7\) to \(£ 10\), the rail way and market chargea taking away from these £2 10 £ 3 per ton, the nett retarna being at the rate of \(£ 5\) to \(£ \varepsilon_{0}\). Your sverage market quotations are also very much on the asme scale. \(R\).
The Gardens, Whitfeld, Herefordshire.
MUBCAT OF ALEXANDRIA VINES AT PRE8TON
HALL, MAIDSTONE. - Amonget the many ex-
amples of pood caltivation to be seen in the gardens
at Prenton Hall, is a vinery of Maccat of Alezandria.
This vinery wan planted in April, 1894, and the
Vinet were cat back in Febraary of the present
year. The canes are fully 26 feet long, short-jointed,
and over 3 inchen in circrmference at 5 feet from
the groand. The border is ontaide. These Vines
afford promise of rendering a good account of them-
selves next reason. Mr. Jarman, the able gardener at
Preaton Hall, intends replanting all of the vine-
ries there by degrees; and should they all do at
extroordinary.
be been at foot of this al fund.-Reniding, an will be seen at foot of this note, a considerable distance from London, and eeldomenoing that way, I have not had the opportanity of reeing the work done at Chiswick, and am not in a position to give an opinion as to its merits. Judging, however, by the abundant tastimony of those who have seen thet work, both as exprensed in your colamak and in private correapondence, I am folly antinfied that, on the whole, it has been real nolid work, and as mach, deserven the praine of all horticulturiata. Pernonally, I am of
opinion that, as a rale, the beat teatimonial aman opinion that, as a rale, the beet teatimonial a man
can have for any good work he has done, is the atill amall voice of conncience. No doabt there may be exceptions to this rule, as in the very excellent services Mr. Barron has rendere das Honorary Secretary to the Gardenert' Orphan Fund. Having bad some little to do with aggenting the idea of acha fand in the early part of the Jabilee year of 1887 , I shall gladly give my mall mite to the Teatimonial Fund now being got together on his behalf. At p. 81, vol. iii., of the Gardeners' Chronicle for 188\%, you pabliiked a fow notes from me bearing apon the fair Fart already made in entablibhing a Gardeners' \(O\) rphan Fund; an the following extract bas some bearing on my point now, perhape you will let me repeatit. Amongat the many otherr who bave given their time and experience to mataring plant for the futare working of the fund and other organiting work in connection therewith, I think that mach is due to Mr. Barron of Chiswick for aning to freely his great horticultaral infurence on its behalf. I can asy this the more freely an I have not the honour of being pereonally acquainted with him, or bat very alightly." As to the latter portion of this extract matters Wemain as they then were, we have not met since. Withont in the leat wishing to detract from the Tery excellent work done by the chsirman, com-
mittee, and others, in connection therewith, I atill mister, and others, in connection therewith, I atill hon, wecretary. It is on this groand I ventare to nuggest to all interested in the good work of helping those who cannot help themelven, i.e., orphan children, to add their mite to Mr. Barron's testimonial fund. I asy mite advinedly, as I take it the smallest sum will be acceptable as well as the larger onenjant according to the power of the contributoro \(B, J_{\text {. }}\)

\footnotetext{
Bougainvillea banderiana. - I war interented on reading your correapondent, "R. D. s." note on this plant in the iesue of the Gardeners' Chronicle for October 19. That it is distinct frome B. glabra I am willing to admit, but I whe under the impression with us it has not proved itering, but, unfortanately. be glad to know how iteelf to be ascho I shail this reapect in other gardenve. Elity hach. behaved in this reapect in other gardens. E.E Beckett, Elotree.

\section*{Scientific Committee.}

Octobre 15- Present: Dr. M. T. Masters (in the chair) ; Rer. W. Wilk, Mr. J. Weathert, and Rer. G. Henalow, Hon. Sec.

Iniury to Foliage by Wind.-Mr. Ch. Plowright, of Iynn, sent phutographs showing how trees, \&c., were damaged on
the north sides by a cold wind on May 16, with the following the north sides by a cold wind on May 16, with the following May 14, we began to thing our fruit crop was safe for the year;
but on the 15th the temperature fell, and on the l6th we had a gale from the north, accompanied by one or two hail showers. The effect was seen in a Hawthorn hedge facing north and couth for the foliage was shrirelled ap on the north side where it is north side was quite blacir, not a leaf eacape 1, while the opposite side did not seem to have suffered at all. A row of Elms showed graphically which way the wind had blown, and some fine old Beeches assumed on theirnorth side quiteanautumnal hue. The
Horse-Chestnuts, from the size of their leaves, afforded very distinctive evidence of the injury they sustained, the foliage having turned a bright red. The above effects were general in this part of Norfolk ; indeed, no tree which was exposed in the least seemed to have escaped. One of the most striking incidents is the Spruce Fir; at East Walton there is a row oif
these trees, whose young shoots have been filled by the cold wind on the north side, and hang like brown plumes at the probable effect of salt, but as a north wind at Lynn is entirely a sea wind, the disastrous effect to the foliage was probably Young Apple Fruit.-Mr.T. Eyre, of Thorpe Lea, Egham forwarded a sample of a second crop of Apples, due to the
prolunged high temperature. Raspberries and other fruits, as well as Laburnum, \&c., in blossom, as the Secsetary season.
Cattleyz Mossic...with Double Growth.-Mr. W. C. Walker
forwarded a photograph of an abnormal specimen with the following remarks:-"I enclose a photograph of Cattleya Mossix that has developed an unusual double growth. When it started after flowering it appeared little different from ordinary growth, but as it grow it formed the two distincs arowthe included in one green sheath at the base.'
Aphides on Lettuces. - With regard to the aphiden in the soil about the roots of Lettuces sent to the last meeting, Mr. G. B. Buckton of Weycombe, Haslemere, reports as follows:-
"As the earth was loose the haling during transit and the comparative drought killed the insects; but I secured ffty or satisfied that they are Pemphigus lactucr (Paserini). This species is subterranean in its larval condition, and it attack also Sonchus and Meliotus. On opening the box two winged flies escaped, one of which I secured, and it turned out to be a true Pemphigus. The pupe are without nectariee, and alnoost if not quite blind. The winged female has moderste eyen, and black. A diagnosis of the insect will be found in Aphidida Italica Passerine, p. 77, 1885."
Monstrous Ancmone japonica.-Rev. C. Wolley Dod sent specimens of the foliage with the following remark:- "Six yeare ago I noticed a shoot with crimpled leaves, andseparated it: pext year, with ordinary soil and cultivatiun, it asumed
this monstrous form. It has entirely lost the usual running this monstrous form. It has entirely lost the usual running rize, evidently at the expense of the increase of the plant.
Supposed Spontaneous Hybrid Asters.-Mr. Dud also sent a flowering plant of a supposed bybrid between 4. Thomson: Clarke, and A. omellus, Linn.. remarking, "This came from seed collected in my cwn garden. It bas now flowered for five years. It begins to flower early in Jaly, and continues in flower till hard frost. It hat pever produced fertile seed. The other hybrid was between A. Thomsoni and A. pyrensens, D.C. A. Thomsoni produces good seed very sparingly, but one plant growing between two plants of A. pyrensezs produces good soed plentifully. Some of these seeds produce typical A. Thomsoni, and often the nondescript plant sent. This is entirely sterile. I have raised many for two or three years in anccemion. They alway have a white pappus to the sears in anccosion. They al way harea
chene, which A. Thomsoni never has."
Some Bistoric Cedars.-Rev. G. Henalow described two large Cedars (Cedras Libani) in the garden of the Rectory as Bishop's Waltham, which, since their age is lnown, are perhaps worth recording. They were planted to commeroorate One, indeer. has so greatly sufferec in a storm, that nearly haif the tree has gone. This one must also have loet to leader at a mparatively early date, as the main trunk now suddenly branches into five large erect minor trunlrs. It is 42 feet in height. The other has retained ite leader, and is about 50 feet high; three of its larger boughe are gone. The girth of the trank of the first at the parting of the roots is 17 leet. The girth at a height of 5 leet from the ground and juat below the loweat boagh is 15 feet. The firth of the lowest bough is 6 feet. This bough arises at a height of 5 feet from the groand. The girth of the trunk of the other at the parting of the roots is 17 feet. The girth of the trank at a height of 5 feet from the ground is 14 feet. The girth of the base of the lowent bough is 5 feet 2 inches. This bough ariee at height of 1 foot 3 inchet from the ground. A bough at a height of 1 foet

4 inches from the ground has been sawn off, revealing fifty-
veven rings of growih. In all the boughs removed the eco tricity is remarkable; in one instance the centre :he ecomfrom the upper suriace, ane stinches from the lower. The
gituation is high and the soif clay. Both trees are bearing cones.
Pear Disecased.--Mr. Veitch, of Exeter, forwarded a Pur
attacked by a fungus. The latter had assnmed a roter attacked by a fungus. The latter had assumed a remarkabie investigation.
Parsnip Diseased.-Mr. Reid, of Culing, forwarded a portioe
Turnip-rooted Parsnip, with purple interior, apparentio
so some fangus. It was also forwarded to Ke .
October 29.- The meeting on Taenday leat is the Drill Hall, Wentminster, was remarkable for large diaplay of Potaton. These were chiely in illasiration of a very intereaing lecture oe the anme azbject, which Mr. A. W. Satton delivered in the afternoon. Near upon fifty lantern mliden, which had been prepared by Mr. Sutton in connection with the lecture, were greatly ap secisted. Orchide were, as uscal, exhibited before the committee, bot were fow in number. Chrysanthemam noveltien were namerous, and a number of awerds were made. The cold weather did not prevent the exhibition of a group of Crotons, and a few other house planta.

\section*{Floral Committee.}

Present: W. Marahall, Evq., in the chair; and Mearr. J. Laidg. H. B. May, H. Herbat, R. Dena, Briscon, G. Steven, J. Jenning, C. J-fferien, H. Blick, H. H. DOmbrain, H. Cannell, and J. Barr.
ontrast with the usually pleasant duties of the comnittee, whes the vote of condolence unanimously paseed on this occasion to the widow and family of Mr. C. F. Banse, whow decease was reported in our iesue of last week. Mr. Berus Was a very much respected member of this committee.
Messre. Jas. VeTtc旦 \& Sons, Royal Exotic Nareary, Kingi Road. Chelsee, showed some clearly hybrid Begonias in bloos, obtained by croseing B. socotreas with a variety of the tubenpors rooted section. An Award of Merit was recommended to Success, a rosy-crimson-flowered variety, semi-double, greenidiyellow in the centre; the habit of growth much resmblo B. socotrana. Eclipse, Sidonie, and Splendent are Farieties difforing from Su ccese chiefly in the shade of colour in the fowers.
Mesars. R. W \(\triangle\) II 4 CE de CO. Colchester, exhibited haltadozen plants in flower of Lycoris aurea. Spikes about 14 inches long, bearing six or seven golden-yellow flowens about bes across. The leaves are developed after the plant has owered. A very pretty specier from China, introduced to his country more than a century sioce, but lost again to culti ation until a year or two ago (First-class Certificate)
Nerine Alleni, a zeedling from N. corusca major, cromel with \(\mathrm{N}_{\text {. }}\) eamiensis, was exhibited by Mr, R. H. ALLEN, Guers bey. The flowers are very closely placed on the scape, and are a good rosy-crimson in colour.
A collection of amall Crotoas, well-coloured, was exhibitol S. S. T. Fisker, Eqq. (gr., Mr. G. Bond), amonget which wer soreo neeinl and pretty plants for winter furnishing (Silve Eanksian Medal)
Memart. B, S. Willians \& Sons, Upper Holloway, Londan, exibited a plant of Bouvardia Silver King. The leavea are ariegated with white margins, and the flowern are coral-red. From Mr. Antrony Wa'erer, Knap Hill Nureery, Wokine ame a plant from 20 to 30 feet high, of Quercus americana nea splendens, a very effectire variety of the Scarlet Oak.

\section*{CHBYSANTHEMUMS}

Novelties in Chrysanthemums were numerous. Awards of Merit were made to Dorothy Gibson, a glorious true reflered flower, of a deep shade of yellow, from Mr. R. OwEw, Maiden bead; and Rose Owen, an incurved flower of the Violet Tomlin type, hut paler in colour, the prevailing tint being palo cinlish-rose, the petals, and especially those in the centre, ipped with the petais, and especially those Lann, another pped with white (R. OWEN). No Florence Laul, an bede, inely-formed reflezed flower, of a slear bright mulberry and shaped well ; and Mrs Briscoe Ironside, a loply full, and shaped well; and Mrs. Briscoe Ironside, a lomen flower, of a delicate creamy or silvery-blush tint, with lemom centre-a large, full, incurved Japanese, in the way of Editio
 Briscoe.Ironside, Burgees Hill. To Fdith Tabor, a large, very broad-petalled soft yellow Japanese, with drooping. NOT fureto, and highly effective in a stand, from Mr. R. C. Narge browich. To Mrs. Charles Blick, another a citrom Lite, broad-petalled, incurving Japanese, having a itants exire-vigorous grower, repreaented by a dozec plang single stoms, of quite dwarf growth, and each carryig \({ }^{2}\) huge flower, exhibited by Mr. C. BiIcK, The Gardens, 2 , Werren, Eayes; to Beanty of Teignmonth, probably the whis magnificent variety of a Japanese Chryeanthemam sow meason, the surface of the broad incurving florets wig erimano-amaranth, with silvery reverse; the florets not wh much incurved to hide the brithant surlace colonring, wh large and full. Last year, this was thought to be lile Dulb of Yori, but this season it has proved that it is quite dirtinet in character; from Mr. J. AGATE, nurseryman, Eavnt, To Fellow Source d'Or, a pure pale yellow aport from this ald and favourite decorative variety, the sport promising the as popular for decorstive and market purposes as the from Mesars. H. Cannell \& Sons. To incurved, Conser and
bright: to single flowered Annie Holden, a pleasing sulphur sport fruct the well-known Mary Andeson; to Queen of the Buffs, bripht buff, with a slight pale crimson surface to the petals, and very thin side edgings of the same,
novel and distinct; and to Mra. E. G. Whittle, very delicate sulphur-white, having large, broed, incurving florete, some what loose at the base, a variety which gained an a ward for its colour more than for its other merits, all from Mr. H.J. Joves. Lewisham; and to Mons. Chinoo de Leeche, a very large and massive flower, having broad florets, the surface tinted and striped with cerise, deepening to pale purpie on
the basal florets, the reverse doep gold, a very fine and distinct the basal florets, the reverse deep gord, a very fine an
Japanese, from Mr. W. WELLS, Earlawood, Redbill.
Other notable new flowers, were Maggie Shea, yellow, with a slight white tip to the florets; snd Miss Ellie Teichmann white, with sulphur centre, both very promising, from Mr. C. E. SHEA, Foots Cray, Charles Young, deep, rose, with alight shading of violet; and \(A d a F\) Fulford, an incurved variety, buff. the reverse gold, with slight lines of purple on some of the older florets, both from Mr. R. OWEN. Mr. J. F. MCLEOD Dover Holse, Roehampton, had Japanese Belle Jeune, clear yellow variety of mediuma size, like Lad Chirine
From Mr. W. E. Tinx, Havant, came Duke of Connaught From Mir. W. E. THDY, Havant, came Duke of Connaught,
a large yellow incurved Japanese, the bagal petals some what droping, in the way of W. H. Lincoln; Mr. T. G Foster, deep yellow, of a fine depth of colour; and Zelandia, a large, broad-petalled, fully incurred Japanese, of the Queen type. Mr. Rrckwood, Fulwell Park, Twickenham, had Japanese Fulwell Park, the florets white and yellow. with slight stripes of pale purple. From Mr. GEO. STEVENS, Putney, came incurved Madame F, Minstral, pale rosy-purple, and golden centre. Mr. H. J. Jones had incurved James Murray, very like Princess of Wales; and D. B. Crane, inMurray, very like Princess of Wales; and D. B. Crane, incurved, not in such good character as when shown at the Boyal
Aquarium Mr. H. Cannell had plants of Kentish White, a Aquarium Mr. H. CANNELL had plants of Kentish White, a
very promising incurving white Japanese, with pale yellow centre, dwarf in growth, and highly promising.
Mesirs. Veitch \& Sons, Exotic Nurseries, Chelsea, had a fine and attractive group of plants, some of them bearing remarkably good flowers, the most noticeable being Louise D Black, Warrior, Palenza, Louise, Madame Calvat, Mutual Friend, M. George Biron, G. W. Childs, and other leading varieties (Silver Flora Medal).

\section*{Orchid Oommittee}

Present : Harry J. Veitch, Esq., in the chair; and Mesara. Jas. O’Brien (Secretary), T. B. Haywood, Sydney Courtanld, W. Cobb, T. Statter, T. W. Bond, E. Hill, H J. Chapman, J. Gabriel, H. Bullantine, and H. M. Pollett.
Chough fewer groupe than there wasa dice show of Orchids though fewer groups than usual were staged. Messrs. Jss.
Vkuci \(\&\) Soxs, Rogal Exotic Nursery, King's Roadochelsen, Ventri \& Sons, Royal Exotic Nursery, King's Road "Ohelsen, Lælio-Cattleya \(\times\) Euphrosyne (C. Warscewiczii ơ, L. pumila Dayana \&), was a plant of dwarf habit, with a very large and well-formed flower, with sepals and petals of a light rose colour and narrow yellowish margins, and bright purple lip, with a lilac tip and primrose-yellow dise (Award of Merit) Cattleya \(\times\) Eurydice (Acklandiæ J́, labiata of ), a very charming novelty, with the colours of Cattleya amethystoglossa, and the size and somewhat the form of C. Walkeriana nobilior. The very dwarf plant bore a wax like flower, with ovate sepals and petals of a pinkish-lavender hue, bearing a few parple apots;
the lip being rich crimson on the broad, flat, front lobe, and tips of the side lobes; the base blush-white, and the disc yellow. Their beantiful Cattleya \(\times\) Mantinii, two varie ties of which were now eshibited, as on the former occa Mesors. Vetober 15), now secured a First-class Certificate. Messrs. Vertcri also showed Lellio-Cattleya \(\times\) Statteriana, hybrid Cypripediumg.
Mons Georges Mavtin, Château de Bel Air, Olivet Loiret, France, after whom the Cattleya Mantinii (C. Dowian \(\times\) Bowringiana) was named, sent a prand plant of it, with a noble inflorescence of rich rosy-purple flowers, with orange centre and maroon-crimson front to the lip. It was said to differ from the original, and in consequence was named C. \(>\) Mantinii colorata, but seeing that the three which Messrs Verrcer exhibited also differed from it and from each otherone of Messrs. Vertcris being brighter in colour than Mr. MuNTIN's-it was decided to award the Certificate as to the type, and as such it received a First-Class Cerfificate.
Sir Tretor Lawrence, Bart., Buyford, Dorking (gr., Mr W. H. White), showed Houlletia tigrina, an old but ex tremely rare species with decumbent inflorescence of large flowers, which were French-white freckled with rose; the lip ivory-white with crimson spots. A most singular and hand some species (Botanical Certificate)
Thos. Statter, Leq., Stand Hall, Whitefield, Mancheste (gr., Mr. R. Johnson), shcwed a very interesting group of rare Orchid blooms, for which a Silver Flora Medal was awarded The most remarkable was Cattleya aurea Johnsoniana, with ligut bufif eepals and petals, marbled with rosy-lilac, and a very bearitiful and ample dark velvety crimson lip with gold veining. It comes nearest to the fine C. aurea marmorat Which received a First-class Certificate from the Right Hon. Lord Rothschild's collection; and Mr. Statrers's received a imilar award. In the group also were six other grand forms of Cattleya aures, some very handsome C. labiata, including C. 1. excelsior, with flowers prettily flaked with purple Cypripedium \(\times\) Edwardii, and the pallid, green-tinted C. Spicerianam viremcens.
Masars. HuGH Low \& Co., Clapton, were also awarded a Silver Flora Medal for very bright and effective'group

Orchids, in which fine varieties of Cattlega labiata figured conspicuously. The remarlably handsome Cypripedium nsigne, var Laura Kimball, with clear yellow unspotted flowers bearing a broud band of pure white on the dossal sepal, was also shown, and received an Award of Merit. It is of the

Sanderas class, and differs in having the yellow of a darker tint and in some otber respects. Also in Mesars. Luw's
group were Cypripedium Charlesworthii unicolor, a small but uniformly rose-tinted form; a very distinct form of Oncidium hematochilum, O. ornithorhynchum album, O. varicosum. and rarious other showy species.
Messrs. F. SANDER be Co. St. Albans, staged a group of Orchids, in which were the finest and richest-coloured forms of Cattlega labiat yet exbibited, the handsome rose-pink and cream-white Calanthe \(\times\) Florence, and the pretty C. \(\times\) Clive, Catasetum Christyanum, Laelii pumila marginatm, a Ane pan of the stately white Habenaria Suzannee, some pretty specimens of Sophronitis grandifiors, Zygopetalum criaitum, Cattleyas, Cypripediums, \&ec.
R. I. Meagures, Eaq., Cambridge Lodge, Camberwell (EP., Mr. H. J. Cbapman), exhibited Cypripedium Allenianum

\section*{ariety (Award of Merit). Catelega labata, K. I. Meaqurey} variety, a most charming pure white Hower with delicate ping veining on the lip, and which had been previously C Arthurianum, C. \(\times\) Chas. Bichman, O. insigne Cambridme Lodge var., C. \(\times\) Leeanum superbum, Cattleya \(\times\) Hardyana, ac. A Silver Bankgian Medal was awarded.
Fred Hardy, Esq. Tyntesfeld, Ashton-on-Mersey (gr. Ir. T. Stafford), showed Cattleya Bowringiana gigantea, a very finely-coloured and extraordinarily-large form (A ward of Merit); the handsome white Cattleya labiaむa Cuoksonir, Cattleya \(\times\) Harrisii (Leopoldii \(\times\) Mendeli), a very beautiful soft rose, war-like flower; and a rery fine lot of cut spikes of some rose, war-iike fower; and a rery fine lot of cut spikes of some Medal).
Geo. C. Raphaki, Esq., Castle Bill, Englefeld Green (gr, Mr. Adame), showed Cattleya labiata, Raphael's var, with brilliantly-coloured flowers of fine form; Vanda courules, Raphael's var. : a fine spire of almost circular, pale blue flowers, netted with violet, and with violet lip; and the rare and pretty Zygopetalum Burkei.
Messrs. W. L. LEWLS \& Co., Southgate, showed a small collection of Orcbid blooms, in which were Cattleya labiata in several good examples, Oncidium varicosum, O. protextum, Cypripedium insigue Maulei, dic. Mons. Tri'fail r, Pat des hantiers, Versailles. sent Ladio-Cattleja \(\times\) Andreana (bicolor
\(:\) elegans), of siender growth, and resembing a small L. -C . elegans), of siender growth, and resembling a small L.C. egans, but with ovate, slighty recurved purple front lobe to
he lip. RegiNald YouNa, Esq.. Sefton Park, Liverpool (gr.,
Mr. Poyntz), sent Cattleya labiata Youngianum, Cgpripedium \(\times\) Clotho (politum \(\times\) Bozallii atratann), and Leplia promin. Waluer C. Clazk, Esqo. Sefton Park, Liverpoal, sent
arieties of Cypripedina insigne and Cypripedium \(\times\) (villomam varieties of Cypripedinm insigne and Cypripedium \(\times\) (villosum \(\times\) Leeanum superbum). Whlemerorce Beyant, Fsq.e Stoke
Park, Slough (gro. Mr. D. Kemp), sent a grand infloresceace of Cattlega labiata, Stoke Park variety, very fine in colour.

\section*{Fruit Committee.}

Present: P. Crowley, Erq., in the chair; and Mears. S. T. Wright, J. Caeal, J. H. Veitch, H. Pearaon, W. Pupe, A. H. Pearnon, G. Bunyard, J. Wright, A. Dean, C. Herrin, W. Baten, G. T. Miles, F. Q Lave, H. Baldernon, G. Reynolds, R. Fife, and J. Hadson.
An interesting exhibit of Vine leaves, naturally tinted with autumn colours, and displayed on atretched white canvas, was reade by Messrs. D. \& W. Buchanat, Forth Vineyards, Kippen, who grow them for commercial purposes ; very fine Grapes, \(G \cdot 09\) Colmar and Alnwick Seedling; also clustera of fruits of Tomato, Forth Vineyard Selected, were exhibited. The produce had been grown by the use of Thomson's Vine and Plant Manure (Silver Banksian Medal).
An interesting and very commendable collection of vegetables was made by Mrs. Wingereld, Ampthill (gr., Mr. Gourds, Marrows, and two Pumplins, Leels, Carrots, Tomatoe, Celery, Cauliflowers, Cabbages, Onions, \&c., were were included, and some purple Kohl Rabi, \&cc. (Silver-Gilt Knightian Medal).
Mr. Geo. Wythes, gr. to Earl Pescy, Syon House, Brentford, exhibited a collection of salads in twenty-four varieties.
We noticed the Turnip-rooted Celery wao included, besides a We noticed the Turnip-rooted Celery wao included, besides a bunch of the same shown meparately (Silver Baakish Medai),
Mr. Bobt. Fenv, Sulhampatead, showed a dish of Cox's Orange Pippin Apple, and some fruit of his green culinary Apple, called Pay-the-Rent; the latter is a medium-aized fruit, of good appearance,
Some fruits of a good-looking litchen Apple (Continental) gamed Sanpareil were exhibited by Mr. ANTYONY WATERER, gamed Sanepareil will Nuseries, Woking.
Seedling Melons were again shown by Mrs. Wincifield. Ampthill (gr.. Mr. Empson). One of these, Anthony's Favourite, a scarlet-fleshed variety, of very good Havour, received an sward of Merit. Mr. Ower Thomas, Royal Gardens, Windoor, sant a Iruit of a pretty Melon named Frogmore, which the Committee desired to aee again; and fruits of his white fieshed Melon. The Ducheas.
The only collection of fruts on this occasion was one chibited by Mr WxTREs, embracing seventy-sis varieties of Apples and Pears, very commendable in quality, at grown ev near the Metropolis (Silver Banksian Medal)

Thzee large dishes of large excellently-coloured fruits of iascoigne's Scarlet Seedling Apple from Mr. Chiss. E. Sues Foots Cray, Kent, appropriacaly received the Cultural Commeadation of the Committec.
Messra. Sutron
Messrs. Sutton \& Sons, of Reading, and Meamer. H, CANNELL \&oNs, Swanley, ataged harge and mot interebtiog collections of Potatos. The former had representatives of their own raising, incluong mome vary hamisumse need as ulso of the yuaint Frrapple mection. Mever, Caname \& Sons sent anybody's varietien they may grow for trade purposes, under ordiuary field culture, the whited trade purposes, under ordiuary field cultura, the white beautiful Reading colleotioa, comprining virty dishem, there beautiful Reading colleotioa, oomprining birty diches, there Were Ringleador, fleld-grown Ashleu, Early Border, Migoum
Bonum, Triumph, Windwor Castle, Matchless, Sutton's 1 . and others that are now so universally identifed with the name of Sutton. All them ammples w ere very clean and hand some. The Fir-apple eection, so named becanee of the mimi Larity of portione of the tuber to Firrcoves, haviog myrind of deep eyen, and get 00 nice for elicing and frying, were repere sented by the red, white, ad purple-flushel varieties. The The species were represented by tubers of Solsaum Magha, small-coloured; also of s. tuberosum. red round, but yet larger than were the white round tubers of \(s\). etuberosum This is probably but a white form of tuberosum, an at seem to differ chiefly in colour. This collection whas awarded Silver Knightian Medul.
Messrs. Cannell \& Soss' collection, if showing less hand some tubers, at least allowod the varietios to show average
character under field production thoroughly. The white flat round Cometo-Stay, way in fine form, and handsome. This seems to he a first-rate variety. Otbers of kiduey form were Cannell's Victory, Future Fame, The Canon, Cbancellor, Col. Long, Lily White, Soowdrop, Mancrop. Welfurd Park, and National : and of rounds, Satisfaction, Progress, Schoolmaster Paul s White Round, Prodigious. Best AII, M.P.. Abundance c. Of coloured rounds, The Dean, Vicar of Laleham, Purple Perfection, Pink Perfection, Lord Tennyson, Reading Ruseet, Ec. ; and of coloured hidoeys, Early Vermont, Mr. Breese Edgate Purple, Field Marshal (very red), Blue Giant. Prize taker, \&c. The collection romprised 100 rarieties, and was 0 exceeding interest, well meriting the Silver Medal awarded. Mr. Ronfirt FFNn, Sulhampatead, showed a box in partitions, in which were smsll lubers of Solanum Fendleri, of American origia; also tubers, the product of a cross between the specien and a white seedling, Antegomot. Then other and larger tubers, the result of a second cross hetween the product Theue tubers grown a second year will doubtless give a fine and apparently a handsome sample. A cordial Vote of Thanks II as a warded by the committee.

\section*{Lecture on Potatos.}

\section*{Is the afternoon was read a lecture on Potatos, by Mr. As} W. Button of Rending, whose remarke were rendered doubly Kowton had piepred fram photographs takea apecill for this lecture The first portion of Mr. Suttos' lectore for devoted to a reriew of the historical date conpected with the devoted to a rer of the hisorical dati comected with th tuber, which inclinded the reading of extracts from Gerarde and from Loudon's Exeyclopandia, and other muthovities. Mr Sutton declared that every section of the subject of the Potato had been dealt with on previous occasions, and his task wae very difficultome, for but little that wamew coald be mid, oi ther in regard to the botanical characteristics of Solunaman, or the calture of the Potato iteolf.
Then there was the isorasingly-important queation ol disease prevention, which can be trested from at lent \({ }^{\text {w }}\) w chef startiog pointa, either wilh the object of simplifying and extending the French system of apraying the crops when growing with the Bordeaux Miature known as "Bouillie Bordelaise," or of dusting the plant with the same compousd in the form of powder, and thereby aaving from diseave the sorts of Potatos already largely grown; or, on the other hand of introducing to the public not ce varieties obtained by crose fertilisation which may have proved themselves ablo to with stand the ravages of the dreaded fungos.
"On all topics, except the last," said Mr. Sutton, "so much has been said already, that I felt I could not hope to interest yorl With any additional remarks of my own; but as I have lon been identified with the raising and introduction of seedlin
Potatos. I thought it passibie that Im:ght succeed in popu larising this branch of stuly, especially if aided by th lantern views which Mesars. Newton have made for me from photographs taken specislig for this lecture.'
 and berries. he evidontly thinking the Potimto one of the move important and valusble plante of those 80 ably duscribed it the Potato plant on.p. 927 of his work were next given, which, no doubt, represeat the Potato as grown in his garden. These Were followed by the rea
Mr. Suttoe went on to
houghts and comparicone "Thie pictnre' ugmeste mary thoughts a od comparisonf. How littld ow the fae, handsome, and even tubers we see at th:, in
"Then also the use 0 : the Potato in Geparde's time by the wealthy few as a hury of questionable value or utility, how dieferent to the present enormone consumption in all civilinth part of the world

Whil? Gerarde's Potato is before us, it may be interesting
amounted to \(1,232,055\) acres [this year it io \(1,282,768\) acres, vide agricultural returne in Times of October 29], averafing 3 tons 15 cwt .2 qre. 20 lb . per aore, of a total of \(4,662,147\) tons grown in the United Kingdom, besides a large quantity imported (for 1893 the figares ware 14.140 tons). Reckoning the entire population as \(37,880,764\), this would allow about 2 cwt . 1 qr .24 lb . for every man, woman, and child per annum, but these figuree male no allowanoe for the quantity annually consumed in feeding cattle, which is alwayo considerable, and consumed in feedrig catio, to the market value of Potatos.
"My friend Monsieur H. de Vilmorin, has very lindly ment me the figures for France, and he tells me that the acreage ander cultivation is annually about \(3,342,500\), and the total yield for the whole of France is \(10,100,000\) tons, or making allowance for the quantity exported and imported, the figures allowance for the quantity erportad in England, Potatos are grown almost entirely for use as a vegetable, Monsieur Grown almost entirely Vilmorin estimates that about two-fifths or \(4,000,000\) tons are anmually used in France in the manufacture of starch and annuall.

I have also learned from my friend Herr Fritz Benary, of Erfurt, who forwards me vary valuable statistica, that the total acreage devoted to Potatos in the German Enpire in 1893 was \(7.502,165\) acres, and the total quantity of Potatos hosrested amounted to \(32,277,851\) tons, or allowing for the quantities imported and exported, \(32,376,497\) tone, which was the total quantity available.

\section*{inprovement and Deterhoration.}

I think that it would be interesting now to trace the steps by which the great improvement in the caltivated forms of the Potato has been brought about. And here it is necessary to refer to a' misundertand Seed' are often supposed to be one and the same thing. Seed Potatoe may be either a crop of Potatoe grown with the special object of producing tubers to plant again grownollowing year, or elee, as is frequently the case, they are merely the smaller tubera, which, being too small for market, are therefore kept back for planting. Now, it is well-known that Potatos are merely the enlargement of underground stems, shortened and thickened, in which starch is stored up in greater or less proportion according to the several varieties. Like other stems, the tubere produce buds or eyes, and are capsble of re-development by fresh shoots at the axil of the leaves, which in the case of \(u\)
"Although they may be kept through the winter, and planted sgain the next apring, they are in no respect anything more or lees than portions of the old plant which had died down and apparently ceased to exist the provions autumn consequently, while through the almost unlimited prolongatios of the lifs of a single Potato-plant weaknees and dete rioration often set in, there is practically no room for improving the original type by any selection of tabers. This anyone can prove by planting a tuber which may from some cause or other be mig-shapen, and uniform type as the other Potatos which were growing on the same plant. The only modification of this rule I am acquainted with, is in the cases where all the tubers of one plant show a uniform divergence in character, eithor for better or worse. When this is 30 , it is possible that, by the selection of all or any of theoe tubers, a alightly different Potato might reenll, as in the case of some types of the Ashleaf section which are dwarfer and more compact, or else taller and coarser-growing then others. Outaide the Ashleaf clase, however, I know of no such instances.

In reference to this point, Monsieur Vilmorin mentions he does not consider a really first-class seedling Potato is liable to degenerate so quickly as is generally supposed. If degeneration sets in soon after ite introduction, it merely proves that the rariety is one which never ought to have been brought to public notice.
" Potato seed, on the other hand, is totally distinct in every way, being the seeds formed in the Potato berries which some, though not all, varieties of Potatos bear so freely.
Views were then shown of some of the berries in their natural condition, and also cut to show the arrangement of the seeds within the berries " 4 berry," said Mr. Sutton, "may coatain from 100 to 300 eceds-the average of five borries examined being 232 :-and as the parent plant appears able to control but ulightly the distinctive charecter of it progeny, and as all the difierent soedlings from one Potato boery may produce plants differing from one another, not only the great powaibilities form in colour alno, it is here we find the better seedlingo. Even if no crov-fertiliontion of flowerm wae attempted, great improvement migh's be made by the selection of the most promising seedlings daring the first few years of "their existence; but where judicious crossing of the best known varietiesjis undertalren, we can in a great measure combine in some of the resulting seedlings the merits of both male and female parent, although, evan then, no two seedlings trom the same berry may be exactly alike.

\section*{Seid and Segotres.}

Anyone attempting to raie seedling Potaton must have abondanee of patience. Like many other wpecies which are not habitually multiplied by the seed, the Potato has a remarkable teadeney to revort to the wild form. It may be necomy to caltivule 100 cr even 1000 seedlings before finding at which ic relly worthy of a plece amongat the better
arietiesiruedy exinting. Xonna, Vimorin axys that in France Whe niniag of reed Potation has been proceeded with in as some hoid, inore ryutrantic methed hase bon followed, mentioning
ing disease, with little tendency to develop haulm, are the characters we generally seel. Unfortanately, he says, they are not alwa ya able to profit in France by progress realised in England, because the French have a marked preference for Potatos with yellow flesh; whereas in England, for many years past, there has been a preference for whitefosned Potatos. On thish mouse had the honour of introducing in 1876, after having enjoyed a brief popularity in the Paris markets, has been almost abandoned as a table varisty on account of the flesh being too pale in colour. Mons. Vilmorin remarks that in Germany considerable attention has been given to raising seed Potatos, out more particularly with the object of raising varieties which are specially adapted for the production of alcohol and starch.
The next three views represented the pistil, after the anthers had been removed, to prevent self-fartilisation, then e arrangement of anthers around the stigmas, both closed and expanded, and then the inner surface of three anthers and

Species and Varieties.
A Potato Seedling at 'the end of the second year, and another at end of the fourth year, were next illustrated, after which Mr. Sutton had a picture of Solanum etaberosum, but remarked that "he had not noticed anything in this Potato either denoting that it was deserving of cultivation on its own account, or for crossing with the ordinary Solanum tuberosum, which it seems so nearly to resemble."
The "Paps Amarills" was then shown. This is much grown in Pert, but Mr. Sutton after carefully growing the variety for eight y ears, is of opinion that it is of no use in this country.
Representations were then given of a variety found growing South Africa, which after being grown at Reading for seven years, Mr. Sutton describes as distinct from all Potatos, and as being free from disease until 1894, when it suffered
badly. Another one found growing in the Rocky Mountains, almost the counterpart of the large white Fir-apple Potato very much diseased in 1894, and the red and white Fir-apple varieties.

Other intereating representations followed, inc luding the Black Congo Potato, the dense purple of which renders it useful for ornamental cookery.
Another variety, grown much in Norway. It has been considered valuable for the supply of so-called new Potatos throughout the year. The tubers are seldom larger than an Almond, and by lifting the crop before it is quite ripe, the close texture peculiar to new Potatos is retained indefinitely.
Slides 22, 23, and 24 represented plants taken from Mesars. Suttons' trial-grounds. Owing to an injury to the stem, the plants were unable to produce tubers below the surface of the ground, and did their atmost to make up for this failure by a vigorous attempt at tuberation from the axils of the leaves,
Other pictures represented a spray of Solanum nigruma
and berries of the Bitter-sweet (Solanum dulcemara), and the deadly Nightehade (Atropa Belladonna). "There were 700 Solsnums," said Mr. Sutton, "of which only six kinds were tuberous-bearing.
Slide 28 repreeented flowere and foliage of Solanum Maglia, of which Mr. Sutton proceeded to say:-"Chiefly on account of the fact thes the dreeded Potato fungus produces most havoc in damp, wet seasons, it has been very much hoped by Lord Catheart that if hybrid seedlings could be obtained between the Solanum Maglia (whose habit was that of lowlying marshy places near the cosst of the Islands of the Chonus Archipelago) and the Solanum tuberosum, which most writers consider a native of the higher slopes of the Andes, a new race of Potatos might be secured which would resist disease ; but here I may say, in parenthesis, it is not at all impossible that Solanum tuberosum may ihave had its origin as a littoral plant rather than a species of elevated or mountainous repions, which thought is streagthened by the fact that Potatos flourish so amazingly on the warp-lands of our eastern sasboard. Although many huadred flowers of Solanum Maglia were artificially fertilised with pollen from cultivated varioties only five were succeseful, resulting in five seed-berries, and out of these seed-berries only two seedlings were secured, and only ane of these showed any promise whatever, the second requiring to be grown under glass to prevent its dying away.
"glide 29 showe the tabers of Solanum Maglia, and 1 regret to say that last year, in 1894, the crop was almost entirely deotroyed by disente out-of-doora, some indoors boing froe.
- glide 20 shows the hybrid seedling just referred to, which, although a vast improvement on the Solanum Maglia, is very far behind the ordinary cultivatod Potato both in appearance, crop, and qualities. This seedling has now been grown for eight years, and in 1891 the crop was slightly diseased: proiously it had almost escaped.
"The next few slides illustrate some of the highest types of seedling Potatos which my house has had the honour of introducing to the public, the crosser having been made in the majority of cases by the late Mr. Clarke, so well-known as the raiser of Satton's Magnum Bonum Potato, and two by Mr. Robert Fenn, one of the oldest and best authorities living on the artificial erossing of Potatoo. Thoy are \(\Delta 1\) Early Regent, Trinnaph, Satisfaction, Satisfaction Potato a lifted, Magnum Bonum, Flourball. I must not conclude without relerring to the of the Boaillie Bopdelaice an application for preveating Potato disense.

\section*{Dinease and sprayine.}

Slide No. 42 shows two plote of Eutton's Maguma Bonum Potato growing wide by side during the past nesson, that on the left hand wide having been aprayed three timee and that on the
right hand not having been aprayod at all. It will be soon thit the reault was very marked, enabling the plants where eppayed to continue in growth some time after the unsprayed portion had died down, and the weighte of the two "plots when lifted were as follows : - The sprayed, 3 cwt .1 qr .23 lb ., and the an sprayed 3 cmt .1 qr .4 lb . Strange to say, the quantity of 4 lb . The question really remains wheth both ploth vix, weight par acre would compensate the grower for the someminh laborions task of spraying his crop three times during the growing period
In a most elaborate series of experiments I have cooductal this year in conjunction with Prof. Gilchrist of the Uniremith Extension College, Reading, we have found that in the lat and second early varieties there is no advantage from sprying, as these had finished their growth before any disease coold attack the plants, and the dressing did not lengthem appors ciably the period of growth. Undoubtedly in some sorts wheh are peculiarly liable to diseass, especially when arown in gardens, a judicious application of the Bouillie Berdeline
would secure even in bad disease years a crop of somnd Ponta,

\section*{[Grafting the Tomato and Potato。}

Mr. Sutton then reforred to sora interesting eapperimentes (1) a bunch of Tomato flowers; (2), bunch of Tomito flow and berries greatly resembling Potato flowers and berries: (3), a photo of the Tomato plant by Gerarde in 1507. Thil wis

Mr. Sutton then procoeded:-"slide 46 reproseats our Tomato and Potato graft. One tuber was planted in mod pot on March 22, and when about 4 to 5 inches high tho plant was cut off half an inch from the level of the soil, and a gnith of a Tomato plant introduced on May 8. The result of this has been that the Potato, nourished by the Tomnto plant sboveground, has produced a crop of Potatos in the pot, w wround hase produced a fairly good crop of Tomatos, nourinhed by the Potato roots in the pot.

Slide 47 is the same process reversed. The Tomato plant was cut off half an inch above the surface, and the Potato grat introduced. The Tomato roots have not, of course, produced Potatos, bat the Potato plant above ground produced one tray of flowers and seven berries ; and in order to extend this somo what interesting experiment, the Tomato flowers have bow fertilised with Potato pollen, and the Potato flowers with Tomato pollen for farther experiment next year. These plo tographs were taken on August 14; but on looking at the plants recently, it was found that two of the Potatos groming on Tomato stalke appeared suddenly to be aware of the foot that, although producing flowers and berries, they had not yot produced tubere, and it being 'never too late to mend, they have, as you will see in alides 43 and 49, produced taben in the axils of the leaves and stems.

\section*{Some discassion afterwards took place.}

\section*{NATIONAL CHRYSANTHEMUM.}

Octorse 23. -The Floral Committee of the abovt Society met at the Royal Aquariam on the abore date, under the preaidency of Mr. Thoman Beran, a conaiderable number of noveltien being ataged So plentifal, indeed, have new productions become and so mach alike are many in goneral charactas to varietier already in cultivation, that the Socioy does well to be sparing with certificates, which ar given only to varieties of decided promise aftar their claima are well connidered.
On this occasion First-class Certificatos wrere awardad to Edith Tabor, a highly-promising clear pale yollow Japanew, reflexed like Sunflower, having lonk basal florets, from R. C. Notcott, Ipewich ; to Mrs. Charles Blick, a large pur white, the fiorete narrow, and slightly groored, from Buicr, The Gardens, The Warren, Hayes ; to Dorothy seme the surface of the petals bright reddisb-chestnut, with amber reverse, very attractive and bright in colour; to J. Shrimpton, of a very pleasing orange-amber shade, hers and to there streaked with reddish-crimson-novel and dirin the floots John Seward, ciear medium gellow, large and fal, long and drooping, and somewhat broad; tho thro then were from Mr. Whula M SEw 1 RD, The Firs, Hanwell, the rim of several fine varietio. To Lady Byron, a large whito Ja of considerable subetance, said to have come from ar between Paritan and Mre. Alpheus Hardy, Lom Picinise WeEks, Thrumpston Hall, Derby; to Yompon . Bassoos one of a batch of charming varieties raisod by in colour, fine in shape, small, compact, and very plessing; to aingie, Annie Holden, a sulphar-oloured aport from Mary Andew which is white, and which appears to have al qualities of the latter, from Mesers. H. Carresti \& somb Swanley; to Japaneee, Ethel Addisoz, a broed-p bright rosy violet in coloar, with a silvary
promising; Fmily Spilebary, largs and full Japanese, of excellent form and pure in colour, D. B. Crave, colour deep gold, a flowor of f. In. Ryecroft Nursery, Lowisham; to Japanove, a bold and massive brosd-petallod white loo, Beckert. The Gardens, Aldenhare House,

In Mr. B. IRONSIDE's collection of novelties were Japanese Milano, orange and reddish-cerise, with a golden rovereo, hsving a rare metallio lastre, very promising; and incurved hsving a rare metallio lustre, very promising; and incurved
C stagnola, bronzy chestaut, also very promising. Japanese Csistagnola, bronzy chestnut, also very promising. Japanese
Mons. George Biron, pale chestaut, with ailvery reverse; and Mons. Georze Biron, pale chestnut, with a vilvery reverse; and
Beauty of Teignmouth, an American varisty, vivid vermilioncrimson, with silvery reverse and massive petals, both from Mr. W. J. Goderey, Exmouth, are also very promising.
Japanese tridu of Madford, from Messrs. H. Cannell a Sons, the committee wished to see again; and they al:o had in very fine character Globe d'Or, a new incurred flower, certificated last jear. Japanese Mons. B. Girond and Mons, G. Montigay did not succeed in obtaiaing a wards, though much fancied by som?. Japanese Mdlle. A. de Galbert, a large white, from Mr. H. Shoesmite. Woking; and Japanese O. B. Haywood, from T. B. Haywoon, Esq., Woodhatch, tho committee wished to see again.

October 28.-A meeting of the General Committee wat held at Anderton' Hotel on the above date, Mr. B. Wynne presiding. The Secretary reported the amount of priz8-money awarded at the October how, all of which had been paid; and the awarda of medal by the Arbitration Committee to miacellaneous collections was also approved.
Complainte having been made as to the imperfect lighting of the Royal Aquarium on show days, the Secretary wae instructed to address a strong and urgent remonstrance to the Directors in favour of an earlier lighting-up, and a greater volume of light, members having complained of their inability to satisfactorily examine the flowery during the afternoon. An interim cash statement of a very satiofactory character was made by the Secretary, who also gave an interim Jubilee report of an encouraging character, the Secretary being instracted to issue the prelimiaary schedule of prizes. It was resolved that, following the practice observed in the csse of the Centenary Celebration ia 189), a Bronve Jubilee Medal should be given to every Sosiety in affiliation with the National Chrysanthemum Society during 1890. The Secretary reported that the annual dinner would take place at Anderton"s Hotel on Wednesday, November 27, the President, Bir Edwin Saunders, in the chair. Twenty-five members were elected, including two Fellows, the number who have joined since the beginning of the year being nearly one hundred.

EHIRLEY AND SURROUNDING DISTRICT GARDENERS' AND AMATEURS' MUTUAL IMPROVEMENT ASSOCIATION.
October 25 aND 28.-Two meetinge, held under the euspices of the Hanta County Council, were held on the above dater, Mr. E. Molyneux, of Swannore Park Gardens, addressing each meeting.
The first was held at Highfi eld, Southampton, and the subject was "Hardy Fruit Culture for Cottage Gardens and Allotments." There was a very creditable display of fruit, and the lecture was of a most instructive nature, all the principal points, such as planting, training, grafting, and pruning being fully explained.

The meeting on the 28 th was at Nursling, South ampron, and the "Caltivation of Fraits and Vege table for exhibition, with Hints on Packing for Transit," was the anbject of a very able addrens.
The rarieties of vegetables and fruits most desirable for exkibition, and the character of the specimens moat likely to win prizes, were given. The largest specimens in many cases do not obtain prizes at shows, and the lecturer endeavoured to impress on the minds of his audience that something more than mere size should be aimed at to ensura success. There was quite a show at this meeting of high-class fruit and vegetables, made entirely by the gardeners in the locality, and there was also a good attendance. Hearty votes of thank were accorded Mr. Molyneux at the close of each meeting.

\section*{FRUIT EXHIBITION IN DARLINGTON}

October 24 and 25.-This exhibition, in connection with the Gardeners' Inatitute, was held in the Mechanica' Inatitute, on the above dates. It is seldom that fruit attains sach perfection in Durham and North Yorkshire as it has done this season, and the apecimens exhibited by local growern, both for aize and colour, were ach that might have made the growers in the southern counties envious.
Specimens of such varieties of Apples as Warner's King, Bismarck, and Peasgood's Nonsuch were exhibited up to 18 oz. is weight; while the bright colours of Mère de Ménage, Baumann's Red Reinatte, Reinette du Canads, Scarlet Pearmain, \&c., drew forth exclamations of admairation and wonder from all who taw them, many expressing themselves surprised that such splendid specimens could be grown so far north.
In the Pear section, Pitmaston Duchess figured most promirestly, but there were also some very good specimens of Bergamot d'Esperen, Beurré Diel, Louise Bonne of Jersey. Bergamot d'Esperen, Beurré Diel, Louise Bonné of Jirrey, Darondeau, Catillac. Doyenné du Comice, Beurré Clai

The nureery trade was well represented by Mesers. Kent \& Brydon, Darlington. BaOKirouse sor, York, and T. RIVERS \& Som Sawbrtdgeworth, all of whom staged large collections. and their oxhibite were of a most meritorious character.

The varieties reost noticeable in KruT \& Baypor's collection were, stirling Castle, Collini, Lord Lonnoz (ot excoptionally were, Stirling Castle, Collini, Lord Lonnoz (ot exotptionally thoradon, Brownleo's Bumet, and Cox'I Orango Pippin. In Backrouse \&on's, Peaggood's Nonsuch Gromup's Pippin. Rose Hill, Annie Rlizabeth, Lady Henniker, and Wintar Queening. In Rivers a Son's. Wadhurst Pippin Pitmaston Pine, Mero de Ménage, and Nelson Codlio Apples. The other exhibitors were Mp. WM. Smrra, North Rise, Darlington; Me. J. McIndoe, Hattoa Hall Gardens; Mr Temple, gro to 8ir David Dale, Weat Lodge. Darlington Mr. Hy. Joheson, Elm Ridge (gr., Mr W C Barron), Dar Mington; Mr. Mackar, Darlington: Mr. Doualas, gro, Bollington; Mr. Mackay, Darlington: Mr. Douglas, gr., Bol-
dersby Park: Mr. J. Hornby, Healington Hall Gardens ; Mr. dersby Park: Mr. J. Hornby, Howingtor Hall Gardene; Mp.
Hamain, Rounton Grange Gardene; Mr. J. McImtybr. Haxagan, Rounton Grange Gardens; Mr. Jo Mcimtyem. Mallabar. Hummerdenote; Mp. Hy. Wamd, Brinkbura Gardens: Mr. R. Simpson, Pilmore Hall Gardeas: Mr. J. Lee, Clifion Castle Gardens; Mr. Peel, Bloydon-on-Tyne and Mr. Surfield. Stoke Prior Taere were alno nome apecialties in regetables exhibite t, most noticenble being a Kueller, gr. to the Marguls of Ripux, Studiey Royal, Ripon.
The exhibition was visited by a great number of people, and the Secretary (Mr. J. G. Wilkinson) and Committee are to be complimented on the euccess which attended their offorts in getting together such a large and interesting display.

\section*{THR PABT WEEK}

THef following summary record of the weather throughout British Iolands for the wreok ending October 28, is furnished trom the Meteorological Office:-
-The weather was fine and dry generally at the commence ment of the week, but an unsettied condition 500 n et in with frequent showers of rain, hail, sleet, or now in the with frequent horthent, and this extended later on to almost all parts of the Kingdom. The showers were, however, heavier and the Kinguom. in the northern and western districts than else more frequent in the latter part of the week thunder and where. During theng were expanced in various parts of the country.
lightning were exparienced in various parts of the cime of year
"The temporaturs was nnusually low for the time of year. ' Bogland, E. and Ireland, N.." to \(8^{\circ}\) is "Englend, N.W. and Irelend, \(S_{\text {. }}\). The highest of the maxima occurred on the 20th
 and England, *iE. The absolute minims were recorded and England, No the of the period, ad were extrumely lew for the
time of your. They ranged from \(18^{\circ}\) in "England, B.W: (at Laadovery), \(21^{\circ}\) in "Eogland, Ben' and \(2 x^{\circ}\) in the "Midined Counties, Bootland, W. and Irelasd. 8." to \(29^{\circ}\) is 'soothead, N. and E.. \({ }^{\circ}\) and to \(37^{\circ}\) in the "Channel Iolandn.' The loweet seadings reported from station with a chermoracter exposed on the grase were \(13^{\circ}\) at Worksop (both on Thurseley and Saturdeg). \(16^{\circ}\) at Loughborough, \(18^{\circ}\) et Cillorwx, and \(90^{\circ}\) at Oxford and Cullompton.

The rainfal varied very greatly ie difterent perts of the Kiogdom, but whe, on the whole, in exove of the mest over 'England and Scotlend, E.,' and juat about the normal fleowhere. The fall consinted mainly of hail, aleet, and anow in the western and northern dintrict.

The bright sumshise was more prevalent in the weat and mouth-weat, and in 'Eagland, N.E." than elnewhere. The percontage of the posible duration ranged frow is in "Irelund, \(\mathrm{E}_{\text {ep }}\) " 4 in tho "Ohannel Ielands, 43 í "Ireland, Xow and 41 is 'Eagland, Eop to 25 in the 'Midland Coueties.' ead 93 in ' Englaud, N.W

Paize Ebacy.-The prize offered by the Royal Horticultaral Society for the beat ensay on "The Commercial Aspect of Hardy Fruit Growing in Great Britain," were presented at the meeting on Tuesday lat, by Sir A. Abbuthnot, in the anavoidable absenca of Sir Taevor Lawremen. At the jadgen were anable to decide between tro of the paperssent in, the Council have given \(£ 15\), inatead of \(£ 10\), and this bas been divided equally between Mr. Lewis Castle and Mr. S. T. Waight, gardener at Glewaton Cuart, Herefordehire. Dr. Hoag hat also presented a large Silver Medal to both enayiats.

\section*{SEEDS.}

Lonpoz: October 30.-Meesrs. John Shaw \& Sone, Seed Merchants, of Great Maze Pond, Borough, London, S.E., report to-day's market thinly attended, with but little businees doing. Rather more attention latterly been given to Clover seeds, and the impression widely prevails that the lowest prices possible have been reached. Winter Tares are slow this week. There is no change in Rye. New Haricot Beans on the spot, being in strong demand, and almost unattainable, have again adranced several shillings per qr. Blue Peas also sell freely at rising quotations. The new Hemp Peas also sell freely at rising quotations. The new Hemp Canary seed is steady. There is no alteration in either Canary seed is steady
Mustard or Rape seed.

\section*{FRUITS AND VEGETABLES.}

Boroual : Oct. 29.-Quotations:-Cabbages, 2s. \(3 d\). to 3s. 9d. per tally; Carrots and Turnips, 2s. to 2s. 6d. par dozen bundles ; Apples. 3s. to 6s. per bushel ; Pears, 3s. to 7s. do. : Chestnuts, \(6 s\). to 8 s . per balket ; Walnuts, \(4 s .6 d\) o to 8 s . per bag.

\section*{ENQUIRY.}

He that questioneth much shall learn much."-Biodr.
Will some of our Danish correspondents kindly inform "Hibernia" of the meaning of the word Traateen, as given to an Apple; a new variety, said to be the finest in existence, with this name, having been introduced to the gardens of the Prince of Wales at Sandringham in 1893.

* Owing to the large increass in our circulation, we are under the necessity of going to press some hours earlier. Our as early in the week as possible. Communications should reach us not later than Wednesday.
Cattleya labiata Blooms: W. Bull. One of the richent coloured varieties ever seen, and the flower of more than fair size. The other exhibits an attempt on the part of the flower to produce two extra lips out of what are really the sepals.
Erratum: The large Pear from "F. H.," inadvertently named Bachess d'Angou éne in this column last week, hould read Pirmaston Duchess. Frut Culture in South Africa: H. F. T. You should write to Mr. Cooke, Ravenscourt, Bexley, Kent, who has information to impart.
Insects: \(F_{0}\) A. The grabe appear to be those of the nmall cockchafer or Fernchafer (Rhizotrogas solatitialis). In the case of the lawas, you might try copious applications of diluted gas-water. As to the Begonia beds, dig ap and carefully hand pick and deatroy all grubs and affected tabers; gas-water might then be applied, or the earth be removed, and replaced by fresh. \(R . M_{c} L\)-W. \(R_{\text {a }}\) The insecte are the grabs of one of the boring beetles, which are often imported with Orchids. If the parte affected by them are cat off and burnt, they are eavily got rid of
Mushrooms Turning Brown when Quitr Small \(F^{F}\). B. This may happen when the soil and bed are deficient in moisture, as will often occur when excessive heating has taken place. The "spawn" will sometimes be injured by the great heat, and vegetated but weakly. Loas of heat in the bed will arrest development in the Mashrooms. Without seeing the bed, and knowing more of the treatment afforded, we are anable to say what is the exact cause
- Plants, Fruits, Exc., to blit Namrd.-The applications to nume flowers, and especially fruit, are so numerous at this season as severely to tax our resources. They entail \(n\) expenditure of time, labour, and money, of which our readsrs have no ider. We are always willing to oblign our correspondents as far as wec wh but the editing of the \(G\) trdenors Chronicls is our business, to which everything else must give way. that not more than six specimens rain be dealt osith at the If more are semt, it hoond bs araceful act on the at a time. more are sent, is soou a ba aracegul act on the part of the Orphas Fund. Correspondents sending plants or frwits to be named, or asking questions demanding tims and ressaroh for thetr solution, must not expoot to obtath an answer to thein enquirtes in the current week. Speoimens should be good ones, arefully packed and numbered. Leavss only, or Florists varie. ties cannot, as a rule, be named.
Names of Fruits: Houston. 1, Eater Bearré; 2, Vicar of Winkfield; 3, Pasae Colmar; 4, Beurié d'Aremberg.-M. P. R. 1. Cox's Orange Pippin; 2, Small' Admirable; 3, Beurré de Capiaumont other Peare over-ripe.-Camans. 1. Gloa Morcian; 2, not known-worthiess.-Charles J. W. Your Apple in known as the Black Crab.-H. F. 1. Beurré Rance: 2. Vicar of Winkield: 3, Pasee Colmar. - \(B, R, S, 1\), not known-a wild variety 2. Crimson; 3, Pott's Seedling;-W. Hunt. Charle ville. 1, Cox's Orange Pippin; 2, Cox's Pomona; 3, not known; 4, Waraer's King; 5, Ribston Pippin; 6. Yorkohire Greening.-Kent \& Brydon. Your Apple is inferior to handreds of others in cultivation,-Rev. C. O. Pearn, 1, Uredale's St. Germains: 2, Verulam, both excellent atowing

Names of Plants: Correspondents not anowered in this issue are requested to consult the next number. Mells Park 1, Uratæ 5 as crus galli var. apleadens 2. Ora'zjas puactata; 3, Pgrus pranifolia; 4 Cratægas coccinea var. macracantha; 5, Cratagus coccinea. - Gurteen. Prunas Padun (Burd Cherry). \(-S .1\), Gulacrites tomentosa; 2, Lathyras Cif. menam; 3. Sclerolepis varticillata; 4 Hamamelin virginica, very untimely in flower,-E. J. Pajicam capillare.-J. D. 1, Nerine coraci major: \(2, \mathrm{~N}\). sarniensis ; 3 , the large form of N . hamulis, or a hybrid of it; 4, N. ronea.-W. C. R. I Fankia obcordata; 2, Calycanthua procoz, W. F. M. 1, Dendrobium album (aqueum); Trichouma mavia; 3, Ealophia megistophylla, 4 ; Adiantam caspidatum; 5, Adiantum maer phyllum.-J. D. Next week, - \(R_{0}, B_{i}, L_{1} \& \mathcal{S}_{0} 1_{\text {, }}\) Kadsura japonica variegata; 2, Siphocamppla bicolor; 3, Mentha pr., end when in bloom; 4, Saintpaulia ionantha.
Neapolitan Violets in Flowbr by Chbimas: H. May. It cannot be done, except under exceptionally favourable circumstances, and by a apecial treatment of the young plants. Natarally, thin variety is later in flowering than Marie Loaine, The Czar, and Victoria. Very little warmth is required by Violets, a day temperature of \(45^{\circ}\) to \(55^{\circ}\) or \(60^{\circ}\) by sunhest, and \(45^{\circ}\) as the minimam by night suffice all through the winter. The plants are impatient of a close atmosphere, and require air whenever it can be safely afforded.
Pelargoniums and Fuchsias: Flora. The firt-named may be kept in a sunny window, and afforded wator only when the soil geta almost dust-dry. Do not prane till Febraary, nor use saucers under the pots. The Fachaias may be kept in the cellar if it be dryish, or similar place, and be cut back or cut right down in March. Cattinga of Pelargoniami would root now, and you may aucceed with Fachais if the cuttinge are placed in sandy soil covered with a glaes.
Raspberries in Fruit: \(W\), Jones. By no ment anusual before the frost came.
Rhus succedanea: Munches. A amall Japanese tree with amooth branches and leaves, the latter boing pinnate, and consisting of fifteen shining gretl leaflet. So far as we know of, it has no other name outaide of Japan.
Rose Leaf Caterpillat: W.P. For clearing bubber in the R one-house, Richard's XL might be tried instead of the time wasted in hand picking. Oat of doors you could use quassia water, soapsuds, and tobacco water-the lacter not made at home from good tobacco, but purchased at the tobacco mana facturers, which is much stronger and conequently economical. The proportion may be one uf the juice to twelve of soapy water. Thew washes do not kill, bat they make th
Roae unpalatable to the caterpiliar.
Tomato: Market Gardener. Not burning from bed glass, but a fangus disease-Cladosporium lyco peraici. Cat oft and barn all affected fraits, and apply the Bordeaux Mizture. See Gardenorr Chronicle for recipe for making the ame in "Aaswers to Correspondents" on Jaly 27, 1895.
Worishop axd Factory Acts: A. T. B. Send to Mesarm. Eyre \& Spottiswoode, Queen's Printert East Harding S.reet, London, E C., for a copy o the Act. It will cost but a triting anm.

begs to say his preliminary list of chrysanthemums is now ready. This is a carefully-prepared Alphabetical List of the oream of recent introduotions, so far as in commerce, free from sensational and unnecessary long

\section*{SPECIAL NOTICE.-GRAND NATIONAL JUBILEE SET OF NOVELTIES.}

Soon as the shows are over I shall prepare a LIST of NOVELTIES for 1896. This List will be a short one, as I am anxious that the set shall be composed of nothing but back row flowers of the choicest description. Several of my purchases have already been shown in public, and reaived unanimous approval. In addition to the beautiful varieties raised by Mr. H. Weeks, of Derby, and two exceptional sterling Novelties from America, \(t\) is with great pleasure that I am able to announce that I have made arrangements with William Seward, Esq.. of Hanwell, to distribate his set of : x magnificent seedlings, which have justly been the admiration of all who have been privileged to see them. The whole of these will form a grand Yibilee Set, worthy of the occasion, and undoubtedly the finest collection of Novelties ever introduced.

\section*{}

FAY'S NEW PROLIFIC
The largest fruited and most prolific of all Red Currants. Excellent for table use and for wine making.
MOUNTAIN GOOSEBERRY. - The best of all Gooseberries for wine making. Excessively prolific, and of vigorous growth in almost every soil.
LILACS. - Double and Single-flowering. Splendid varieties.
RICEARDIA (CALIA) LITTLE GEM.
The true variety.
IRIS KTEMPEERI.-Most splendid; flowers
7 to 8 inches long.

SATURDAF, NOVEMBER \(\cap, 1895\).
MELVILLE CASTLE.

0NE of the most delightfal excarsions from Edinburgh is that whioh embraces the olassic and oharming vale of the Esk-Roslin, Hawthornden, Melville, Dalkeith, Newbattle, Dalhousie, are so many shrines in what one might oall a hortioultaral pilgrimage. Influenced by the fasoination of lovely grounds and gardens, and held fast by the hospitality of Lord Melville's faotor and general manager, Mr. McKinnon, we devoted the major part of our afternoon's trip to the enjoyment of the besuties of Melville. As soon as you pass within the gate of the noble park, you are struok with the marks of the interest, care, and taste devoted to arboriculture on the part of the owner. His lordship is a keen arboriculturist, as the frequent strips of young plantations, contrasting with the grand stretches of Oak and Beech, testify. For \(1 \frac{1}{2}\) mile the Esk meanders through as oharming a piece of soenery as the eye need desire - meadows intersperaed with magnifioent ornamental Limes, Soottish Elms, Beeches, and Oaks, and flanked by heavily - wooded heights on either side. These Beeches and Oaks are classio, if one may judge from the frequent quotations from Sir Walter Scott, with which our guide enlivens the stroll. Unfortunately, the effects of storms and old age have made themselves apparent in frequent gaps; but these ravages have given scope for the enterprise of both owner and manager, with good effeot in the present, and the hope of great things in the futare. A glanoe over the fields stretching away to the right, and forming the home farm, talls us that Lord Melville is likewise an enthasiastic agricultarist. The crops are heavy, and give expression to the fertility of the Melville estate. A oonsiderable stock of Highland cattle, Ayrshire cows, and sheep, add to the anrieties of the manager, and, like everything else, they are in prime condition.

Half-an-hour's stroll bringy us to the castle, an imposing turretted mansion, commanding a fine bit of the Esk, and surrounded by lawns and shrubberies, rioh in ornamental trees. The extansive breaks of Rhododendrons, many of them added of reoent years, must have a striking effeot in the early summer. The size of some of the Beeohes and Oaks in the environs of the oastle remind of the remote historio prominenoe of Melville. It has its Queen Mary's Oak, and its pre-Reformation shrine; and, still more interesting, it is assooiated with the great Henry Dundas, the friend and colleague of Pitt, and one of the most distinguished and popular of those potent individuals of a past generation, who went by the sobriquet of "Kings of Scotland." His monument in St. Andrew Square, Edinburgh, is the tribute of Scotland to his varied services and
gifts. Besides being associated with the memory of Queen Mary, the annals of Melville proudly reoord two visits of royalty within the century. Genrge IV. was here in 1822, Queen Vietoria in 1842.

The next or jact of interest is the gardenp. Melville's fame hat long been eminent, and deservedly s. The Grapes grown here for the last twenty
yeara have been the admiration and the envy of many a far-travelled visitor. A long record of prize-taking, which hat of late, owing to the multifarions engagements of Mr. McKinnon, been discontinued, atteats to the great thinge they have achieved in competition at all the more important exhibitionf.
A look at this year's crop is aufficient to prove that the traditions of Melville in this reapect are well maintained, and to induce regrat that Mr. McKinnon resiats all our argumente to appear once more in the lists. The firat house we entered was a late vinery, containing Alicante, Lady Downs, and Grow Colmar. The large size of both berry and bunch, and the presence of excellent colour and finisb, indicated both care and intelligence in rearing. The same featares were obervable in the next two houses, devoted to the caltare of Black and Golden Hambargh, Gros Maroc, Mascat of Alexandria, Mrr. Pince, and Madrenfield Court. The Golden Hambargh were apecially magnificent, and the akill of Mr . McKinnon and hit able chief assistant, Mr. Black, have been particalarly successful in bringing near to perfection the crop of Madresfield Court, which have a tendency to crack, and are very difficult to finish.
Two other houses are devoted to the rearing of early crops, and from the finished appearance of the banchen left, give every indication of health and vigoar. Several other houves are devoted to Peaches, Tomaton, Fige, Plams, \&ce, and are aimilarly indieative of the revaltes obtained by able management. Whether regard be had to the sizs or to the filavour of these fruite, it is sufficient to *hy that they are fruit-rearing here, and one which owes its initiation and perfection to the present manager, is the gplendid collection of frait trees in pota, which crowd other two large houses. A large crop of Apples, Peart, Piumb, Cherries, \&c., is annually prodaced, which may challenge comparison with that grown ander the most favourable conditions of climate, soil, and sets us marvelling at the resources of the gardening art here brought into play.
Tarning from frait grown under glase to the fruit and vegetable gardens, the reaulte this jear have been romewhat disappointing in the case of Apples and Pears at least. The fact that June was excessively dry in this part of the country, combined with the sandy nature of the subsoil, blighted the early promise of a large number of treen. Otherwise, the appect of these gardens revesl a good average crop of fruit and vegetables. There is a specially fine lot of Morello Cherries.
The exhibition of flowering plants in the conservatories and flower garden maintains the tradition of former years. Oas of the former, whoso roof is hidden by a mass of Tacsonian, Fuchrias, and Clematif, contains a mixtare of greenhoune plants, sill in prime condition. The broad bordera of the walk in front have long been remarkable for the collection of herbaceons flowers, embracing many rare specimens. A number of bedu in front of the Palmhoure, ablaze with Begoniar, give a very atriking effect of brilliant colour to this part of the gardens. They bave been found to atand the rainy weather of this damp climate better than Pelargoniums, and the heavy rains of the month of Jaly have enabled them to recover from the drought of June.
The flower garden comes last, bat it is not the leant characteriatic of the beauties of Melville. It reveals a fine combination of taste and intelligence. The long rich border of Phloxev, Peatatemons, Antirrhinumes, \&ce, backed by a high wall ablaze with variety of creeping plants, combines nym-
order of the day, and in addition to many gems of their kind, we were apecially struck with the graceful effect prodaced by a frequently recurring one composed of Begonias, Gladiolus, Lobelia cardinalis, and Dactylis glomerata. The plan of devoting the centre beds to plants of tall growth, serves admirably to break the monotony and artificialnens of the conventional flower garden, and contributes to create the impression of the presence of Natare rather than the hand of man. The whole is finely set off by a border of Rhododendron, mixed with golden Eider, Retinosporas, \&c., and rans along the lefthand side. Tourist.

\section*{BEGONIA DISEASE.}

Coutivators of tropical herbsceous planta, ach an Gloxiniae, Achimenes, Pentas, Impatiens, Vincar, and especially Begonias, are more or lens familiar with a "disease" which attacks these plants, sometimes crippling and practically destroying whole batches of them in a few weekn. It attacks chiefly the young leaves and flower-budy, causing the latter to wither and fall off, and the leaves to carl and become aborted. When the disease is bad, the youngent leaves are arrested in growth when very mall, and the whole plant soon presents a hopeleanly crippled appearance. The leaver are diacoloured with patches of a black or brown colour, as if suffering from a rust-fungus of some kind.
The general imprestion with regard to the nature of this diseave is that it it fungoid. Attention was called to it recently in these pages in a paper on "Taberoas Begonias," by Mr. W. W. Sheath (see pp. 267, 263), who etated that " Pot-plants (of Begonias) are sometimss infested with a kind of rast on the atems and leaves, which nome growers ayy is a fungus, but I have found it more prevalent when in too much heat in apring; also by audden changen of temperatune or dranghte; by imperfect drainagein fact, by anything that wonld canse a check in the growth." Oa p. 305 there is a note signed "W. K.," wherein this disease is attributed to "large numbers of white insecte, barely visible to the naked eye." Another correapondent, however, "H. W. C.," who says ( 0.337 ) that he is an extensive geower of \(\mathrm{Be}-\) gonias, does not believe that the mall white insects are the cause of this rat-like disease, but inclines to believe that it is caused by a fungan.
A similar discassion has been going on concurrently in the pages of The Garden. I have been acquainted with this disease for soms yeara, which at first I thought was some kind of ruet-fangus, bat which I now know is caused by a very amall insect or mite, an amall as it be invisible to the naked eye. It runs very quickly, and therefore often soon leaves a leaf or shoot if dieturbed. This no doubt accounts for the failure of experts to fiad the insect when apecimens of the disease have been tubmitted to them.
By lightly fumigating once a week with tobacco the plants sabject to the attacks of this pest, we have now no diffisulty in keeping our Begonias clean; indoed, I may say that tobaceo famigation is a parfect preventive, and almost a certain cure, if the plants have not been hopelessly crippled before it is applied. This year a batch of Acanthaceous plants, auch as Justicias, Aphelandras, \&s., had been anfering from this particalar disease for nome weeks before it was noticed. The gardener in charge of the plants thought a fuagus was the cause of the carling and discoloration of the foliage. By frequently dipping the affected plants in a weak solution of tobacco, the plants were, in motc casen, alaved, and have aince quite recovered.

Every cultivator knowa how easily irregularity of temperature or atmospheric moitture will bring on an attack of red-apider or thripe among plante grown nnder glass, and thin mite, which is smaller than either of the two peats named, and at least as quickspreading and iojurious in its effect on the health of the plant, can get a atart from the eame carue, viz., bad ventilation or some other fault in the atmo. aphere in the houee containing the plante.
I am quite certain that the divense, as above
dencribed, and which attacks various tropical her. baceous planta, is the work of an insect or mite whieh may be kept under by the frequent un of tobacco, either in solation or as fumes.
If farther proof is wanted, the following thould saffice. A fow daya ago I aaked Mr. Mauee, the eminent fangologist, to examine some examplea of plant affscted with this disease, and which hal escaped notice till recently. He reported af follom: -"The disease is caused primarily by very mianat, white insects-Saprophytic fungi, anch as Botryti, Hoterosporium, \&c., soon follow. Keep down the insects and the direase will disappear."
Certain forme of black blotehing and lenf.culimg which often disfigure Mandevallias of the Chimms section and some others beside, are the work of an almont invisible insect, probably a relation of the miechievous little red-spider. It muat be pought for very carefally, and when discovered it requires nowe care and perneverance to get rid of it. Bat this, of course, is another story. W. W., Kow.

\section*{KEW NOTES.}

Musa Frir,-A plant bearing this name is now in flower in the Palm-hoase at Kew. There appeara to be some doubt as to the true characters of M. Fehi, bat whether the plant under notice be that specigs or not, it is cartainly new to caltivation, and is atrikingly handsome. It has atems 10 fets high and 6 inchea in diameter at the base ; the learen are 6 feet long and 18 inchen wide, with a ejlino drical petiole 18 inches long, clothed with a white mealy down. The inflorencence is horizontal, the atalk 1 foot long below the firat whorl of flowen; the bracte are ovate, concave, the largent 8 inche long by 5 inchea in width, and coloured crimonclaret, the colour being very rich when the brach firat unfold. They are mach more persittent than in M. eapientum. There are from seven to nine flowers in each row, at the bass of the bracta, and the fruits are angular. M. Fehi is a native of Tahiti and Now Caledonia, and bears edible fraita which sometimes ripen their needs, and sometimes an seedleas. The plant at Kew was obtained from the Jardin den Plantes, Paris, three jears ago, and it is now fowering for the first time. A draming of it has bsen made for the Botanical Magazine.

\section*{Agave atrovibens.}

One of the largeat Agavee ever grown at Kevin now pushing up a flower-spike in the Pulm-houre, whither it has recently been tranaferred from tho Sacculent-house, where it was a conspicuous objet daring several yeara. It has fifty leaven, the averse size of which is \(4 \frac{1}{3}\) feet, and width 14 inches, tho margins are clothed with stout hooked teeth, and the apex with a stont straight apine 3 inches long. The spike when fally developed is about 30 feet high, the flowers, which are tabalar, yellow, and 4 inches long, being crowded on a thyrsoid panicle 8 feet long. The leaves on wild plants are said to be 12 feet long. A plant of this apecies flowered at Kew in 1888. It it one of the commonent of the Agaves grown in the gardens on the Riviera, miere it generally goes under the name of A. Salmings The big Agaves at Kow have been reduced in number by the flowering of a considerable number within the late thres years. This is the third giant that has flowered within twelve month. Of courte, they perish with flowering.

\section*{Wallichia caryotoidss.}

This is the handsoment of the three known apecies of Wallichia, which are all represented in the Palmhouse at Kow, where two of them, viz, W. deesil flora and W. caryotoides flower now and then; whilet the third, W. diaticha, is alwaya attractive in the arrangement of its leaven, which is as distichous as in the Traveller's tree, Ravenala. The habit of W. caryotoiden is soboliferous (tufted), the jearea forming a crowded cluster 4 feet through at the base, with a apread of about 12 feet ; each leaf is 10 fees long, the leaflete are 2 feet long, cuneate at the buse wider and jagged at the apex, dark green on the apper surfacie, sitvery below. The male inforecterect
is developed about a foot above the ground, and has a stout carved atalk clothed with large, boat-ahaped, overlapping, parplish•bruwn bracta, below which is a dense clater of drooping anbranched tails, about a foot long, clothed with pale pink flowern. This is
\& Co., of Colchester, at the meeting of the R.H.S. on Tuesday, October 29. Lycoris is allied to Amaryllif, but is distinguished from that genus by the small number of ovules in each cell of the ovary. The length of the segments in \(L\). aurea is 3 inches, and

\section*{Plant. Notes.}

Primula Cashmeriana (Capitata).
Tars North-weatern Indian Primrose is one of the most charming alpinet for fowering at this

the firat male infloreacence the plant has borne, the previous ones hitherto being female, lens crowded, with branched tails and inconspicuous bracta. W. W., Kew.

\section*{LYCORIS AUREA.}

Sevrrac plants of thin excellent antumn-flowering apecien (6g. 94) were hown by Meanr. Wallace
the colour a rich orange; the anther are yellow. coloured. The flowers appear unually in Auguit and September, and before the leaves; the plant is amenable to greenhoume culture. The bulb is anbglobose, 2 inches in diameter. It is figured in the Botanioal Magazine, to 409, as Amaryllis aarein, and it was introduced from China in 1777 by Dr, Fothergill.
secson, decorating the otherwise bare rockery. It seanon, decorating the otherwise bare rockery. rosette. The flowerl are of a violet colour, and well elovated on a stout atalk, which is covered with a menliness even to the calycer, remembling P. farinona in this reapect, as in otheri. I saw a bed of it the other day, and every plant was in bloom. The nituation, sheltered by a high bank, and ahaded by a
tree, seemed to exactly suit it. The heads were full of flower, and the bed made a fine show. A. \(H\).

Petrea volubllis alba,
This is a lovely thing when in flower. A small plant at the Botanic Garden, Grenada, is occationally laden with pendulous tail-like racemes of white flowers. A pretty contrat it is, therefore, to the parple-flowered Petrez; and when both flower together on a slope or on level ground, they form a conspicaon and pleasing picture, scarcely to be passed by unnoticed.

\section*{Villamilla octandea.}

This is a plant commonly to be seen and passed by in a walk abont the coantry. It is a pendalous scandent, Vine-like shrub, which, at the time of flowering, is oftentimes destitate of foliage, whilst at other times the foliage and flowera come together. The flowers are borne along the brancher, and when no leaver are present, the shrub looke like a maus of bare twigs covered with a costing of now. The flowers are white, with a faint green tinge. The plant might be worth caltivation in Earope, if it has not already been grown there. At its fruiting stage, the plant is even more conspicuous than when in flower; it then bears a great number of parplecoloured fraits. Biakets of different sizes are made from the large stems by an old Frenchman named Sprartz, an inmate of our poor-honse. These be sells at 2d. and upwards. W. E. Broadway, \(B\) otanic Garden, Grenada, British West Indies.

\section*{ABOUT CHRYSANTHEMUMS. \\ (The notes below were written before the first of the exhibitions was held.-ED.) Thert Park, Barnet.}

Thover so young a man, Mr. W. H. Leea, gardener to F. A. Bevan, Esq., has taken so high a ponition as a grower and an exhibitor, that the condition of his flowers naturally excites amongot growers the liveliest interest. I anw bis plants on the 265h, and so far as the Cryatal Palace show and the National are concerned, Mr. Lses should be in splendid form. If he has any weaknens at all, I should look for it in the direction of undue precocity; just as his formidable competitor at Latherhead seemed a little late. However, time will show. There are some 600 plants growing at Trent Park in numerous hoasel, and no effective concentration is made; but that may be no harm to the grower. Japanese are, of course, the prominent section, and many of these are indeed suparb. Iacarvede also are very fine; indeed, Mr. Leev' own eatimste-sud he is a capable if a partial judge-is that he has never been atronger than this season. Of Japanese, that truly beantiful white Souvenir dune patite amie is aplendid. So, too, in a newer one-Mutaal Friend, that neems like one come to atay; the petals are broad, and the flowere are masive, and of the purest white. What a grand flower is Thor. Wilkin! colour cromeyellow, the petalls long and drooping; and yet another anperb yellow is Pallanza, after Sanflower, bat rather richer, and having broader petals. The richcoloured Mr. Soward is very fine. A striking flower is Robert Ballantine, large and dirtinctive, colonr rovr-magents. Madame Ad. Moulin is yet another fine new white; and George Biron, a rich reddibh chestnut, is a striking flower. In spite of its carions name-Davil de Jales Ferry-violet-amaraath, with pale reverse, is a telling flower; while atill another white is found in Mdlle. M. A. Calvert, which bat a long ribbon-like petal, and is dittinctive. Then in Amiral Avellan we have another yellow of a rich orange hue; Madame Champon is a refined Etoile de Lyon, and may, if found generally astisfactory, yoplace the older variety; Mephisto has the colour of the old La Japonsise, and the atyle of Comte de Gorminy, and is full of promise. A very protity and true Japanese is Cryotal Belle, having the form of the old Golden Dragon, and of a delicate woft pink hae. That fine older yellow, cately tinted and fine in form is pood; very deli-
popalar ; and another white, Gairlande, is both solid and pleasing. Colonel Chase, though not large, is very beautifal, having a golden centre with outer petale of a soft flesh hue. Older varieties like E . Molyneux and J. Shrimpton are first rate. Madame Carnot, another white, bids fair to atand in the front rank of that aection. A good browny chestnat flower is Madame A. D. Gurond; H. Jacetot file, Mons. Panckoucke, and Abbey Maidenhall, are excellent also. These are, however, but a few of the many fine varieties at Trent Park, Ot incurved, there seem to be, if fower novelties, at least all the very beat of the old ones, and all in very fine form. Qaeens, Princesses, Teckes, \&ce, are all excellent, and promise capital blooms. Oi later novelties, J. Agate, white ; Globs d'o ; buff yellow; Lucy Kendall, W. Taunington, and Robert Petfield are the most noticeable. In a cool hhed, where wonderfal early bloome are being retarded, Mrs. W. H. Lses, a new Japanese, was grand indeed; so also were Eva Knowles, Colonel Smith, and other older ones. Throughoat the whole collection, there are ample evidences of the highest calture; wood is atrong, leafage fine, and fally retained, and flowers of the largest. It will be no matter for aurprise if in some notable competition they should be found hard to beat. \(D\).

\section*{Downside, Leatherhead.}

The very high repatation which Mr. W. Meare, Mr. Tate's able gardener, has obtained al a Chryaanthemam grower and exhibitor, naturally attracts special attention to his plants every year, and this neason as strongly as ever. He is at present one of the champions of the autumn queen, and usually takes a very high place in the competitions. His plants jast now are full of promise, and he has a very fine and varied collection of Japanese, incurved and reflexed, though atrongeat in the two former sections. With characteristic courage, Mr. Mease adds numeroar novelties to his collection, picking, so far as possible, the best. Of older ones, he has plenty in the finest condition, and such well-known varietie as E. Molyneux, juat now aplendid, literally for its colours anbeaten by any of the new ones; Souvenir dune petite amie, beatiful white; Eda Prase, Mdlle. Thé è ie Ryy, R. O nen, International, Sandower, Piéet Ribarts, Commander Blassett, Hairy Wonder, and many othere fairly well kjown. Then of new Japanese, A. H. Fewkes, nomething of maller style, bat of a deeper yellow, and broader petal, very fine; W. G. Nswett, a superb white ; Mra. C. E. Shea, creamy-white, fine bloome, and a stardy grower. Thi variety enjoys the reputation of being the dearest yet pat into commerce, as plants cost one gainea eacb. It ought indeed to be good for that sum. Golden Wedding, though represented by one plant only, is here very robaut and healthy, promising glorious golden flowers. Dachess of York, oft light yellow, is very full of promise. Another beautiful rich yellow is Sir E. T. Snith, that will probably be peen prominently later. Golden Gate, bronzy-yellow, promises very fine blooms. A grand new white is Mdlle. M. A. de Calvat, petals drooping, the blooms dense. An attractive incurved form is Globe d'Or, showing both clear yellow and reddioh brown bloome; this bids fair to make a fine addition to the nolid Japanese-or in it a real incurved? D. B. Crane is apparently an incurved Japanese, though termed of the ordinary incurved section; coloar golden-bronze. Another fine yellow is Pbobus, something of the form of Harman Payne, but more refined petal. Yet another Jellow, M. Charlen Molin, tinted with bronzs; a rich flower. Very diverne is Denil de Jales Ferry, large apreading blooms, dark violet-rone face, with silvery reverae. Another massive incarved bloom in Major Bonnafond, a masive, pale jellow. Good Gracioun grows very tall, but it givea some charming toft pink flowers of great beanty. The much-talked-of Pbiladelphia in here too, bat far from being incurved; it is promising to nstume a drooping character. A massive pare white is Madame Carnot. Mrs, W. H. Lees has flowers both white and much tinged with pink, but very fiae. Dalike of York is another flower of the Harman Payne type,
but deeper coloured, and batter. M. Grayer hat large blooms and broad petals, colour pale rom, white reverse. Mr. Joanny Moten it a atriking flower, colour of Callingfordi, very taking and effec. tive. James Myers, somewhat after Viriand Morll
in form, colour soft rosy-cerise, is very pleaing. Ot newar incurved forms, and these relatively are for, Mru. Archie Kingdon, white, flubhed piak, of Princess type, very solid. Globe d'Or, alredry noticed, is amongat the incarveds, in deeper han than previously aeen. Ribert Petfield in rery fin Jumes Agate seams here as much Japanore u in carved; Lord Rosebery promises very fine foma; so, too, do all the Teck typer ; indeed, they arm good. A. D.

At Lilford Road Nobabries, Cairbamel,
Mr. Norman Davis showed as aboat a fortaint ago, a batch of plants in flower of his nee whion Japanese variety Pallanza. We had meen tho mivies eleewhere, but its most valuable characteritiec conld not be detected so clearly as Mr. Davis' groap dinplayed them. The plants generally vera dranf very weak, and had been grown from eatting struck in May, and some in Jane. Yet each plant bad six or eight good blown upon it. The colour is rich, the petale mooth, and the bloom capital for decorative pappous As there will assuredly be considerable dicuim regarding the value of this variety for extibition purposes, and its nimilarity to the very protes het frequently anastisfactory Sunflower, it should bo remembered that Pallanza's greatest value will ho found to be ite usefulnen for market work, end for the general grower. It will farniuh abandaneo of flowers very similar-yet quite dissimilar-so Sm. flower, without any apecial culture whaterer, on the other hand, most growers have trouble mith Sautower, and some have actually discarded it, yit Davis admits that it may not be practicable of exhibit the two varieties on one stand or in the amme collection. Oa the crown bud, the fome bears atriking resemblance to Sanflower, but in the terminal the likeness in much diminiched. Whilot is claimed that as an exhibition flower Pallazas rill onat Sandower, there can be no donbt whaterer that in every other respect it is saperior to that raiiefl. It has already found anusual favour with matk growers, and blooms of it this time next neason a hond be as plentifal as Blackberries. We may add, the the variety was raised by Mr. Briscoe Ironside, wilio reniding in Italy. Mr. Davis regards os aedilige which showe a tendency to become a good matral and a generally useful kind with as much faroris 4 one likely to give fine exhibition blooms. A nividy with the remarkable name of Son Altesse Sida Tiud \(B=y\), and hailing from Dslanx, the French raiver, if expected to become a aseful kind. The downaty very distinct and pretty, rosy-pink, almost the amis coloar seen in the old variety Roseas apaerb, but in this case mach lighter. A good wiem of plants of Madame Carnot was oberem and a vimilar one of Mdille. Théere Rel. Mr. Davis is inclined to consider the lat-named best white Chrysanthemum atill, but Madame Cand promises well, although when this notice was what it was too early to determine its exact wim Lady Biron if a capital white Japanese bloowe wid incurved petalu, large, and not tightly cappedu will no doabt prove to be a good thing. Allection named seedling white Japanese in this cole Mel seems to possens great ponsibilities. Pride of mider ford, for which Messre. H. Cannell \& Sons obsaide an award of merit recently, had six good badien wer plant, and promised well. Many other raritier mily blooming or about to bloom, inclading Philadep and other new ones. Comte F. Lonrane has nemith dropped out of collections, but it is a verf mity flower, with a white ground, and nearly coverd atripes of rose.

At the Royal Exotic Nurserile, Chiluthe
Mesart. Jas. Vaitch \& Sona, ataged agood giv of plants at the October show at the Royal Aq but the general collection was not by and
a week or so since in an excellent manner. International appears to be coming very pale yellow or nearly white, and the slight rowe seen in the flower latseasen is wanting. Miss Louise D. Black, an American novelty, from Hill \& Co., ie not at present a deep flower, but the incurved floretw are of reddichorange colour, and very good. Warrior is a Japanese incurved, the flower large and globular, rather closely capped, bat the colour pale drab, detracts from its value. Graphic (Owen), a Jupanee, is now-white. with irregular patale, and promisen to be very attractive. Pallanza was very deep in colour in thie collection, and will rival Sunflower. The well-known variety G. C. Schwabe generally does very well at Chelsea, and this seavon offers no exception; Whilat the ame remark may be applied to Eda Prasi, which in generally good this year. Lonise has been capital, and Mra. F. Jameson is very good. The new William Bolia, roy parple-coloured, with nilver reverne, will make large blooms; and Mons. Panckoucke promises well. Mons. Chas. Molin (Calvat) will prove to be a very good yellow; and Charles H. Cartis (Jones) will no doubt make a good addition to the incurved section-the flowers are a good yellow colour, and when finished the blooms will be of large size. Madame Carnot is expected to become a very good white Japanese flower, and the bad an opening would quite anpport this view. A variety in the way of E. Molyneux it M. Geo. Biron; it has the advantage of being a good doer, but as regarde attractivenem, we atill prefer the older variety. A very spreading yellow Japanese flower is Dachess of Wellington (H. J. Jones). The colour in good, and the petals, though narrow, are very long, but the bloom should be deeper. Mrs. W. Dreer has a flower in the way of Mre. F. Jameson. Bads of Mrs. C. E. Shea were rather late, and had not yet opened; but there were good flowerm of Colonel Bourne ( O wen), a nice short grower, bearing flowern of a capital crimson, not anlike James Lynch. Nyanza, from Hill, America, is also a capital colour, but apparently the petal by recurving greatly will not show the colour much. Many of the older kinds are grown well at Chelsea, and at the same time the collection is full of novelties. \(\boldsymbol{P}\).

\section*{Woodhatch, Reigate.}

When Mr. T. B. Haywood received the customary large party of friend who annually visit his delightful residence and gardens, at wat the cate on the 30 th ult., he had to ahow them one of the moat varied and attractive of private collections to be fonad, perhapy, in the kingdom. His gardener, Mr. Salter, does not confine his favours as a firstclass cultivator to one aection only, for he presents Japanese, incurved, Auemone, reflexed, and Pompons in rich profunion, and in the mote varied forms. It is difficalt, indeed, to say which exbibits the highest culture, for if the great Japanese seem mot attractive, the other sections are of the highest relative excellence, and are of their kinds exceedingly beatiful. The bulk of the ome 800 plant grown are ranged on sloping banks in two long lean-to housen, where they make a aingularly attractive ahow. Of newer Japanese, the dominant section now, special interest attaches to an exceedingly fine white from Australia, named T. B. Haywood, that should make a good reputation. International is here very fine, yet not coaras ; and Jas. Myers is excellent. Violetta is early, colour white, flushed pink; and Wilfrid Marshall is a fine yellow. Another fine Australian white is Mre. H. B. Higginu. Sach well-known forms an Mrs, E. G. Hill, W. Seward, Eda Prant, Viviand Morel, and Mona. Panckoucke are first-rate. A very beautiful variety, also white, is Florence Emma; a very atriking flower in Madame Maarice Ricaud, colour rosy-red. Good, too, is the highcoloured Commandant Blussett; and Colonel C. B. Smith seem: to ba here, a: everywhere, very fine indeed this reason. Mr. C. Shrimpton, too, is in grand form and colour; a rich clear yellow in Thon. Wilkins. Prenident Calvat, of chestnut colour, is large, but rather rough; Lady E. Saunders in of a lovely atraw-primrone hue; Chas. Davia is very fine; and a very pleaning flower in Mr. R. Dean ; one
of the mont pleasing woft whiten is Rove Wynne. Deuil do Jalen Ferry, rich amaranth, is very fine; 0, too, is M. Grayer, large, and of a plessing pink hue. A superb white here, as elsewhere, is Souvenir d'une petite amie. A truly grand flower, of delicate straw-yellow colour, is Madame H. Damolif, the petale very broad and mansive. The white Banuty of Exmouth is fine; and J. Agate here is a Japanese incurved, though in other direction a true incarved. Of this latter section, Madame Darrier, M. A. Bahuant, Baron Hirsch, R. Petfeld, the Qaeen family-indeed, all the beat-are well represented, and in capital form. Amongat the Anemone section, very fine are Dalaware, Mru. Jadge Benedict, W. W. Ator, Minnie Cbate, Thorpe Junior (rich yellow), Sir W. Raleigh (mave), Owen' Perfection, Nouvelle Alveole, and Mons. C. Leboucqz. Of new rellexed, a very beautiful flower is Clara Jeal, ivory-white, with gold centre. Amongat Pompons, Elaie Walker, goldenbuff; Prince of Orange, reddish-gold; Pygmalion, reddinh-cheatnut; Maid of Kent, Tousenint Marisot, Black Douglas, Golden Malle. Marthe, St. Michael, and Eyneford Gem, are nome of the besto It is ponible, however, to refer to only a fow out of the great collection. A very beantiful ahow may be seen in one of the Orchid-houses of eleven pans of the charming Pleione lagenaria, each about 13 inchen acrow, forming dense mases of flowern. Also in another house a grand mask of varied colourt, obtained from apperbly-grown and bloomed zonal Pelargoniums, auch as could not anywhere for quality be excelled. A look into the fine and airy fruit-room is also an interesting featare, for Apples and Peare are not only plentifal, but include noble amples. \(A, D\).

\section*{Mr, W. Wrlls, Earlswood.}

On of glorious a day as was the 28 h , it was a delightiul walk from Woodhatch, acrons the common which intervenes to Mr . Welle' nurtery at Earlswood. Here the plants may be counted by thousands, and it is to the grower's credit that every one is good, and the diepley a first-rate one. Special interest naturally attaches to the huge trade collections, because novelties are looked for, and we are not disappointed. The bulk of the plants are arranged in a double-sided centre bed in a very large long apan-house, and the aides and end. are also fully furnished. Varisties, too, are largaly placed in blocke, ot that it is more easy to ascertain the average character of any. Japanese, of course, claim first attention, and foremost amongst these is the new M. Chenon de Leche, broad even reflexed form, outer petals rosy-lilac, centre goldenbronz9; this is a gem. Of hairy sorts White Plume, Hairy Wonder, and Luais Boehmer are very good. A good variety is M. Ad. Girand, atyle of Gloire do Boesker, bat finer, richer colour, and dwarfer. J. Shrimpton is in mperb colour, really yet of ite line unexcelled. A grand white again here is Madame Carnot; and Colonel Chase, though not large, is lovely. Mons. Cb. Molia is of a rich rosy-bronze. Rose Wynne, one of the finest whites; though Souvenir d'ane petite amie is one of the very best now. Mrs. Airdrie, incurved form, white, striped rose, is good; and apecially fine in Mons. George Biron, reddish terra-cotta, with pale gold reverse. A fing variety is M, H. J. Jones, colour rosy-amaranth, with silvery reverse ; and Madame Mauriel Ricord is here, great beanty, style of Excelsior, but richer coloured. Deuil de Jules Ferry is superb; this is a conetant variety evidently, as it is so good overywhere. Mdlle. M. A. Calvat is one of the fineat white without doubt. Louise, now getting well known, is a mastive flower of delicate hue. A new and fine jellow is Thow. Wilkins; Mand Pearton, coloarnotunlike that of Belle Panle, but with larger flowers, is very pleasing. A promising flower of rich golden bronse hue is Moucherette, that bide fair to dimplace Colonel C. B. Smith, it is of fine and masaive. Bearty of Teignmoath, crimon-maroon, shaded violet, and vilvery-pink revere, is a beautiful flower to be borne in miad. Of incurved varieties, J. Agate is here true, and of
fae form ; a great beanty in this section also is Mre R. C. Kingaton, woft lilac on white ground, fine form and deep. There are handred of other well knowe: varieties, also of Anemones, reflexed, Pumpons, \&c. Single varieties are very charming, and Mr. Wells grows and raise largely; a good half-doren of these so delightfal for cutting purpoee are Vargin Qaeen, large pure white, rose-pink; Mary Auderson, fleeh, charming yellow; Bertha, piak-magenta; and Lizelo Mainwaring, bluth white, A lerge number of plante of Souvenir d'ane patite amie from March-atruck cuttings, and carrying fine bloom at from 15 to 20 inches in height, show what a fine variety it in for grouping. The new Japsnese incurved Globe d'Op is very fine, and maken it a capital addition to that aection, if it may be mo termed. \(A, D\).

Mr. W. J. Godpray's, Exmouth.
large apan-roofed house, 156 feet long, and 27 feet wide, full of exbibition bloom of all the newest and beat varieties of Chryanthemums, wa the grand aight presented to my view on October 24, when risiting this popular and increasing sea-aide town. The entire collection showed signs of aperior akill in cultivation, and could not have been more healthy, stardy, and clean; the house in which they were ataged was erected pecially for this objoct, baving an arrangement of thin tiffang for shading in case of bright aunshine, but which could eatily be removed when not required. I was also fortanate in being conducted by Mr. Godfrey himeelf, who is now regarded as une of our mont experienced apecialiats in Chrysanthemume. The admired and greatly-diccasaed Beauty of Exmouth, with which Mr. Godfrey made hia debut, originated an enthasiasm for Chryanthemam cultore, which bas resulted in the superb display mentioned in the first few lines of this article. The collection referred to includes all varietien worth growing, varietie of home and Continental raising. Among these, I misy mention a few which, perhaps, have already been noticed, but are here presented as grand and reliable varietien. White Madame Carnot, an immone bloom, very deep. a grand flower. Mdlle. de Is Galbert, a lovely white, beantifal form, likely to become a very popalar variety. Matual Friend, also a largo white, outer petalis very elightly shaded with mauve; Mrs. W. I. Godirey, a large batch of thit variety of turdy growth, many plante carrying five bloom each of the 'most benutiful white in existence, the petala alightly hirsated, and broad petals, maseive, boing a greatly improved A. Hardy. Dachess of York wat giving aome very promising bloome. Mise Rita Schroeter, a monster bloom, creamy-white, each floret shaded and edged with lilac-rose; Mru. G. Weat, of American origin, alon an immense bloom, after the atyle of Mre. E. W. Clarke, bat aitogether superior in eizo, form, and colour, the richeat yellow in the houve; Mise Louive D. Biack, in form aimilar to Lincola, bat larger florete, and much richer coloar; Miss Elnie Telchmann, milkwhite, one of Mr. Shea's seedlings, capital form and mubstanc \({ }^{\text {; }}\) A. H. Fewken is of a capital dwarf, aturdy habit, a rich globalar bloom, and of good sizs; Beauty of Teignmouth was represented by bloom mach auperior to Dake of York, having a better habit, much richer in colour, and very distinct in foliage; Gold Dast, whose petals are of a most beautiful plume shape, is an extremely atriking flower of a clear canary-yellow; Nyanza seeme to be an improved Beanty of Castlowood, of a brighter coloar, equal in sixe, bat a mach better grower: Phoebus, a splendid yellow, will be mach ought after, and is here represented by some very handsome blooms; Philadelphia, largo batch in growing, colour a pale yellow, changing to white.
About 400 eedlinge are being cultivated on trial this season, many of them heve developed blooms of exceptional merit, while a great many were yet to develop, bat looked very promiving. The eelected varietie are named, and will be sent out next pring. those that are already considered acquisitions, include Pride of Davon, which boast of being the largeat bloom in the house, white, alightly thaded
pink, long drooping outer petale, forming a very deep flower. Wilfrid H. Godfrey, a very diatinct variety, canary-jellow, reverne atraw colour, the florets curling at the tipa, which lenda a charming effect. Mr. J. P. Beyce, a very handsome variety, noft rosepink, broad florets, bloom of good aubatance and form.
A large variets is grown for decoration in other hoasen, besides seedlings in various stages, both of his own and other noted raisern. Mr. Godfrey has apecial arrangements in his houses made for the perfecting and mataring the seed of the flowers selected for this parpose, his experiments having been attended with a fair amount of access. Several houses were fall of Carnations of his famed varieties, showing immense quantities of flower-buds. D. C. Powell.

\section*{At the Ryecroft Nubsgey,}

At this narsery, in Hither Green, just ontaide Lawisham, the collection of Chryanthemams is as intereating an ever; indeed, Mr. H. J. Jones hat pursued the cultivation and raising of Chrymanthemums with auch thorougbness since he commenced a few yeare ago, that his collection may be expected to become increabingly important year by year. N © vertheless, the visitor who goen to admire a pictorial diaplay rather than to examine the characteristics of the blooms of the newer varieties, may be leas startled with the effect produced than last year. This will be due to a different arrangement which has been adopted. Then, evergthing was done to create effect, but this year the arrangement enable the visitor to come near to any bloom he may wish to examine, and the tendency is not to increase the effect. Fewer older varieties are cultivated in special manner than formerly, in order to give more attention to noveltiez, and particularly to the increasing number of Mr. Jones' own needlings. Most, but not all, of those we can now notice belong to the last-named clane.

Additions to the incurved nection are alwaya more important, because rarer, than those of the other classey, and a good number of plants of the two varieties that are most intereating at the present time seemed to afford a good opportanity to entimate their worth. Taking Cbas. H. Curtis firat, we have a very large bloom with plenty of florets, and excellent in coloar, being bright golden-yellow; bat from present indications, the flowern will require coniderable dressing before they cre staged as exhibition blooms. D. B. Crane is a smaller bat deeper bloom, nearly old gold in colour, and is one that will require very little drensing at all. When ataged, however, the blooms of Chas. H. Cartia are mach more effective than the other, for they make as pretty blooms as any incurved fower at all.
Tarning to the Japaness varieties, there are Mr. P. Parnell and G. H. Hollingworth, both seedling., the former a large bloom of good colour (crimson), with loone florets ; and the latter a light yellow bloom with very wide florets, apparently to be very large, but bloom not jet developed. Mra, Go H. Smart is a vellow and bronzy-coloured flower, an incurved Japanese, poasibly distinct, bat not quite to our mind. A bold incuived Japanese seedling hav been named Mrs. C. J. Milla; when first opening, alightly bluah, but afterwarde coming pure whitelikely to be a good one. Mins Clara Walker is another good white one, nimilar in build to the Meg Merrilie» type. Dachens of Fife is another white incurved Japanese, similar in some respecta to R. Owen, and very bold and deep. J. H. Richardzon has extra broad florets, white, atriped with rone ; and Lady Randolph is a rosy-parple flower, with ailver reverne-a very pretty contrast. Mias Ethel Addibeen certificated, and hase popalar ; it has already been certificated, and has large flowerr, broad florets, coloured rove, with wilver reverse. Miss Elsio Toichmann is an incurved Japanese, has wide florets, and lot of "apparentily make a large flower, there being with a straw-coloured centre ; the flower is whiter It one of the firnt varieties. Mins Alice M: Love it one of the îrut varieties certificated this neason;

When apesking of incurved varieties, we should have mentioned Mr. Jas. Murray, which will, no doubt, make a denirable pink bloom; the flowers had not "bailt" when these notes were taken. Mrr. G. Gover is one of the fantastical varieties, has very irregalar floret, red with buff reverne, and will make a large flower. T. H. Wooderaon in size reminde one of Etoile de Lyon, but, we think, lacks refinement. A capital variety, we believe, Mrs. Richard Jones will be : the flowers are white, large, florets rather narrow, bat long, and recurving slightly at the tips ; it in graceful, and from the large number of plants in bloom it is a very eary "doer." Mention may be made of Mr. P. Mariton, a hairy French variety: colour, chestnat; likely to be a good thing. There are so many new and interenting plants in thi collection, that we are able to notice but a portion, nor can remark apon many of last year's noveltien, and new ones from other raieern. Firstrate blooms of such sterling varieties as Amiral Avellan (Calvat), Jno. Machar (Cannell), A. H. Fewken (American), Mrs. E. S. Hills, Mataal Friend (a capital white one), Mdlle. Paul de Croy, and International, were, however, to be eeen; and some of the finett flowers of that excellent Anemoneflowered variety, Daccarten, we have yet meen. We must conclude, however, after mentioning an incarved Japanene named Lady Playfair, from the ame American raiser as A. H. Fewkes; the bloom is pecaliarly pretty from its delicate tint. \(P\).
Nurgery Noteg.

THE ALLINGTON NURSERIES, MAIDSTONE.
If clean land, thoroughly-well tilled, with half-afoot of absolately loone soil on the anrface throagh constant working, and atocked from centre to circumference with healthy young trees, are indications of akilfal management, then Mearra. Geo. Banyard \& Co. are entitled to congratulation. The fight of trees versus weeds, has not been left without the evident interference of the caltivator in favour of the crop that will pay him, or which at any rate, is more likely than the other to do so. It is undoubtedly disappointing, that notwithetanding all that has been asid and written anent frait calture for profit, and for home consamption, there atill exist hundreds of acres of good land, on which the old fruit trees of a generation ago atill atand, trees that would be unremunerative if only on account of their great age, though in many cases they are doably worthlens, because the varietien they represent have been nuperaeded by better and more ueefal morts. On the other band, there are thousande and thouncnds of young trees of the bent varieties in the nurseries, which would yield a profit to the cultivator if they were planted in the place of thene monsgrown antiquities, that furnish arguments of a kind every year to persona seeking to throw cold water on the fruit-growing movement. Fortunately, this is not the case in regard to gardens. Gardeners have learned the lenson well, that good crops of fruit of first-clans quality may be looked for only on trees of moderate age, and that if these fraita are to be worth anything, the best varieties posible mast be planted; hence there has arisen from gardeners a atisfactory demand for thene.
Such remarks as the above are quite àpropos of our visit to Maidstone in early October, inasmach as the large quantity of frait trees there forcibly reminded us of anch orchards as we have jast described. How astiafactory it would be to the owners of rach frait groands and to all concerned, if they could be convinced of their opportanitien!
Perhaps few localities have had a leas quantity of rain during the eeason now rapidly closing than the Maidatone district, for Mr. Buayard informed us, that even when the long-endured drought came to an end, the rainfall there was particularly lighto "Have you done any watering?" we ventured to ask. "No," was the reply, "not any, it would be impracticable on a large soale, and I think the ajatem
results in more harm than good," How to exphin the healthfulness and vigoar of the whole of the trees after auch a statement, woald be a pozzle to atrangers, but one having a knowledge of the yudem of caltare here, would anhesitatingly conclade the
the sarface tilling, the constant hoeing of the nurimy soil, are the chief causes of the abundant succere Th soil mast neverthelens be very exceptional, becum while it is comparatively light and conducive to now formation, it was of anficient depth and reteotionnens to pais throngh a searon like that of 1895 minh
but few ill- effecta. We first went among rome min but few ill-effects. We first went among rometran of the well-known Apple Bramleg's Seedling, "jow
to see the crops of fruit they are carrying." ? here were froits of surprising quality and qual tityo Nor did Lane's Prince Albert, nlid was fruiting in the same apot, make a leun mo thy uhow, but, of course, neither sorta had nech an effect as the fruits of Gascoigne's Scarlet Sudliyg always a well-coloured Apple, but in the Noider district enpecially \(n 0\), where indeed it is in m Some fine trees were clone to these beariag apical fruits of Baumann's Winter Reinette, a pariefy ol which many growers we have met have a reg high opinion. Bismarcis, too-a grand applo -was bearing heavily, bat it is meldom it dom not, and we have an idea that planters are not uning this variety 10 freely as they might with advantage. One of ite most pronounced qualitiet is this predirposition to heavy cropping, which we hare noticed again and again, then the frait is of good aize, and according to information we have had from some who have tasted the fruit when cooked, it is also of first-rate quality. In appearance the Apph is certainly good, and in addition to other adranatay it posseaser, the frait hangs well upon the treen, wil may be harvented later than many varietien. Wo next pase a grand lot of atandard Cherry-trees, proty apecimens, and in robast health, capital trees for tho Kentisb, or, indeed, any other Cherry orcharinh Bat neur by is a very large batch of standard Aplea and Peara, aleo for orchard culture. What excellent trees they are! Sjems so mooth and straight, uif moulded, and thick withal. These 60000 atanderd were only four yeara old, and the mejority d them have large heads that suggest rather half-a-dozen yeara. How the different varidin vary in their growth! Of course, all the trees are budded or grafted low down, and the the is formed by the ncion, not the atock, hence th difference in time required to get varieties up in conaiderable. In another part of the nariery \({ }^{1}\) further batch of standards is seen, and Mr. Buajuld estimates that in all he has about 120,000 such treas Now, the entire atock of frait-trees is decidedly fithe class, bat none in the collection are finer of that kind than these orchard etandards. At a mation of course, the varietien represented in then trean In those of sterling merit, and useful for martet, Wh noticed a few of them, namely, Ecklinville Seeding Golden Spire, Now Hawthoraden, the Queen, 0 aed of the beat flavoared of culinary varieties; Banty of Bath, Beauty of Kont, Peasgood's Nonsach, Colond Vaughan, a great favoarite in Kent; and last, but nof least in importance, Newton Wonder, a fritt-clall Apple, sent out by Mesars. Pearmon \& Sons, Chilm This Apple, wo believe, was the ramult of serve between Damolow's Seedling and Blenheim Orime and the young trees and fruits apon the name Maidatone, were sufficient evidence of its cropping qualitien, and of the excellent character of the fraile Pueving on to one of the alopes-which are commed in Mr. Banyard's ground-we were compolled th pause to inquire the name of the Apple manime such an effect in oas of the hollows. "Tast in Gisf coigne's Scarlet Soedling again," snid Mr. Buryul It was another batch of this excellent Apple, without doabt, it farnished the greatest piftorin effect to be seen in the nursery. Bat there is listio time to linger in auch a nursery, and we were nom remarking upon another excallent Apple nam Allen's Everlasting. It is asanlly good in tho the quality is aplendid, and it cropes very froely. fruit is only of mediam size, ruseety in apposiming with a fow red blotches. A remark is cortuily
deserved by a quantity of first-class two-year-old trees of Siirling Castle, an Apple that needs no praise now. Then there in Hollandbury, a good usefal Apple; and many othars, which we mutt perforce pass over. In doing so, however, the health and kindly growth of the trees, whether on the free stock or the Paradise, is very apparent. Double grafted tree also are seen, varietie that are not satisfactory except treated so, and by auch means even B!enheim Orange Pippin will bear crops of fruit an pyramide at a ccmparatively early age. A conaiderable number of amateur standard were looking well. This form of training is atill very popular with amateurs, as the atem can be crepped its whole lengtb, uotil a good-nized head is made, When, if denired, the atem may be cleared clonely of all growth.
two reason. The first is, that the trees here which were grafted upon the Paradise many yeara ago, furnish \&ffectual proof that there was nothing in the objection that ased to be raised that trees so treated would be ahort-lived. The other reason for walking amonget them was the opportanity they afford of eeeing rare and interentiog varietien that are, to some extent, little known; and reference might be made to the Apple White Traneparent, an excellent early Apple, for which Mr. Banyard obtained an Award of Merit from the Royal Horticultural Society a short time agn. It is considered wuch better than Early Jalian, is a sure cropper and capital grower. Foster's Seedling, with flesh aimilar to Cellini Pippin, and fiavour like Blenheim Orange; and Mra. Barron, a good kitchen fruit. might both be better known. Mr. Bunyard think
crops of fruit from Apricot indoors. These mut be passed, however, with the remark, thas: of the former, gardenern would do well to plant lese epariagly: and in regard to the Apricots, the bordere duriog winter should be kept at dry as it is possible to get them. Strawberry-planta are grown in large quantities.
By no meane do Mosars. Banyard \& Ca.'s treasures consist exclusively of frait trees, though these are their specislty. Roves we saw in abandance, standard varietien especially. The choicer sorte of trees and thrubs of vivid-coloares folinge, or conspicaons flowers, and herbecsoat planty, lese common than mont of the apecies, are also to be seen at Allington; and bed we more time and pace at oar command intaresting notes concarniog such might be writton.

Fig 95. - hoolletia tiorina.

Large-ged trained trees of Apples and Peary, as gridiron, horizontal-trained, or fans, are kept for supply to purchasers who wish to cover walle or eapalier with trees that will frait at once.

Paning ame tree that had been transplanted, a discussion arose to whether fruit trees should be pruned when first planted. Mr. H. A. Pearson, in his lecture at the Palace recently, after fairly atating the grounde for pruning and for con-pruving the first aearon, concluded by recommending that the trees should be pruned. Mr. Banyard, with his large experience, is quite of an opposite opinion. Theoretically, the reasoning of either mehool is very plausible. Each agree that their efforts should be to induce mont root action; but to this end different and quite opposite means are adopted. It is a question that practical planters may soon, by experience, aettle for themelves.

The trial ground should not encape notice, for
that James Grieve will be better than Cox's Orange Pippin; and our attention was directed to the dark green caliaary Apple, Duke of York, from Tasmania, sa being an immense cropper.

Pears occupy an important position in this narmery. Large breadths were observed of bush, pyramidal, and trained trees; bat our time wae apent on this occation more particularly amongot the Apples, which this resson have carried so many more fruits than the Pear trees.

It may be interesting to stato that nithough a good number of orcbard-trees of Appies, Pears, and other fruits, are well grown at Maidatone, the best apecimen. Apples were to be found this seaton on the trees in the open nursery.
Many other iteme interest call for remark, nuch at the splendid and largestcck of Fig trees of the newer rarieties in pots, an well an others, and the auccesaful aethod by which Mr. Bunyard obtain good

\section*{houlletia tigrina.}

Os the occasion of the meeting of the Rural Horticaltural Society on Taesday, October 24, Sip Trevor Lawrence, Bart, exhibited an inflorenceace of this distinct and very pretty species. They havo free, spreading, sub-equal apals, and a narrow fleshy lip continuous with the column, the baen concave, and the lateral coming from behind the retrorely-carved born-like procensen; the middle lobe articulated and undivided, uanally truncate at the base. The pucudo-bulbe are one-leaved, and the flowerspike sises from their base. The peeudo bulb in thin opecies is 2 incher long, ovate, and the leaves plicate, and of a dark-green colour. The sepale are concave, of a pinkish-butf motlled with greeninhyellow; petals bright yellow, with mottling of crimson; lip pale yellow, at the tip white, with minute parplith-crimeon apot elwwhere.

Thin New Grenadan species (6g.95), like the othere, succeed in the intermediate-house, and daring it period of flowering it should be wapended, as the inflorencence arche: forward and droops over.

\section*{PREPARING LAND FOR, AND PLANTING, FRUIT TREES.}

I recoluect attending a Fruit Conference at Chiswick when Mr. Pearnon of Chilwell, in a lecture, laid stress upon the way nurserymen were sometimes accused of supplying unsatisfactory fruit trees, while the cause of failure rested with the planter. That non-anccess in fruit caltare may not unfrequently be rightly attributed to either bad planting or inadequate preparation for planting, I think few will deny; possibly mistakes are mont often made in not taking afficient paina with the preparation. In commencing hardy frait culture, it pays to do everything connected with it thoroughly well; and the most important point that must not be overlooked, are firatly, to select a auitable site, and properly prepare it ; secondly, to purchase good treen of the best varieties; and thirdly, to plant them well, and protect them.

In dwelling upon this important sabject, I cannot do better than deacribe the manner in which the frait-garden here was formed and planted, particularly as the tref and bushes are making very eatiofactory progress. The site selected was an old pasture situated above the fog-line, opon a rather sharp S.S. E. slope, well sheltered from the north and east by higher land and trees, and fairly so from other quarters by trees. The noil is a good loam, inclined to be heavy, resting in some places upon a tony ubsoil, and in others marl. The garden, which is oblong in ahape, was made and planted in 1893; the work commencing in April, by draining the land with 3 inch tile drains, placed 3 feet deep, and 15 feet apart. This is a necestary preparation that does not always receive the attention it deservea. An instance of this came under my notice some years ago, when I was asked advice abcut some young Apple trees which were what was termed "going back." After atcertaining the nature of the noil, the cause of the unhealthy condition of the trees was attributed to deficient drainage. "Ob! that cannot be, just look at the fall in the ground," was the reply. A descent in land that possessen a tenacious ab-soil will not, however, ensure good drainage. Once the draining was completed, the land was trenched to the depth of 2 feet 3 inches in the manner known as bastard trenching-the top apit being lept upon the eurface. This proved a hard undertaking, for, as will be remembered, the nummer of 1893 wes very dry, and consequently, the coil was unasually hard. This dry atate of the weather, however, had a beneficial influence apon the work, both by weetening the soil and killing herbage; at the asme time, it kept the newlycaltivated land in a dangerously aerrated atate for planting, and in order to connteract this evil, and also break the cloda, a Cambridge-roller drawn by three horse was neveral time run over it. This done, another digging, thir time one spit deep, was afforded, and at it proceeded, the turf was well broken, and mixed through the soil-thus a satisfactory site for planting fruit trees upon was prepared.

Intersecting grase walks, the priscipal ones being 10 feet wide, and the others 5 feet, divide the garden into nix divisions, the two larget occupying upward of half the garden, and placed on the highent ground, being devoted to Apples. The next two, which take up more than a fourth of the pace, are planted reapectively with Pearn and Cherries, and Plams and Cherries ; while the remaining two, which are nituated on the lowest ground, are occupied by Carrants, Gooseberries, and Raspberries. The Apple , Cherries, Pearn, and Plame which are pyramidal and bash in form, are planted in squares, and are 12 feet apart. The Carrante and Gooseberries are in rows 6 faet spart, and the Rasperries are also in rown 6 feet apart, the plant being 2 feet asunder in the rows. It has boen remarked that the rown of Raspberries are needlenily far apart, but this is not to, for it was found to-day by meanarement that many of the canes of R. Superlative are upwards of 9 feet in length; at the same time they are clothed with
robust foliage, and bright red-coloured rind from base to top (good indication of the probable production of abundance of fruit next year), which could acarcely be the case if the row were appreciably closer tngether.

Planting commenced with the bush fruits daring the lat week in October, and was completed with Apples the second week in November. The trees, when received after a journey of about 140 milen, were unpacked, had their root dipped in water, and carefully laid in damp soil. The weather being favourable, and the ground in excellent condition, however, no time was lost in at once planting them in their permanent quarters. In order to facilitate this, the position of the rown had been previouely marked out, with pegs at each end, and a line had also been prepared by being knotted to indicate accurately when atretched each tree's atation. In proceeding with the planting, the root of each tree were closely examined, when any broken or ir jured portion were removed by a clean cut made on the under aide. Pains were taken to spread the root. regularly, and keep them up near the aurface of the ail, which was pressed firmly about them. Any trees that required it were then staked, their bark being protected from injury from the ties by piece: of old indiarabber hone, and finally each tree wan accarately named, and mulched with farmyard manure. The only quarters that received manare, other than that employed an a mulching, were those occupied by Currants, Gooseberries, and Raspberries, and these had a dressing of decayed farmyard manure worked through the nurface noil. It may be mentioned that the only lossen that occurred in the plantation, which covers nearly three acres of land, were a fow Rasperry-canes. Thos. Coomber, The Hendre Gardens.

\section*{BOOK NOTICE.}

The Genus Mabdevallia. By the Marquese of Lothian and Mise F. H. Woolward. (Porter London.) Part VII. Price £I 10s.
The authors of this elegant monograph are getting near the end of their work. A notice to sabscribere inaued with the present part atates that the next number (Part VIII.) will, it is hoped, be the last. It will be well, therefore, to postpone any farther remarke antil the completion of the book, when we shall hope to review it as a whole. Suffice it to any that, with Part VII., the number of apecien and varieties depicted and deacribed is brought ap to eeventy, the recent decade comprising Masdevallia caloptera, M. gemmata, M. O'Brienians, M. pacbyura, M. porcelliceps, M. radiosa, M. triaristella, M. trinema, M. troglodyten, and M. velifera. With two exceptions, these are all species of the late Professor Reichenbach; and also, with two exceptiona, were first described in the pages of the Gardeners Chronicle. Several are very rare; and in at least three cases, Mins Woolward has been anable to obtain any record of the native habitat, which remains a trade secret-to the advantage of the importer, but seriously to the disadvantage of cience. A, B, R.

\section*{The Week's Work.}

\section*{THE KITCHEN GARDEN}

By Johm Lambert. Gardener, Powis Caske, Welehpool.
ABPARAQU8 BEDS.-Where Asparagu: is grown in beds, and the heads are preferred in a green natural state, the soil above the root will not be more than 3 inches in thickness. This may be forked over very lightly and carefully so that no roots are broken, to break up the hard aurface of the coil. The manure to be applied should vary according to the nature of the soil. If iuclined to be very retentive of water, use stable-dung and a mall quantity of light sandy soil mixed with it. This drensing may be made 2 inchen deep. If the aoil in already mufficiently light, afford the beds a good dremsing of cow-manare, which will enrich the mil, and also afford protection
to the roots from very severe front. Where a thick nurface of soil in kept above the roots for blanching purposen, some of thil may be removed by draning it with raken into the alleys, and the aurface brotem up lightly. Then apply a dreaning of manare, and leave the spare soil in the alleyn for an in the apring. If the beds are getting vir poor, some finely-crushed bones may be given at this season of the year, but artificial manama best applied to a crop when in active gromth. I Asparagas is grown on the single-row method the raiaed mound are apt to become bare tom autumn, owing to the heavy raint, and very leb forking will be required; the soil between then however, should be deeply broken ap, and ever tinh space between the row that is uned for a when cutting the produce. Drean the moundrim nice rich, frenh soil if they are too bare, and core them and the paces between with a good deming ol manare. No further attention need be give them till pring.

FORCING.-Preparations hould be mide for forcing Asparagus in proportion to requiremerte. Good roots for forcing may be prodaced in abouts three or four years, if seed be sown in rich, deep wilh and good dreasings are afforded frequently. Booto thas grown will now be ready for lifting. Not mur gardens are provided with permanent beds for forcimg every alternate or every third pear, and heated is hot-wates nipes or manure. Such a method if, no doabt, the best, because the roots are not disturbelin the least, and being forced gently, they uaally prom atiafactory. Bat, on the other hand, very gool Asparagus can be obtained from lifted plants pronided they are atrong. The first atep in the preparation should be the mixing, turning, and wetting of frelk table manure and leaves. The material ahoild then be tarned several times at intervals of about four dy or so. A pit of suitable size may be filled with thin, or failing pits, auch places as Cacamber or Tonts houses may be used for the purpose. Tread in material down well, and when the heat begin to decline, cover with from 3 to 4 inches of soil. Thes place the Asparagas roots so that they juot toocis each other, and cover them with oil to whaterer depth may seem desirable, and if blanched headoan preferred, the light may be excluded. The mafice of the soil should not be more than abouts 3 inches or from the roof glase before it is notian by sinking. Kepp a test-atick or thermometer plinge in the bed, and do not allow the heat of tha matur to rise too high, \(75^{\circ}\) is warm enough, bat \(10^{\circ}\) hothel will not harm them. A single row of pipes wim afford what atmospheric heat may be required. When water is used, it abould be tepid. Atter lif "grass" appears, keep a moist-growing atmopphat of about \(55^{\circ}\). Another pit should be filled in ame way to come into catting when the fint il exbausted. A bed will not last good for a looke period than aix weeks, and it will commence to bees in about two weeks after patting the roots into in Bottom-heat may be obtained from hot-water piph and very good reaults are obtained by thin matis when care is used, but such heat is more app flactaate than that furnished by a bed of manure, be latter affords a moist heat, whilat the formert dry, unless evaporation pans are used undernemin the bed, or the pipen are immersed in watar anderneath. Keep

\section*{PLANTB UNDRR GLASB} By W. H. Bmiti, Gardewer. West Deas Park, Cuichirir
LATE-FLOWERING CHAYBANTHEMUMG.- When many flowere are required for cutting in thich font of December and January, the varieties which fal, ad ate, or which can be retarded, are very furnimbed especially if large vases have to be kept which we with fowers, for an mont of the flowers wich forced have ahort atalks, the long atemmed for w. anthemam blooms form capital materisl disbadeden These late varieties should not be much dison mor being then much more gracefal, and therefore of ase for decoration than the larger heavier bloo the house having a northern aupect is availabing n arietie may be retarded in their flowerins easily.
whenever there is no frost or it it not air gist When there in much dampness in the all fre-heat ahould be afforded, and air in amall given by the top and bottom ventilators Varieties for very late flowering ing, Lady Lawrence, Ethel, Mdile. Lacroí Ling. Lady Cawrence, Eolo pellow coloure

Symond, which is one of the bent for cutting parpones.

TREE CARNATION8.-These plante now coming into flower abould be afforded weak manure-water in liberal quantities. It need not always be applied in that way, as a small quantity of fertiliser (Clay's or other) may be aprinkled on the surface of the soil, a job wh ch may be readily done when tying and rearranging them. Carnations now require very careful watering, and to be kept free from aphis by occasionally fumigating the house with tobacco or the XL All compound. A genial growing atmoaphere, and a temperature of about \(50^{\circ}\) by night to \(55^{\circ}\) by day hould be maintained, with air left on at the apper and lower ventilators. Ia bright meather a light syringing between the pot will help to keep red-spider in check.

CAMELLIAB. - Those plante which have begun to open their flowers should be rather liberally anpplied with water at the rootn, provided the drainage is good, and they are not over-potted; weak manurewater may also be occasionally afforded them, that in, if thry seem to needit. Potted plants which may be losing their flower-bads, hould be placed for an hour in a tob of water, 0 as to enable the water to reach every part of the ball, the centre part having probabiy become dry.

AURICULAB.-These plante will now require very little water, but plenty of air, whenever there is no froat. Ia wet or very damp weather, it is a good practice to tilt the frame light at the top and bottom. The frame sbould face the euth, and be covered with mata in case of severe frost.

LILIUM LONGIFLORUM VAR. HARRIBI. - The bulbs for early forcing thould be parchaned forthwith and potted up, placing each balb inan 8 inch pos, iu turfy Jusm, leaf-mould, cow-manure in a dry atate, and coarse saad. If the oil be moderately moist, no water will be needed before the roots permeate every part of it. Plange the potted bulbs in a cold frame, in cocoa-nut-fibra refase, covering them to the depth of 5 inches. Hare they mact remsin until the ahoot is about 1 inch long, when it will be found that the pots are filled with rooti. The plants thould then be gradually inured to the light, and eventually pat into a warmer temperature.

DAPHNE INDICA ALEA,- A few of the plante may bo placed in a temperature a little warmer than that they have been used to, and not forced too hard, or the plants will be sot to lose their flowerbuds. A temperature of \(50^{\circ}\) by night and \(55^{\circ}\) by day will be afficiently warm.

\section*{THE HARDY ERUIT GARD界N}

\section*{Hy W. Pope, Gurdsner, Highclers Castle, Newbury.}
sELECIION OF FRUITS FOR BMALL GARDENE.
The select list of fruit given bsiow is intended for the ase of those who may have amall gardens, and are desirona of planting a few well-tried varieties of each kind, to afford a useful mupply for demert and calinary parpones.

Dessert Apples.-Irish Peach, King of Pippins. Cox's Orange and Starmer Pippins, Claygate and Adam's Pearmains; of culinary varieties, Kes wick Codlin, Stirling Castle, Carlisle Codlin, Annie Elizsbeth, New Northern Greening, and Damelow's Seedling.

Plums.-River' Early Prolific, Greengage, Kirke't, Victoria, Monarch, and Coe's Golden Drop.
Pears.-William: Bon Chrétien, Fondante d'Automne, Marie Louise, Doyenné du Comice, Maréchal de la Cour, Glou Morcear, and Josephine de Malines.

Cherries.-May Dake, Bigarrear Napoleon, Elton, Belle Magnifique, and Morello.

Apricots.-The Moor Park.
Figs.-As a trustworthy Fig in the cath, Brown Tarlisey is the best.

Gooseberries.-These may consist of Early Sulphar, Whinham's Iaduatry, Red Champagne, and Red Warridgton.

Strawberries.-Vicomtense H. de Thury, President, Ryjal Sovereign, and Waterloo.

Currants.-White Datch, Red Datch, Raby Castle, Lee's Prolitic Black.

Raspherries.-Superlative, and Yellow Antwerp.
Nuts.-Kentian Cob or Lambert's Fulbert.
Peaches.-Alexander, Grosee Mignonne, Noblesse, Bellegarde, Albatrous.

Nectarines.-Pitmaston Orange, Balgowan, Stanwick Eiruge.
Of these the Peaches, Nectarines Apricote,
and Figs, of course, require the thelter of a wall, one either west, south - went, or south, being suitable; all the rest may be grown in the open. either as pyramids, bushes, espaliert, or atandarda, at the cane may be.

FRUIT FOR MARKET PURFOSE8.-In planting for market parposer, a multiplicity of sorts ahould be avoided, and only thone selected which are known to be prolific, coming quickly into bearing, and of taking appearance, either in regard to colour or mize-colour rather than good quality being sought after in the majority of casee. A few that generally give a fair return are, of Appler, Mra. Gladatone, Devonshire Qaarrenden, Worcester Pearmain, Lady Sadeley, Red Aetrachan, King of Pippins, Cox's Orange, Gascoign's Scarlet, Warner's King, Ecklinville, Annie Elizabath, Lane's Prince Albert, Wellington, and Northern Greening.

Pears.-Williams' Bon Chiérien, Louis Bonne of Jersey, Bearś́ Clairgeau, Jargozelle, Fertility, Doventé du Comice, Binhop's Thumb.

Piums. - Rivera' Early Prolific, Mitchelson's, Denyer' Victoria, The Czar, Belgian Parple, Pond' Seedling, The Sultan, Monarcb, Belle de Septembre, Coe's Golden Drop, Prince Eaglebert; and Damson the Ciitenden.

Cherries.-Frogmore Earlv. Bigarreau Napoleon, Werder's Early Black, Bille Magaifique, and Morallo.

Gooseberries. - Whinbam's Induatry, Keepaake, Crown Bob, Red Warrington, aod Early Sulphar.

Currants.-Lee's Prolific Black, Black Champion, Red Dutch. Rebby Castle, and, if a white variety be required, White Datch is the best.

\section*{THR FLOW \&R GARD展N.}

BV BaILEY WADDs. Gardener. Birdsall Gardent, Fork,
HERBACEOUS BOROER8.-Tbe making of new herbaceous perenaial borders, ant the rearrangement of old ones, may now be proceeded with when the weather permits. New border should be arranged when ver possible, so at to have a broad walk on when eide, being more attractive in this way than when there is only a walt on one side. Besides, it gives more space to diaplay the planta, and the border need not be of an inordinate length. Now around, if of a strong loamy or clayey natare will be improved by charring the top apit; and it should be well drained and afterwards trenched 2 feet deep, mixing with the staple a good quantity of road grit. leafmould, and hort manare; but on the other hand, if the soil be light or aandy, or rests on sand, gravel, rock, \&c., artificial drainage may not be required, but a mixfure of atrong loam, cow dung and hort manure will improve its holding qualities-shese should be incorporated with the ataple on treaching it. When a new border is made on opponite aides of a walk, the width of the walk should determine that of the border on each ide, as it does not look well to have borders of less width than the walk. As a rule, a border \(y\) feet wide is sufficiently wide, for showing the plant from the walk, at a greater width does not allow of the plant at the back of it being seen to advantage. As a margin to a border ranning through a kitchen garden, a Rose fence about 5 feet high at the back maken a nitable dividiag line. For the purpose of the fence, atrong Larch polet, or a diagonal rastic lattice constracted from the ame, answer well. This may be planted with a \(f \in w\) climbing plants, Honeymacklen, Clematis, and Ter and other varieties of Roses. I am of the opinion that no kind of permanent edging should be used in the front of the borders, these being in the way of the flowering plants, and the stiff outline poil the effects of a border of mixed flowering plants. Nothing impoverishes the soil more than Ivy, Yeww, \&ca, and such edginga form the best harbour possible for the all devouring slugg. Grass-edging, when the turf is in parfect keeping, form the most appropriate margins for a border situated in a flower garden or pleatare ground. A border gives the most satiofaction when ite position is well sheltered, but exposed to the sun, and it is backed by shrubu. The planting in regard to the height of the plants, and the colonr of their floweru, and the seaton when they appear, is \& matter for careful atudy; and to enable one to manage it readily, a plan should be made to acale, and the position of each plant and group of I lants indicated on it. No two men will plant border just alike, and ecarcely any rules are of service, excepting very general oner. For inatance, it may be proper to plant bold clumpe of thowy plant at irregalar dis-
tances apart thronghout the borders, itarting at the back with Hollyhocks. Dellhinium Phlozes. Helienthas, Eryagium, Giant Fennel, Golden Rod, \&c. Rbeam palmatum, Kaiphofies Uvaria and glanceacens, and aimilar tall-growers: following these with Pannia berbacea is variety, Spirmes. Perennial Asters, Iaula glandulos, Radbeckias, Poteatilles, Pentstemons, the taller speciea of Campanula; Iris, Caltbs paluatris. Trollias earopma, Anemones. Hemerocallie in variety, and gradaally finish off with quite dwarf plante at the front.
At the present time divide and plant clamps of old. atrong-growing Pwonies, Phloxes, Helianthus, Iris, \&c., Which if planted at this season soon establish themelves in the apring, and flower atisfactorily in their meason. Plants in existing borders should have all dead and decaying foliage cleared off them, and the soil carefally pricked over with a diggingfork, following this operation with a dressiog inchen thick of well-rotted atable-manure and losm. The taik of electing the plants for filling a new border of any considerable siza is one of great interest, and thone who may not have had much experience, will have to devote a good deal of care and discretion to the matter.

\section*{FRUITS UNDER GLASE}

By b ceard Parere, Gardener, Goodwood, Chichenter.
the cucumber. house, -In keeping Cacumberplante in health and fraitfulnes, two fact should be borne in mind, viz, light cropping and a regular temperature. Moreover, there is always, during spells of fromt, danger from affording too great an amoant of artificial heat so that the night temperature often exceede that of the day. To allow this diaparity of hent to occur causes a weak growth in the plants, and leads to that pest of the Cacamber-house, red spider, making it apparance. Less syringing of the foliage ahould be done an the winter advances, and the almosphere kept moist by the use of evaporating pans, and by damping the walle and patha oceavionally in the daytime. Almost daily attention to sopping the points of the shons at the accond or third leaf is necesary; and the shoot should be thinty trained over the trellis, and no crowding allowed, or the foliage will soon become of a pale green anhealthy colour, and the flowera fail to set, or the fraite become deformed. Slight surface dressing of some fairly rich, friable compost should be afforded at intervale of ten day, the soil used being readeres warm by kepping it in baskets over the boilers. Weak liquid-masure afforded once a week is of mach value: bue if soot-water be used, it should be very weat, or the roots may be iojared by it, and the fruit made bitter. The day temperature of the Cacamber-house or pit may range from \(6 y^{\circ}\) to \(72^{\circ}\), and that of the night from \(63^{\circ}\) to \(65^{\circ}\), roof coveringe being affurded daring severe frost, as advised by zee in last week's calendar. Fresh air in mall quantity is always beneficial, and may be admitted for a short time daily, if it can be done without causing a check to growth.

TOMATOB - These plante have made good progress.and at the present time they have plenty of fruita in different atages of development. Since they were placed in the house, a gentle warmth has been maintained in the hot-water pipes, and abundance of air afforded by day, with the result that growth in stardy. and the plants have continued to produce flowers, and set them. Applying water to the plant requires care, or the soil will become too moint to ait their well-being. As soon es a frait begins to colour generally all over, it should be removed, that not taxing the atrength of the plants too moct. Con tinue to ventilate the house freely in favourable weather, but do not let the night temperatare fall below \(50^{\circ}\)

\section*{Variorum.}

Phenomena of Nature.-We hear of new Potaton and Scrawberries at Salcombe; and I know of one other place in the neighbourhood where new Potatos and Green Pean were enjoyed on Friday lant. Is it not equally unutusl to a brood of newlyhatched wild ducks on a pond, partially covered with ice on Ostober 29, while swallow-two only-were fitting over the surface in the aun an if it were September? It atruck meas very phenomenal-or, rather, Nature alightly out of joint. Ia it so? A. C Oct. 31, in The Weatern Morning News.

OORREOTED AVERAGE TEMPERATURE FOR THR ENSUING WEEK, DEDUCRD FROM THE OBSERVATIONS OF FORTY-THREE YEAKS, \(\triangle T\) OHISWICK. \(-42^{\circ} .6\).

National Chrysanthemum Exhibition.

The great exhibition of Chrysanhas passed, and the exoitement cessarily attending competitive displays of this character is now transferred from the Metropolis to provincial towns, where it will surely be maintained in varying degree, until the remotest part north of the Tweed has enjoged in its own degree of fulness the reign of the Autamn Queen. No such exhibition as we witnessed during the present week at the Royal Aquarium oould have been made in a season unpropitious to the growth of the Chrysanthemum, and that 1895 has been a favourable year has been clearly proved.

The Japanese section, whioh andoubtedly continues to be the one most popular with growers and with the pablic, was magnifioent. The bent oolleotion inoluded a considerable number of novelties, proving that in regard to varieties, progress is still made in the development of larger and better flowers, for the grester part apon types which have existed for some time. A word of warning is needed loy raisers and judges alike, that mere size of bloom, unaccompanied by refinement and a good habit of growth, should not be enooaraged, though in this respect there would appear to be greater disorimination exeroised than was the case some time ago.
Incurveds were as well grown years ago as we grow them now; but the quality of the flowers this year is, we think, decidedly better than it was last season, both in depth and finish. Apart from exhibitors, the general grower has logt his
enthusiasm for this seotion, whioh is probably becanse very much greater oare and skill are required to bring the blooms to perfection than are necessary in the case of Japanese varieties. A badly-grown incurved flower is by no means handsome, but is much less so than a Japanese bloom with incurved petals. On the other band, a perfect incurved flower is not devoid of attraction, and it is certainly worth enoouragement as being a very distinct type of flower. A few new varieties are exhibited this season, but the additions are fewer in comparison with the other types. In this respect it is satisfactory that the National Society recognises the desirability of encouraging the cultivation of every form, and whether or not they are to be seen in general collections, the Pompon, the Anemone, Reflexed and Single-flowered varieties, may be always found at this exhibition in more or less, though generally satisfactory, degree of perfection. Such types are pretty, and at least afford some relief from the larger and more showy varieties. The single - flowered ones especially are very attractive, and growers would be wise did they give them a little more consideration than is their wont.
Trained Chrysanthemum plants have always a place at the Aquarium Show, and to many persons they form attractive exhilits as representing a great deal of oareful and skilful work. A well-grown natarally-trained bash plant, not mercilessly, bat moderately disbudded, is however, an equally pretty objeot.
The table decorations and various devioes for exhibiting the decorative usefulness of the Chrysanthemum were deserving of great praise.
It is interesting during a seriek of years to obseive how different growers come prominently to notice, and for a time hold the field with conspicuons success. At the show under notice, the leading class for Japanese and that for incurved flowers were easily taken by a young gardener who comparatively recently commenoed to exhibit. The Societies' oompetition was won by the Southgate Chrysanthemum Sooiety, and in this oase also the whole of the forty-eight blooms were farnished by the same grower. The two leading classes at the Crystal Palace this year, and the same classes at the Aquarium last year, were spoils to the same exhibitor. In 1893, he took the leading class for incurved flowers at the National Society's show, but not that for Japanese. Blooms from the same collection will, we believe, be shown at Edinbargh, with what success remains to be seen.

Paris Notes. Of all similar gardens known to easily take first prize for town-squares. It has more than once been mentioned in these columns, but its gramy mounds, noble trees, and interesting flower beds, are always charming. The constituents of some of these groups may be enumerated. One consisted of a bed of Rhododendrons, with tall deciduous Magnolias interspersed. Another shrubbery consisted mainly of purple Hazel, kept topped, intermixed with Weeping Silver Birch, surrounded by a line of Scarlet Salvia (S. elegans), and bounded by a mired edging of Tagetes, zonal Pelargoniums, Ageratom, Verbena, Golden Feather, and other plants of like character. Another very effective arrangement was composed of a centre of tall Papyrus (Papyrus antiquoram), surrounded by Cyperus alternifolius and Panicum plicatum, and with an edging of Centaurea candidissima, alternating with plants of pink Iresine, An adjoining bed was componed entirely of Cannas,
and the contrast between the two was 2 lightful. The frost, however, had given notion that it was time to take up the Canom and the hint was taken in the last week of October both here and in the Jardin des Plantan
Generally speaking, there does not appase to Le much novelty in the way of garden decoration The beds near the Louvre are mach as the were in the days of Lours Philipps; and the same fine "sub-tropicals" which were used in th days of the Empire, are still employed elseerben, such as the fine Solanums, Wigandias, Ferdinem Musa-Ensete, Phoenix, \&o. These are zud plants for the parpose, but we have got man or less accustomed to them, and it is th to look about for others. Our own gardens and parks are not so much, if at all behind non, unless it be in grouping and in the arrangemant of colours, points in whioh the tasto of the French is shown to a degree which we annot or do not rival. Various Bamboos are coming into use, and very distinct and beatifal theo are.
It is obviously possible to have wo mooh od a good thing. "Ondulations" are everymbern advertised in Paris by the coiffeurs for the beoneil of the ladies, and the landscape-gardeners alo indulge to the full in this pleasing derico. It is a question, however, whether it is not oresdone, and whether in a small town-square or gar: en surrounded by stiff architectaral lines, 2 style of landscape-gardening more appropriste to the genius loci, would not be preferbibe Why, for instanoe, reproduce in the small gurdem of the Elysés the swelling mounds of the Puo Monceany?
The Limes and espeoially the Horse-Chestnatsin the Paris streets present a remarkableand in many oases a miserable aspect. In oonsequenoe of the season they have made a second growth, and whilst in the case of the Horse Chestnat, the drought of autumn seems to bave scorched be young growth to tinder, the frost of the lat fert days has seriously hart the fresh green of the Limes. What will be the result next springit will be curions to see.
However exoellent the Plane may be as stonn tree, it has its defeots. In the first place it in foreat-tree, and as suoh is out of place in astref avenue, where it speedily grows too big and bat be tortured into shape and out into moderte dimensions. Then, as in the oase of onf om Thames Embankment, the planters planted them much too closely, or, which comes to the same thing, they omitted to thin them sufficiently early, and dom many of the vaunted street avenues of Paris hior rows of scare-orows or clothes-props. Ronatb headed trees of moderate height and medium dimensions are generally preferable for stree planting, but they are not easilg athire able, as the nurserymen do not keep them in stock. Cratægus linearis (if that be the right name?) and the ordinary round-baseded false-Acaoias are well adapted for the purpoue Pyramidal trees may also be employed with ad vantage. Pawlonias are much used in Puilin bat would be hart by spring frost in Londen. Ailanthus makes an exoellent spreading treed by the Seine, and does not grow too large in thee oircumstances.
Here is a hint for our florists and marledr dealers. Along the quays not only may melh grown plants be bought for a small prioe, bou also small backets (say, half a bushel) of goo potting-反oil oan also be obtained. All who live is to do with amateur gardeners, or who 1 is is great cities, well know the difficulty tbina bre getting proper mould. The Parisians solved the diffioulty.
The meeting last month of the five Acaderid

Platyclinis Giumacea in Sir Trevor Lawrence's Garden, Burford, Dorkisg.
which conjointly form the Institute was a grand spectacle. The President of the Repablio was surrounded by the ministers and ambassadors in full tenue, the Academioians wore their preenembroidered coats and cocked hats, the doctors and professors their gorgeous and varionslycoloured robes. Horticulture was represented by M. Lion Sar, the President of the National Horticultural Society of France. English science was adequately represented by the President of the Royal Society in doctor's robes, and hy several other representative men. The whole soene greatly resembled an Oxford Commemoration, but with this very important difference, that whilst noise and rowdyism charaoterise the behaviour of too many of the undergraduates in our universities, the students gathered at the Sorbonne were quiet as mice in spite of the provocation afforded by an outrageously long address from M. Jules Simon, which it would have been preferable to have taken as read, as when read it proved most interesting.

Platyclinis (Dendrochilum) alumacea. -The aubject of our Sapplementary Illustration this week, Platyclinis glamacea, is sufficiently represented in collections in this country to be well known and highly appreciated. When properly cultivated, few specees of Orchids can rival this apecies in grace, the plant being of a compact habit of growth, and carrying its pendulons crowded recemes of flowers well above the foliage. The abje cs of our illuatration is from the collection of Sir Trevor Latrresce, Bart, Barford, Dutking, and carried more than one handred flower-apikes. The cultivation of the plant is comparatively eary, and it may be grown either in a basket or welldrained pot. In potting, a layer of epbagnam-mona whould be placed on the crocks, and the plant raised well above the rim, asing a compost consiating of equal parts of peat and aphagaum-moss. Platyclinis glamacea is at rest at this season, and should be accommodated in an intermediate-house; and when growth recommences it should be removed to the East Indian-house and placed near the roof-glase. The plant requires, when growing, to be liberally supplied with water at the root and crerhead, and the anderaides of the leaves occasionally ayringed, to dielodge red-upider, with which it is very liable to be infented.
royal horticultural society.-The next fruit and foral meeting of the Royal Horticaltaral Society will be held on Taesday, November 12, in the Drill Hall, James Street, Victoria Street, Westminster; and at 3 р m. a lecture' will be given by Di. Maxweli T. Mastres on "Sabstitates for Larch." The committees will meet as asual at 12 o'clock.

A History of Enalish Gardening - The Hon. Miss Alicia Amhersts history of Gardening in England, 1 vol., 8 vo , with sixty-tive illustrations of old Eoglish gardens, will be pablithed by Mr. Quabitch towards the end of the preaent month.

National auricula and Primula Society. -The annual general meeting of this Society was held in the rooms of the Horticaltaral Clab, Hotel Windsor, on October 30. The expenditare for the year was fif \(14 s, 4\) d, against receipta from abbecriptionp, £68 13s. 6d. The deficiency of £9 10s. was taken from the reserve fand, which now stand at \(£ 118\) Gd The exhibition will, with the permistion of the Council of the Royal Horticaltaral Society, be beld in the Dill Hall, Jome Street, Westminster, as heretofore. A fall statement of accountr, and schedule of prizes, will shortly be pablished. J. Douglas, Hon. So o
national Carnation Society (Southern Section).-The annual general meeting of the Southern Section of the National Carnation and Picotee Society was held in the rooms of the Horticaltural Clab, Hotel Windaor, by the permission of the members, on Qutober 30. M. Martin

Rowan presided, in the unaroidable abrence of Martin Smith, Eqq., Prenident. The financial atatement showed a balance in hand from lat year
 clasive of apecial prize ; entrance-feen, 78.6 d . ; total, £401 168. Td. The expenditare was £205 17 s . \(6 d\), leaving a balance in hand for the present year of \(£ 195\) 193. 1d. Twenty-aix members have been loat during the year by death and withdrawal. Againat this fifty-eight new members are added. It war decided to hold the next exhibition at the Cryatal Palace aboat the third week in Jaly. Mr. Jas. Dovglas is the Hon. Sec.

The Magpie Moth.--This pretty bat destructive moth (Abraxas gromsulariata) forme the subject of a leaflet recently insued by the Board of Agricaltare. The caterpillars of this moth occasionally cause aerious injary to the Gooseberry and Carrant cropu. They are sometimes also destructive to Apricot trees, and are frequently found on the Sloe and Blackthorn. These ceterpillara are often confoanded by casaal observers with those of the larva of the Gooseberry and Carrant aswly (Nematas ribesii), bus they are essentially diatinct. Copies of thia leaflet are to be obtained, free of charge and post free, on application to the Secretary, Board of Agricultare, 4, Whitehall Place, London, S.W. Letters of application addressed need not be stamped.

Chrysanthemums at Ravenscourt Park, Hammersmith. - Now that most of the parks under the control of the London Conuty Conveil have saitable atructures for their annual diaplays of Chrysanthemame, it would be a real boon to Hammermith (the home of the late John Salter. who did so much for the lower), with its 105,000 inhabitanta, to have something more worthy of such a progrennive borough than the present antiquated little conservatory attached to the library, and which contains abjat 150 plants, of good sorta, but grown and flowered under difficalties by Mr.W. B. Gingelle, the superintendent.

Chrybanthemumb in the East of London. -Twice a year, in association with the sammer exhibition at the end of Jane, and the Caryanthemum how which is hald in the early days of November, the committee of the People's Palace Horticaltaral Society offer prizes for the best-kept and atocked greenhoase. Ia each case, and especially so in the namer, a large number of entries is made; and in connection with the Chryanthemum show, some twenty entries were sent in. Saeing that the range of the area of the cumpetition extends southwards to Nen Cooss, then aloge the north side of the River Thames throuzh Stepney to Limehouse, Puplar, and on to Cabitt Town. Canning Town, then to Siratford, Lagton, and Walthamatow, and then from Victoria Park to Whitechapel, it is obvious a considerable space has to be travelled over in making the awarda, and a whole day is consumed in doing so. A large number-indeed, almost the whole of the greenhouses submitted for competition, are of home constraction, mall, more or less artistic in denign, but in which some excellent plants are grown despite antagonistic surroundiage. Ia order to place the competitors on a somewhat equal footing, it has been found necessary to make two diatinc: clanes-she one confiaed to the more crowded neighbourhoods foand in Mile Ead, Bow, Bardett Road, Siepaey, Limehouse, Cabitt Town, and such denvely-popalated neighbourhoods; the other class applying to themore open neighbjurhoods, auch as those abatting apon Victoria Park, as North Buw, Plaistow, Layton, and Walthamitow. It would aurprise a etranger to observe how generally the Carysanthemum is grown under glars, in atructures heated in a few instances by hotwater pipes or flues, and in many by oil ntoves. Some of the cultivators leava home at an early hour for the City, and do not retura till evening, having but little leisure to attend to their plants. Others follow avocations clone at home, and can give attention daring the middle of the day. The favourite plants of the Eantender, in addition to the

Chryanthemum, are the Tomato, Fachia, Zonal Pelargoniam, Mlumbago capansis, taberona-rooted Begonia, Anthericum variegatam, some excellent apecimens of which are grown; Ricinus, Ficus, Aralia Sieboldi, Cacti, varioun Ferna, Coleus, \&c., the choice being a very wide one. Tae Poople's Palace Horticaltural Society, by meant of its exhibition and lectures, is giving an immense impetas to plant cultare eart of the City.

People's Park, Devonport.-This beantifal park, acquired a few yeara ago from the War Office authorities, is now the freehold of the Corporation of Devonport. The total cost was somewhere aboat \(£ 10,000\). With charscteristic public apirit, the Corporations of Piymouth, Stonehouse, and Davonport, have been liberal in laying-out their new posseation, nor did they limit the carrying out of the work to local effort; for while the actaal laying-oat wat executed by local labour, the plan was furnished by and the supervision of the work entruated to Mesers. Robert Veitce \& Son, nuruerymen, Exeter. The park opened on Monday, October 28, by the Mayor of Devonport, Mr. J. Beigat James, in the presence of a large and infuential assemblage of the citizens and borough officials. To commemorate the event a Qaercas Ilex was planted by the Mayor, who, borrowing the language of another craft, declared the tree to be "well and traly planted." A public luncheon followed, at which Lord St. Levan (the Lord of the Manor), General Sir Ricesed Harbison, Dr. May, the Mayor, and other pablic officials were apeaker. The park is a great improvement and attraction, and ita excellent situation bas been mado the most of by the landacape gardener.

Suicide in Kew Gardenb.-Oa Taeiday evening, November 5, at the Charch Room, Richmond, Mr. A. Braxton Hicks held aa inquiry with reference to the death of Mrs. Lucy Maxwell Br walow, aged sixty yeara, lately reniding at Eze View, Alphington, near Exeter, who was found drowned in a pond in Kew Gardens, in front of the museam. on Sunday mornivg. Mrs. Richards, the wife of civil engineer, of 31, Gloncenter Street, Warwick Square, S.W., stated that the latter was the widow of Edward Maxwell Brownlow, of the old Eart India Company's Navp, and who had coms up to London to conault a appcialist, and by whose advice she went to stay with a friend at Kew Palace, in order to get away from the noine of London. Evidence was given that on Sunday morning she was misting from her room, and a rearch was made. The drawing-room window was open, and there were indications that deceased had leaped oat, and climbed over a fence \(5 \frac{1}{2}\) feet high, and thas got into the gardans. Her body was found lying in the water 9 feet from the bank. The jary retarned a veroict of suicide while temporarily insane.

The Agricultural Department in Abeqdeen Univeraity.-The firat, and an important, atep toward the conatitation of the Agricaltaral Department in Aberdeen Univernity war made on Monday, the 4th inat., by the appointment of Mr. James Wilsoy, B.Sc., Lectarer in Agricaltare, Uaiveraity College of Wales, Aberyatwith, to the Fordjce Lectureship on Pribciples of Agriculture. The appointment is in form for a year only, as the fonds at the command of the University anthorities being in the nature of annual grants, it cannot bo put ou a permanent footing. With efficient teaching in the different branches of the zubject, Aberdeen University should form an excelleats centre of azricaltural education. Under the new arrangement, the Fordyes Lseturesh has been very conaiderably enlarged in its acopt and inatead of \(£ 40\), an formerly, the salary is now £́ju0.
"Guide Prati ue de l'Amateur de Fruits." -In this work of the nursery establishment of MM. Simon Lotis Fbeibes, of Metz, in given an account of the calture and a description of the different kinds of hardy fruite forming the pomological collection of the nursery belonging to the brothera Simon-Lours, classed according to their merit. An alphabetical list accompanie each section, giving the syonyms
of the varietien in Frencb, Eaglisb, and German. The descriptive matter attached to each variety of frait is safficient for identification, and the number of varieties described is enormons. As an instance of the thoroughness with which the identification of aynonymous varieties has been done, we 6nd the Pear Fondante du Bois credited with 61, and Doyencé Blanc with 84 synonym!

The Profes8orbhip of Botany at Cambridge. - Profensor Marshall Ward has been - lected to supply the vacancy caused by the death of Professor Babingtons. The Univeraity is to be congratulated on this appointment.

\section*{Scotland.}

NORTH OF SCOTLAND RUOT, FRUIT, AND VEGETABLE ASSOCIATION.
Tee annual show of this Association way held on Saturday, November 2, at Iaverarie, and, so far as the number of entries is concerned, it proved fally up to the avarage of previous years; and the fact that over 600 entries were made, shows that there is no lack of vitality in the Siciety. This year the Association has atarted ander new auapices, Mr. Alexander Giejg, Paradise, Iaverurie, having taken charge of atfics for the first time as secretary and treasurer. His arrangements on Saturday were quite tatisfactory, working an they did with harmony and moothnem.

\section*{Fbeit.}

Apples were a fiestrclas how. Here Mr. T. Midsleton, Monymuk; Mr. A. Middleton, Manar : Mr. C. Noonan, Iaverey; and Mr. A. Campbell, Thaisstone, gave a good account of themaelver. The display of Peare was considered to be over an average, the Ribatone Pippins, King of Pippins, Cellini, and Lord Suffield varieties being eapecially good. In this section, Mr. Oge, Fintray House; Mr. A. Gardiner, Kemnay House; and Mr. T. Middleton, Monymak, were the chief prize-winners. The colfretions of fruit were not 10 good, Grapen in most cases being indifferently shown. Mr. Ogg, Mr. T. Miduletud, an 1 Mr. Campbell, Thainstone, were the bett exhibitors.

\section*{Vegrtables.}

The display in this section was uncommonly fine, and the following caltivators are well worthy of menti.n for the excellence of their exhibitw, Memers. J. Ofston, Bourtie; T. Middleton, A. Middleton, W. Alexander, Cluny; John Brodie, Bogentarie; James Grant, Rothienorman; John Paternon, Sannybras ; and W. Mathieson.

\section*{Trade Notice.}

\section*{NEW COMPANY AT BOSTON.}

Wa learn from the Sheffield Independent that a now company is being formed ander the name of Mesnrt. W. W. Johnson and Son, Limited, for the purpose of acquiring the bueinese of Menmrs. W. W. Johnaon and Son, need growera, and wholemale and retail seed merchants, Boston, Lincolnshire. The amount of the share capital is to be \(£ 25.000\), divided into \(£ 10\) shares; 1750 preference share bearing interest at fire per cent, and 750 ordinary hares.

Scottibh Horticultural Association.A meeting of the Scottiols Horticaltaral Asmociation was held on the evening of the 5th inst. at 5, Sr. Andrew Square, Mr. R. W. E. Marray, Blackford House, the President, in the chair. There wan a good attendance of members. Mr. Robert Laird, the honorary mecretary, read a communication by Mr. Jamee Day, Galloway House, Garlientown, on the Pear. An intereating discussion followed the rending of the paper, for which Mr. Day whe given a vote of thanks.

\section*{LINARIA VULGARIS, WITH DOUBLE FLOWERS.}

Linaria vulgaria is a common species in Britain, but a doable form of the plant is extremely rare. A patch of the latter was discovered by Mr. Haddy, a reaident of Tavintock, on September 12 of the present year, growing about 3 milen distant from that town. There were at that time upwards of one handred flower-spikes, every one of which, the discoverer states, was similar in doubleness to the apecimen (fig. (6). If this character becomes fixed on caltivation, and the plant come true from seed, it will be a fretty addition to our border and rock plante.

Fig. 96--Linabia vulgaris, doubliw-flowered variett.
A, Spike, half nat. dize.
B, Bloom, \(\times 2\), showing central lobe of chiel lip greatly aztended and potal-lile st tip, with a three-lobed upper lip-interior growthe removed.
C, Same, showing interior petale-these are two to three-lobed, hairy lips three or four in number-sometimes with an abortive stamen attached.
D, Section, howing that the ioner growthe are petaloid stamens.
E, Inner growth, \(x\) t, mowing hairy lip-like growth, and aborted atamens.
T, A central hollow growth.

THE LADY MELON.
This illutration (tig. 47) is a representation of new Melon named The Lady, which has been rained by Mr. Owen Thomas, The Royal Gardens, Windoor, Mr. Thomas deacribes the fruit as of medium bize, cream-coloured, with a slightly netted akin, with palo, green flesh, tinted with red, which is very deep, and with an unuanally mall seed cavity. It is aloo free wetter and bearer, and Mr. Thomas conaiders it one of the best flavoured Melons.
Mesmra. Dicksons, of Chester, have been fortante in securing the entire stock of the seed, and purpons offering it for the approaching season.

\section*{Home Correspondenoe.}

THE PACKING COMPETITION AT THE CRYTAL PALACE 8HOW. - The judges who are selected by the Royal Horticultural society should have sofficient self-restraint to perase adverse comments on their award, some of which are beyond the mark, a for instance, those on p. 499 of the Gardeners' Chronich for October 26. I hhould, as one of the judges at the Cryatal Palace Show, be inclined to take no notice of those remarks, but as they are of a minleading character, I will, in justice to myself and colleaguen, britfly reply. I will take the first complaint, vit, that gardener are not considered to be capable judges of packing, but why not, and why should market-nalemen be preferred? Gardeners who have to pack a great deal of their produce are an capable as any saleaman of packing well for travelling long distances. Bat here my critic is wrong, for pardener were not the judges, but a gardener and a gentleman who may be termed one of the beth authorities on the subject, as he not only offereds prize for packing, but ent examples of properlypacked fruit; indet d, his froit, owing to the superior packing, oblains a better pice in the market that that of other g'owerf, and be grows largely for market. Another point is the distance the fraits are eent. I am not ane that Mr. Harris can mean this seriously, Devon and Corneall being as far to send as Ledbary, but I do not think the diatance in so important a point as my critic appeass to do. Most of us who have to send fruit, koow that it will travel 300 milea equally a well as 20 ; indeed, a short distance with several cbanges is worse than a longer with only one, op perbaps none at all. As regards the fruit here, 1 pack much of the choicer fruits, and they have to travel more than 300 miler, with three changet during transit, and therefore I know something of the zabject. Now, as to the two boxes tied together, the jadges at first were not sare if they did right in noticiog the boxes at all ; it may be convenient to tie several boxes together, but it is certainly not fair to fasten a heavy box to a light one; for instance, Grapes to Pears, or Apples to Peaches, fors by that means the heavier box, to a certain exteant protecta the lighter one. This matter was thratied out a few years ago at the Chiswick compedition and each package should be separate. Mr. Harrih would do well to look back at previous show, and I certainly asy that it is a fault, and we are alway to consider the market question entirej. The Royal Horticaltaral Society and othera gevic these prizes as apecial or open prizer, and my critic was 3 rd in one clam, and becanse he failed in tho others, he rushen into print, condemning the judga, who have other than the quention of packing for market to consider; and in a competition of this they must interpret the sense of the achedale, could have diaqualified some exhibitorn by resuon their not stating the cost of grading, boxes, wast and materials uned, and being thus lenient, we Mo condemned. If we had not considered cost, McIndoe would have been an easy lat, a his pad. ing was aplendid, but contly; whereas that of tighty Harris was the reverse, as his fruits were wedged in with mose, and, I should think, dime maler get at. Packing of this eort rendersit difficult for sherg men to judge of the quality of the fruit withont tatime, it out of the box, and this trouble, in a buty nous is not liked by the trade. Peaches packed in taker never have a nice appearance when the lid a farble, off, and wood-wool or paper-shavinge are prould al as it allows of ready inepection. I done readils, that the beat packing is that which is My colleugren and with the leat labour and conto My collof fo find who also judged with me last jear, expected wigh a diatinct advance; but if any, it
and I may inform Mr. Harris that the Peaches in the prize list, packed in mose, would have failed to receive an award had others complied with the achedule, as in one, a very good box, there was one bad fruit. We may have been wrong in our decision, but we think there is a much neater material for packing choice fruite than common mone. One of the Judges.
our begt and the most popular varieTIE8 OF APPLEB.-One of the mont pleaving festures of the recent great fruit show of the Royal Hi rticultural Society at the Cryatal Palace was the extrete popularity of our two best dessert Apples. The only two that exceeded a hundred diahea were Cox's Orange Pippin and the Ribston Pippin. The former was represented by 122 dishes, the latter by 111. The fact peak volume for the appreciation of these two excellent varieties, and almo for the solid advance of Apple caltare within the last quarter of a centary, and eapecially in the latter portion of it. King of the Pipping, too, fights atoutly for a apremacy that it seems to have attained at one time, and ataged ninetyeight

Golden Reinette among the aingle diahes. Can it be that the Ribaton Pippin to-day is valued at 122 to 1 as againet either of these threo goldea Apples? D. T. F.
fruitina of musa cavendibhil.-I have been repeatedly told that this could only be accomplished by planting out ; bat this is evidently an error, as we have succesafully grown and finished a 7 lb . buoch from a pot plant. The "fingers" weighed six to the pound, and the buach wat cut as aon as the leavea began to turn yellow, the fruit ripening about a week after it was cut. The fingers were short, plamp, and perfect in flavour, and the whole matter was so simple and succesaful, that the statement as to the prime necessity of planting-out is evidently a mistake. Beds in tropical houses are such an anmanageable harbour for vermin, that wo have done away with them entirely, and it is evident that they are not a necenity. The freah crop of Cocoa-nut is now in, and those who are interested in curionitiea will be plesued with the result if they obtain one with the outer hask on, place it on it aide, half buried in a large pot filled with Cocoa-fibre or mand.

Fig. 97.-the lady melon. (gre p. 554.)
disher. From this stage, size rather than aterling quality led through aeveral varietien, thas atrongly aaserting its force and power. Fortunately, however, it did not assert ite footing until the fourth place was reached, and then that wonderfal Apple whose origin and progress read like a popular romance, leaped up to an entry of seventy-nine dishes. This has proved a record year for this fine Apple, which by not a few is highly prized for eating as well as for cooking. The number of dithee rapidly fell from the seventiea to thirties, through such sorts an Warner'n King, Cox's Pomona, Lord Suffeld, Emperor Alezander, 50; Worcenter Pearmain, Prince Albert. Bismarck, Blenheim Orange, 32 ; Wellington, 29. From the thirtie we ipeedily asak to the tens, through such popular sorts as Tower of Glamis, Alfriaton, Margil, Lord Grosvenor, Qaeen Caroline, Gloria Mandi, Annie Elizabeth, Duchess of Oldenburgb, \&cc. Oat of the 200 varieties of Applem shown in the 2000 disher, forty-five varietien were hown in quantities ranging from ten dishes to over a hundred dishee of one sort; and, as we have already shown, and repeat with peculiar pleasure and emphaais. Cox's Orange Pippin, the Ribston Pippin, and King of the Pippins, headed the liut. Over ninety Applea were also represented by single dishes; and it will atartle not a few growern to find Golden Pippin, Golden Ranet, and

If placed in a warm-house in any corner, or under the stage, it will start growing in about five or aix months; when about 2 feet high, it maken an exceedingly handsome and carious decoration for an entrance-hall daring the summer months. Thos. Fletcher, Grappenhall, Cheshire. [Our correspondent's bunch was a very mall one, and did not weigh so mach as the tip of a bunch of a planted-out Mua, which gardeners uaally cat off because it seldom affords fruit of creditable size. ED.]

MORELLO CHERRY-TREES AT sCONE PALACE GARDENS, PERTHBHIRE. - With reference to the above, Mr. Ward and Mr. Fish will, I am sure, regret to hear that the apleadidly-trained trees which for many yearn adorned the north wall of the wouth kitchen garden here, and which they and no many other old Scone men look back upon wit an much pride and pleanure, died some years ago. When I took charge of the gardens fifteen y!ars ago, there was only one remainiag, sud, as it wat in a very sickly condition, it wat taken out and a young tree pat in its place. The wall at present is farnithed with clean healthy tree which bear abondant cropa of excellent fruit every year. With one or two exoeptione, they were all planted before I came here ; how long before \(I\) am anable to find out, bet they at present appear to be about twenty-five years old,
and at already stated, are in excellent health. Thin year the crop was exceptionally heavy, and the quality of the fruit above the average. As atsted by Mr. Fish, the aspect is almost due nortb, the divergeace being towards the east. The who'e wall was originally 15 feet in height, bat 3 feet wat added to the western balf when the large carvilinear orchard-house referred to by Mr. Ward was built about thirty yeara ago. The garden occapies low-lying aituation, the southern portion having a decided slope toward the north. The soil is a heary retentive loam, from 18 inches to 2 feet deep, reating on a bed of atiff yellow clay of unknown depth. In this soil and aitaation fruit trees and buahes are late in coming into blossom in apring. which, in oar somewhat changenble climate, is, in my opision, rather an adrantage. The drainage. which is very imperfect, consiste of old-fasbioned atone or rubble drains, about \(2 \frac{z}{3}\) to 3 feet deep, and placed at wide intervals. The border in front of the wall is 12 feet in width, and was planted with Lilies of the Valley about twenty years ago, and bas never been renewed since. They cover the sarface of the ground with a dense mas of foliage every aummer, and, like the Morellow, thrive admirably, and bear a heavy crop of fine atrong blooma annually. With the exception of careful pruning and training in the usual way every winter, the Morello are left pretty much to take care of themselves. No manare of any kind is applied at any time, ouless it be an occanional watering with liquid from the farm-yard daring the aummer months; but this is given mone for the ake of the Lilien than for the Cherriet. We have never examint the borcer to see where the roote are, but I have no doubt they bave penetrated the atiff clayey absoil long ago, and jadging from their healthy appearance and the fine crop they produce annually, ther seem to like it. We therefore let well alone. A. McKinnon.

A BOYCOTTED INDUBTAY,-When, some core of yearesince, the late Dr. Ball and his compatriot adventared into the north of France from Hereford, taking with them the finest specimens of Apples and Peart, and the cyder and perry produced from Foulinh orcharde, they left behind them a graod indantry, and abowed our French friend how very Jar we have adranced in both directions the growing of the frait and the manafacture of as good a pair of bevarages as it is possible to bring together for the benefit of either tired or thirsty soule, and yet, almost ever aince that time, not the demand or the liking for, bat the rale of both cyder and perry hat been dealining-and event now acarcely is the legend "Cyder on draught here" to be found panted on the windowe if London, or other, fublic bousez or reataurante. lostead ibereof, but in quite eparate nstablishmords, one can get queationable tea, coffee, and cocon, \&ec, and most unquentionable mineral waters-about which there is no doubt whatever, as being well saited for "scouring and dying," this latter, an industry not at all contemplated by the caterer for refreshment. And so it has come to pan nowadays that the hamble and thiraty way farer must cither go thirsty on his way, or assiat in swelling the "bills of mortality" all mawittingly. And why is this? why should the good old Eoglish beverages of cyder and perry be unobtainable in the land our Bang rules? The great maen of our old hontelrien - the modern pablic-houses are in the hand of brewers and distillers - are, an it is asid, "tied-houres" - and they will have no rivals at the bar. Only what they make and supply is allowed to be sold; and so cyder and perry are boycotted. In years past the Leginlatare has been doing what it can to make thing amooth for "the trade," and in their gratitude they shat out all attempts at competition. It is not for un to point the way to a remedy-chat lies not for un co poine the our province; wo can only wy that it is without our province ; wo can only syy shat is it worse than "hard" that oo promising a feld for spoiled, ruined for the sake of such a questionable abatitute. E.C.

VIOLET PEAFUME.-In a Tour Round my Gardew, by Alphonse Karr, tranalated by Rev. J. G. Wood, the reader is cold that " the Violet alone refues to ceparate its odour from itself; it it to be met with nowhere but in it own corolla. Perfamers are obliged to make, with the root of the Floreatine Iris, a certain false and acrid Violet odour, of which every returning apriag compel us to acknowledge the insufficiency." I would like to know if this in still the case, or if the difficulty han been overcome? William Cuthbertson, Rothesay.

RIPE STRAWBERRIES. - Some two or three weeke ago, 1 noticed in the pages of the Gardeners' Chroniole that a correapondent had been gathering ripe Strawberries from outdoor plants, which is certainly of extremely rare occarrence in the month of October. We have at the present time a magnificent crop of ripe fruits on two of our Strawberry beds, and hope to continue picking for at least another week, should the weather keep mild. Geo. Burrows, Berwick Gardens, Shrewsbury, October 21.

Chou de burahley. - Your correspondent, W. Joues (ou p. 463), drawsattention to this conical ahaped Cabbage. I have grown the vegetable for some yeara, bat more becanse it is a good antumn Cabbage than for obtaining - what shall I say, a CanliflowerCabbage. I have never detected the slighteat tendency to form a Cauliflower, though I have sown and grown it at all seasons. It in very hardy, and makes a good dich all through the early winter. The aecond week in Jane is a very favourable time to sow the weed. A short time ago, when visiting the seed grounds of one of our largeat seed-growers, I was informed that this vegetable was by no means a popular Brassica. I grow it largely becauas it is liked here, and is ready to cat at a favourable time for making a change. Oae cannot have to many kind of vegetables wherewith to make variety. W. A. Cook, Compton Basset, Calne.

Late raspberries. - I have never known antuma Rapperries so plenti'ul as they have been this year. We bave been gathering daily for some time, and even after \(5^{\circ}\) of fros \({ }^{+}\). This fruitis not only obtained from the so called antumn varieties, bat from eummer fruiters as well, notably Carter's Prolific, and the fruits are of large siza, and excellent flavour. It is ancertain whether or not this will affect the crop next season. Of coarse, the forward bude which the tropical weather during the month of September developed, will have already exbanated themselve, tat I fiad the fruit is from the very uppermost buds, which in our case, would have been punned away. The effect will be awaited with a certain mesaure of anxiety. W. A. Cook.

SHARPE'S VICTOR AND VALE OF CLEVELAND POTATOB.-I was much insereated in "R. D.'s" informing note on this matter on p. 464, as during my couraes of lectures in Cambe, I strong recommended Victor as the earlieat and beat early, for mall gardens eapecially. I read "R.D.'s" letter with special attention on this account, to see if this Vale of Cleveland was the yellow-fleshed Victor. Finding this to be the case, the mystery of the two being diatributed under different names becomes the greater. Bat both seedsmen being honourable men, the matter will doubtless be satisfactorily explained. My chief object in noticing this intereating incident is to cantion all concerned against growing the white-fleshed Victor, which in every case I have met with, is decidedly inferior, alike in quality and quantity, to the yellow-flethed Victor. Nem variethes of Potatos are often given to aport, and ran away rather widely from their original siza, colour, conatitation, and quality. Mearr. Sharpe and Short, or the representative of the latter, will probably be able to say whether the white or yellow-fleahed Victor was the original kind. Measrr. "Rom." and "A. D." must in the rich experience of their Potatolore have met with numerous aports more striking than the change of the yellow Victor into the white, or vice versa. D. T, Fith.

\section*{COLOUR IN APPLEB.-At a recent meeting of} the Frait Committee, at duly reported at the time Mr. Miles, of Southampton, sent a good-sized and richly-coloured Apple, which he deacribed as a Blenheim Pipp:n, the remarkably high colour shown being prodaced by frequent applications of sulphate of iron and soot to the roote of the tree during the past few years. Naturally, this statement was received with some incredulity. To me the Apple represented a moderate-siz-d, roundish Mère de Méaage, and on comparing it later with other of that name, I could discern no difference. Can the sender have been, aiter all, the victim of a mistake, or has he really discovered a method whereby generally green Apples can be made as red as Quarrendens? Perhaps Mr. Molyneax, who is often at Suathampton, may be able to aolve the problem. \(D\).

\section*{GAAPE CLABBES AT THE CRYBTAL PALACE.-} As a grower of Grapes and a gardener by profession, Ind Gros Cold know the reason why Groe Maroc and Gros Colmar are bracketed in Royal Horticulgrowth, time in finishing, and character of the finioh
the two varieties differ very widely. As to flavour, how can that be compared in two Grapes so widely apart in the time they require to finith their banche perfectly! I can alway have Gros Maroc finished and fit for eating six weeks before Gros Colmar, all other points being equal. To my idea, if we must bracket Grapes, Alicante would go mach better with Maroc, as they take in ripening and colouring about an equal amount of time, while flavour is not 0 very wide apart. Caltivators of Grom Colmar are greatly handicapped by the present chedule arrangement. Robt. Grindrod,

A DRILL HALL 8 HOW.-Any person not familiar with an ordinary Drill Hall gathering would naturally assume, on reading the reports a admi rably farnished in the press, that these shows must be of a very extensive nature. But if they be not \(s\) extensive, they well repay visit by the exceed ing variety found in them of most interesting objects. I overheard a remark on the 15 th that the how wat a mall one. I could but think that the observation was singularly misplaced. For an October show, collected without a single penny as remaneration being offered, I thought it a remark able one, and easentially representative. How many objects of the greatest interest Fellown, as well as the general public, lose who do not attend the Drill Hall meetinge! One year's regular attendance conatitute a liberal education in horticulture. Pity it is, that being so attractive, they are as a rule not more popalar, Fellow.

DIPLOSI8 PYRIVORA.-Can any of your entomological readers who have studied the above peat render any useful information relative to the prevention of one's Pear tree from being attacked by thil intidious and destractive little midge, Cecidomys ab-genus Diplosis? Oar blossoms seem to be worme attacked by them year by year, and that, too, notwithstanding the precartions taken, viz, last satumn we removed all the loose arface soil to a depth of about 2 inchen from around the garden Pear trees, wheeling it right away and replacing with maiden loam, \&ce ; but the attack was just at bad as ever the following opring. We then used fresh hot gat-lime all round about and underneath the trees, just about the time the first chrysalids began to fall; moreover, we collected all the fallen tiny Pears, and burnt them. I should like to know what more can be done to annihilate the enemy, or whether I may expect to be again tormented by fresh attack: from Diploaip, bred on my neigh bour's premises, because if so, Pear cultivation, if the plague be not stayed, must soon be reduced to a low ebb, owing to the repeated destruction of the crop. From five to twelve is about the average number of larva found in each little Pear, bat I have counted as many as sixty in one fruit; and sometime only one of the larra is found in a fruit, bat this is afficient to destroy that fruit. In some casen, every blonom on an entire tree is infented, and the consequent failure of crop. Any acrap of practicable information will be gratefally received by fruit growers and W. Crump. [Have you tried by frait growern and W.
apraying the blosom? ED.

TOMATO8.-For nome yearn it hat been my practice to make a aowing of Tomato seed about this date for early fruiting in the vinery that is started about New Year's Day. Thene plants set plenty of fruits before the shade from the Vines becomes heavy. Mont gardeners have their favourite varieties for early cropping, and I find Ham Green Favourite excellent for fruiting under Vines. The seed is sown in well-drained pots in rather sandy soil, sandier than that I make ute of in the pring, the seedlings being apt to damp off at this zeason. The seedlings are grown on without check, and with but little water, especially until the pots fill with roots. A place on a shelf near the glase in the plant-atnve or other house having a temperature of \(55^{\circ}\) to \(60^{\circ}\) will anit them. The plant thould not be allowed to grow without mupport being given the atema, and they mast not be over-potted. It is aurprising what fine strong plants may be grown in 32 's up to the time of affording them their last ahift in the spring. H. Markham, Mereworth.

CRAB TAEES - I am glad to see in your columne that various writers are extolling the beauties of the Crabs. Crabs in the garden look very well when planted on opposite nides of a path, and the stem trained over it, so as to form a covered arched way. When the tree so planted come into bearing, and thousand of fruit hang down from them, the aight once seen is never forgotten. J. Macers, Marazion.

\section*{SOCIETIES}

NATIONAT CHRYBANTHEMUY

RYSANTHEMUMS at the Aquariam on November 5,6 and 7 , exbibited uncer the, anthemum Society, up to the average in quastity and in quality. It is doabtul ever been staged than the best of those exhibind this week in the principal class for blooms of thit ection. Incurved blooms were also commendale being in our opinion of better quality depth and finish than those shown last meason. Other metions such as reflexed, Pompon, Anemone, and ninglflowered, were exhibited well in the few clamenderoted to them. Plante were about average in qualits, certainly not better than those exhibited on the last occasion of the annual show. On the lat day of the exhibition, the asaal dark character of the building was accentuated by gloomy wet weather, but fortuately on Wed neaday circumatances were mach more faroarable. Roporters for the prete alway labour under manal difficultisg when reporting a show held in tho Aquarium, and the arrangementa this year were vers far from atiafactory. No doubt mach of this is convenience is unavoidable in such a building, bat wo atate the case, as being our apology for any inac curacies or omisaions that may appear in our report

\section*{CUT BLOOMS.}

Society's Class.
The batt'e of the Horticultural Societies for honours in the class for forty-eight blooms, distinct, Japanese and incurm varieties in equal number, was engaged in by five conpetiterm and the 1st prize of \(£ 10\) and the Challenge Trophy was won by thy Southgateand Distaict Chrysanteremum Society, buthe whole of the blowms ware fuenished by one of its members, riz Mr. W. H. Lees, gr. to F. A. BEV AX, Esq., Trent Park, Barnot As this competent exhibitor entered in other large clases under his own name, the unaided efforts he made on behall of the society were very great. Of the Japanase blooms in thi stand we may notice Marame Carnot, Van der Heede.
Molyneur. Thor. Wilkins, Mrs. W. H. Loes, Vivial Morel, Louise, Chas. Davis (capital colour), Sunflowes Eva Knowlee, Mutual Friend, Col. W. Be smith Giss Rita Schroeter, and Mdlle. The ess Red, ane all Which were of excellent charactero The Incuress, Empress of India, Lord Aloester, J. Agate, C. H. Cartien Queen of England, Jeanne d'Aro, Lady Harding, and Mr. Heale. The Bromley and distriot Chrysayteneyoy Society were successfut in takiog 2nd place, and the exhibit was very praiseworthy. Included was the bof coloured bloom of Hairy Wonder we remember to have wow 3rd Brigeton and Sussex Horticultural Societs

Open Classes.
Incurved Blooms.-There were but two exhibits in the dim for thirty-two blooms, incurved, distinct, and the lat prith iv. Challenge Cup and \(\mathscr{L} 10\), was taken by Mp, W. H. \(-B 4\) who again had firet-class blooms. The varieties were-Bud row: J. Agate, Globe d'Or, Mon9, R. B hhaant, Empressod Indie, Prince Alfred,C. Curtis, Lord Wolseley, Queen of England, Bam: Hirsch. Miss Haggas, W. Tunnington, J. Lambert. Mader Lady Harding, Princess of Wales, J Doughty, Golden Empris Joo. Salter, Empress Eugéaie, Violet Tumlin. Mra, Hent Altred Salter, Lord Alcester, Bobert Petfield, Lord Ros byry Altred Salter, Lord Alcester, Robert Rin des Plantes, Nil D. perandum, Mrs. Coleman, Princess Beatrice, Madam Darier, Chas。 Gibson, M. P. Martignac, Lucy Kendal, Hat of Stoke Newington, Refulgence, and Joana was wel Though the only other exhibitor, the 2nd prize wamaide deserved by Mr. W. Mease, gr. to A . TATE, Esq.o, Downemed Leatherhead; his stand, however, brighter had more light-coloured Gloke d'Or Lard Alegitecolenred varieties beres of I Globe d'Or, Lord Alcester, Alfred Salter, Empres d'Are, mo Princess of Wale
The best twen'y four incurved blooms distinct, weve form The best twen'y.four incurved bloms distinct, wallith Piace, Bishop's Stortford. The flowers were not very bey but were compict and pretty. The hesviest were sho pretty blooms of Alfred Salter, Lady Hardinge, Jeanne \({ }^{\text {d }}\), Lord Alcester, and Jardin des Plantes. Mr. T. Robinoor Lord Alcester, and Jardin des Plantee. Lairrenct, Esq., Elsfield Hou*, Hollingboume, wal so W. Laifrencte, Esiq., Elsfield Hou*e, Home wis M, A. Haggas, and Mrpos. Coleman. 3ed, Mr. W. F. TrDP, Brat hampton Nurseries, Havant ; and 4th, Mr. H.
F. Crisp, K If. White House, New Southmate. late J. Mas Mr. J. H. Walker, gr. to the Exors. of the late do bes crall. Eiq., Goldbeatera, Mill Hill, N.W., staged one The \(t\) welve blooms, and the exhibit was a commend Alcester fine), Jao. Lambert, Golden Enapress, Jno. Douzht o, Madame Darier, Brookleigh Gem. Endia, and Novelty, Zod, Mr, R, Ridge, gro.

Eadr. Esq., Oatlande Lodge, Weybridge. His best blooms were Priaceess of Teck and Jeanne d'Arc. Mr. R. Joue3, g.
to C. G. Smith Rylayd, Esq. Birford Hill. Warwick. was 3 d; his blorms wese wide but not deep. 4th, Mr. A. Jones \(\mathrm{g}^{\mathrm{f}}\). to Miss Wyburn, Hadley Manor, Barnet.
The best incurved blooms of one variety were exhibited by Mr. J. H. Walier, who selected Jeanne d'Arc, which he showed very well. 2nd, Mr. B. CALVEBT, who had Alfred chot Madame Darier as his variety. There was considerable competition.
Japanese Blooms. - The opinion was generaily felt that the \(J a p a p e s e\) blooms were of better quality than she incurved, although the latter were better than last year. The leading clasg was unusually strong, and apart from the 1st prize
exhibit, the collections caused considerable difficulty to the judger. Mr. W. H. Lees, gro to F. A. BEyAN. KqG., Trent Park, Barnet, was an easy lit for the Challenge Cup and \& 10 , ard his blooms were fine without exception. The varieties were:-Frcnt row: Mrs. W, H. Lees, Reine d Angletorre,
Phoebus, Miss Dorothy Shea, International, Chas. Devi, Mons. Panckoucke, Van der Heede, Madame Ad, Moulin, Ed. Molyneux, Viviand Morel, W. G. Newett, Chas, Shrimpton, Thos. Wilkine, Mra, C. H. Payne, and Madame Carnot. Middle row: Wm. Seaward, Louise, Madame M. Ricaud, Mephisto, Wm. Tricker, Monso G. Biron, H. L. Suaderbruck, G. C. Sch wabs, Madame Ad. Chatin, M. Ad. Grand, Mutual Friend, Beauty of Cabtlewood, Visc 3 , Deuil de Jules Ferry. Front row: Colonel Smith, Presideat Borel, Guirlande, Eva Knowler, Madame A. de Galbert, Mrs. Falconer Jameson, Sunflower, Jno. Shrimpton, Miss Rity
Echroster, Mons. Chas. Moli n, Souvenir d'une petite amie, Hairy Echroster, Mons. Chas. Molin, Souvenird'une petite amie, Hairy
Wonder. G. W. Childs, Puritan, Henri Jacotot Fils, and Mdlle. Thée èe Rey.
The judges had diffizulty in awarding 2nd and 3rd places. Eventually, Mr. Wm. Mease was awarded 2nd prize; and Mr. W. Wells, Earlswood Nurserier, Redhill, 3rd.
In the former exhibit, blomma of Miss Dorothy Shea, Silver King, Viviand Morel, Robert Owen, and Mille. Marie Hoste, The especially fine.
The best collection of twenty-four blojms, distinct, was
shown by Mr. W. Messenger, gr. to H. A. Bervers, Esq. shown by Mr. W. Messenger, gr. to H. A. Berrers, Esq.
Woolverstone Park, near Ipwich. He had an excellent lot of blooms, of which the followiag were the best, Mrs. C. Harman Parne, Etoile de Lyon, Waban, Mdlle. Thérèse Rey, M, Panckoucke, Madame Carnot, M. Grayer, Mrso G. J. Beer, and Mis D. Shea (a Silver Cup, givea by Mr. Joner, acsonpanied the ist prize). The 2nd place was given to Mr. O. W. DRake. Cathays Nureeries. Cathays Terrace, Cardif, colvur fairly deep blooms. The following were the best, Mrs. H,
Payne, Lord Brooka, Madame Carnot, Dorothy Shea, Madame Zurich, Viviand Morel, and Ed. Molyneux. 3rd, Mr, W m.
Alluk, Gunton Park Gardens, Norwich; and 3rd, W. Herbert Towlif, Efq., Claremont, Taunton (gr., Mr. C. Hart), There was some diesatisfaction expressed with the result of the jadging in this class.
The best collection of twelve bloome, distinct, was shown by Mr. J. Agate, Chrysanthemam Nurseries, Havant, and of commendable merit they were, the weakest bloom being Miss
Ethel Addison, which thowed the centre somewhat. 2nd, Ethel Addison, which thowed the centre somewhat. 2nd,
Mr. H. A. Page, gr. to F. Crisp, Esq, White House, New Scuthgate, N., whose exhibit very nearly approached the lat one. Brd, Mr. J. Sandford, gr. to G. W. Whight-Ingle, Esi, North Finchley. 4th, Mr. H. Levey, gr. to M. Low, Efq., Warwick.
Six blooms of any white Japanese variety were best from Mr. R. Jones, who showed Mdlle. Thérde Rey in good charac-
ter. Mdlle. Marie Hoste, shown by Mr. J. Sandford, gr. to G. W. Wriget-Ingle, Esq., Wood House, North Finchley, was a good stand for 2nd 'place; and Mr. B. CALVERT, again thowing Mdlle. T. Rsy, was 3rd; 4th, Mp. T. Lodge, gr. to Rev. J. Menet, Hockerill, Bishop's Stortford.
Mr. R. O. Notcut. Broughton Road Nurseries, Ipswich, had the best sir blooms of sny variety other than white, exhibiting a new one called Edith Tabor, a broad-petalled, pale yellow Variety, of fige merit; 2nd, Mr. B. Calvert, who had Col, g nith, very good; 38d, Mr. J. SANDFORD, with Viviand
Morel; and 4th, Mr. Cor, gr. to JNo. Trotrer, Eeq., Morel; and 4th, Mr. C. Cox
Brickendon Grange, Hertford.
The leading place in the class for six Japanese blooms, incurved, distinet, was taken by Mr. R. Joses, gr. to C. A. were Miss Ethel Addison, Col. W. B. Smith, Louise, Ricard, Lord Brooke, and Prêfet Roberts; 2ad, Mr. T. Carter, gr. to A. G. Meissener. Esq, Weybridge, who was a very close 2nd. Hairy-petalled varietiss.-The best six Japanese blooms,
hairy-petalled varieties, were shown br Mr. W. WeLLs, Earlswood Nurseries, Redhill, Surrey. His varieties wereLouis Boehmer, White Plume, Lady of the Lake, Hairy Wooder (very wide, but thin bloom), Mrs. Higginbotham, and Mrg. W. J. Godfrey, a pretty white variety ; Mr. H. Love
was 2nd. King of the Hirsutes, a yellow one in this stand, is a good variety.
Reflexed Blooms, large-flowered. 一Twelve large-flowered rofexed bloome, in nine varieties, were shown by Mr. R. C. Notcur, Broughton Road Nursery, Ipswich. But fow additione are made in this section. The varieties staned were Cloth and Cullingfordi. 2ad, Mr. J. H. W ALKER who incladed blooms of King of the Crimsons, R. Smith, and Cheralier Domage ; 3rd, Mr. C. Brown, gr. to R. EEXTY, Eeq., Langley House, Abbote Bromiley.
Anemone blooms, large-flowered. - The class for twenty-four blourus, Japaje: Anemones inclu \({ }^{\circ} \mathrm{od}\), wa won by Mr. W.

Sleggs, RT, to A. Moseley, Req., West Lodge, Barnet. There was considerable competition in this class, and the 1st prize exhibit was very fine indeed. The varietios were, Duchess of Westminster, Fleur de Marie, Thermidor, Mrs. J. Benedict, Nelion, Grande Alveole, Fabian de Mediana, Gladys Spaulding, Cincinnati (very pretty), Jno. Bunyan, Lo Deuil, Acquisition, Mons. Ch. Leboscyz, Mrs. Leven, Enterprice, Descartes (eplendid). Jeanne Marty, Wueen Elizabeth, Macime LawBDn, M. Dupanloup. Delaware, W. W. Astor, Mdlle. Natalie Brun (very attractive lilec and rose culoured variety), and Sir Walter Raleigh. Mr. A. Ivee, gr, to E. C. JUkes, Esq, Hadley Lodge, High Barnet, was a good 2nd; and we noticed in his aland very grod blooms of M. Dupanloup, Sabine, mad
others. 3rd, Mr. J. Milner, gro to Mra W. A. Hisas, Willeaothers. 3rd, Mr. J.
hall Park, Barnet.
Mr. W. Sxeges was the winner also of the lat prize for twelve large flowered Anemones, excluding Japanese, and again showed well, but his collection was lacking caloured varieties: Mp, A. Ives was 2nd, and the 3rd place was taken Hadley.

Aneinone Japanese. - The class for twelve blooms, distinct, gave another lit prize to Mr. 8 kkigis , and his blooms were
very large, and most of them good io other respecto. Hie selection was the following:-Le Deuil, Joo. Bunyan, Nelson, Enterprise, Queen Elizabeth, Descartes, Jeanne Marty, Bir Walter Raleigh, Madame Lswson, W. W. Astor (with poor centre), Mdlle cabrol, and M. Dupanloup. The 2ad place in this competition was taken by Mr. J. Justice, gr. to Sir R. Temple, Bart., The Nash, Kempsey, Worcester. He had a deodedly commendable collection, and was followed by, Mr. J. Milemer.
Mr. J. Milamer.
Anemme Pompons. - Twelve Anemone Pompons, distinct. three flowers of each variety in bu эches. Mr. C. Brownstaged a very pretty collection in this class, and had lat prize. His varieties were Francis Boyce (rather too large in comparison with the others), Madame Leutier, Antonius, Madame Montels. Magenta King. Madame Chalonge, Mies Nightingale, Mr. Astie, Hegina, Kmily Rowbottom, Queen of Anemones, and Besgie Plight; 2nd, Mr. J. Myers, gr. to the Earl ol Sandwica, Hinchingbrooke, Huntingdoa. There were only two exhibits in this class, and both were of good quality,
Pompons. - Mr. O. Brown was the winaer in the clasifor twelve Pompons, distinct, three flowers of each variety in bunches; his exhibit was decidedly praieworihy, the blooms boing even and good; Mdlle. Elise Dordan is still the prettient flower in this section, but W. Westlake, Black Douglas, Harry Hicka, Mre. Bateman, add Chas. Dickens, are also capital diverse varieties. 2nd, Mr. B. Cahyer, whose collection was but little

\section*{Single flowered Varieties.-The show of single-flowered} prize in the class for twelve varieties in bunches or aprays was Mr. J. Mrens, and the whole of the flawert wera to good that we append their name:-Jane, Parity, Fnow Admiral Symonds, yellow; Mrs. D. B. Crane, very pretty pink; Nora and Foxhunter, coloured ones; and Miss M. Wilde, rose and white. 2nd, Mr. W. C. Pagram; 3id, Mro W. Wells.

The best collection of twenty-four blooms of Japanese ia not fewer than eighteen varieties, was shown by Mr. JAMES STREDWICK, Silverbill, St. Leonard's-on-Sea. A Silver Cup presented by J. M. Copper, Req., wis added to the list prize in this class. Mr. Stakdwick's exhibit was an excellent one, and included good flowers of International, Chas. Davis, Viviand Morel, Miss D. Shea, Wm. Seward,
and others. Mr. C. A. Jessop, Mildenhall Workhouse and others. Mr. C. A. Jessop, Mildenhall Workhouse,
Suffoll, also had an excellent collection, which we congidered equal to the one already noticed. The flowers in this case were very fresh-looking, bright, and of large sizo. Thomas Wilkins, Chas. Davis, Puritan, and Hairy Wonder, were the most noticeable; 3rd, Mr. H. Love, 9, Melville Terrace, Sandown, Isle of Wight,

Mr. W. Amies, Bouth Ashtord, Kent, was 1st in the class for twelve incurved blooms, distinct, bat the flowers were coly poor. The 2nd and 3 rd prizes wers taken by Mr。 \(\mathbf{G}\). R. Crowse, Long Ditton, Surrey.
The exhibits of six bloons of ineurved, dietinct, were better. The ist prize was taken by Mr. Chas. E. Wilisins, Welling. ton, Swanley Junction, and his best blooms ware Globe d'Or, Lord Wolseley, and Nil Desperandum. G. D. Wilils, Eeq. Hertford Cottage, Hertford Road, East Finchley, was 2nd Hertford Cottage, Hertford
Mr. JAs. STREDWICE took the ist prize for iwelve Japanese blooms, distinct. Ho had exquisite examples of Charles Davia, Viviand Morel, Mies A. Hartehora, Col. W. B. Smith, Autumn Tint, \&c. Mr. K. Love wab agood 2nd, and ubowed fine blooms of Good Gracione, Viviand Morel, Charles Davis, a 3rd Mr. Arthur Stammers, The Knowleo, Maldon, Eabex.
Mr. C. H. Martin won iat for sís Japanese blooms, diatinct. and his specimens of Charles Davis, Suaflower, Van der Heede were praiseworthy; 2nd, Mr. W. Perrin ; 3rd. Mr. J. Kmapp. For the beat six Japanese bloomas, of one variety, Mr. H. Love wan again lst, ehowing very well-coloured Sunflower; 20d, Mr. J. STREDWICE, with splendidy- colo
Morel; 3rd, Mr. W. AMIEs, with Chas. Davies.

Smale Hayded Oandeners' Classen.
Mr. S. J. Cook, gro to J. H. Hartaidee, Kiq., Holewood, Hendon, was the orly exhibitor of twelve incurved blooms, distinct. The best of these were Baron Hirech, Jeanne d'Are, and G. Olenny.
The bent six incurved blcoms were from Mif. W. Co
PAGRAM, whose Jeanne dirc. Baron Hirech, and Brook-

Jeigh Gem, were fairly good; 2nd, Mr, C. R. Wuruss: 3ed. Mr. C. H. Mutin, Rp. to E. H. Luvetos, Eq, \&ajmead Hendon, N.W.
The Japacese blooms were shown better, and the collection of twelve blooms, diatinct, from Mr. W. Perrin, gr. wo C. W Pichakns?n. Esq.. Sawbridgeworth, wese very rood, Mademe Carnot, Mille. T. Rey, Mra. Y. Jamenon, and C. Oos enjecilily the last-named bloom was extra deep, and the only ove of the kind we noticed in the exhibition. 2nd, Mr. W.C. PıGenM Colonel Chase and Good Gracious were remarked in thie stand, 3rd, Mr. C. H. M^Rtis.
Mr. H. Love had the best ais Japanew blooma distipct, and all the blooms were fairly rood, Golden Gate, if not large, wat very pretty; 2nd, Mine Anvıe L, GAUNT, Hilderthorpe, Boath nice in this stand: Ard, Mr, Jas, Stnedwick.

\section*{Metropolitan Clasers.}

Tbose are restricted to growern residing within the dintrict governed by the London County Oouncil. The best twelve incurved bloome, dintinct. and the only exibit for tas. came from Eraxk Bixcham, Keq, 6. Bothune Rod Btok Newington, and his bloome were very commeadeble for town grown plants.
Mr. J. Brooks, gr. to - Rey molds, Eeq., The Grove, Highgate, beat three other competitore in the class for oin incurved
blooms, with a very nice half-dozen hooms; FHaxk Biva HaM. Exq , followed; and Mr. W. Noble, Er. to K. T. Pitt Feq. Stamford Hill, 3rd.
Mr. J. Brooks was a very goo 1 let for twelve blooms of Ward Wese, distinct, which included fine examples of Mra. Dr, Wr to W. Mins, and W. H. Lincoln; 2nd, Mr. W. Davies, Hill: 3rd, Mr. W. Noble Eaq. Devonehire House, Stamford Hill; 3rd, Mr. W. Noble.
The best if Japanese, distinct, were from Mr. W. Davires, and he was very closely followed by Mr. J. Brooks; 3nd, Mr. G. Toltor, 20 . Albion Gardena, Hammersmith, W.
six large but not extra well-coloured bloome of Charies Davis won the clase for siz Japaness bloom, of any one variety for Mr. W. Farrow, gr. to G. R. Peerless, Esq.o Park Hill, Streatham: Col. W. B. Scaith (very fine in colour), abown by Mrom Mr. J. Brow wo the 2ad place; and the tame variesy from Mr. J. Brooks, wan 3rd

\section*{Epecial Classes.}

These were for prizes offered by trade growers and others Mor particular exhibits determined by the donors of the prizen. for sir vases of exhibition Japsuese Chrysanthemume, distinct, three blooms of each, one variety only in a vaee, with not leas than 1 foot of stem
The most successful exbibitor was Mr. D. M. Hayler, gr. to W. HAMMAYOMD, Keq, Teatorden Mall, Headon, whoee exhitite
 Fawham, Kent, was 3rd. The class for three blooms was won by Mr. N. Davis; and Mr. T. Caryer wes 2nd.
For the special prizes offered by Memrs. B. S. Williams \& Son, for dix blooms of the new Philadelphis, there were numerous competitor, some of the blooms being Very poor, gr. to 3. Commax, Kaq. Gatton Park Reigate : Mr. W Mease, was 2ad; Mr. Norman Davis, Canbsewell, 3rd; nod Mr. G. Foster, fr, to Hammond Spfacers, Eeq, Glendaragh, Kiggmouth, 4th

\section*{Grotys.}

There was oaly one class provided for grou \(2 s\), that in which the special ist prize offered by the Prenideat, Sir EDwiw SaUNDFRS, was competed for. Two of these exhibits were arranged wide by side at one end of the building, and they were both of reat excellence, each being very effec tive, but in style of arrangement quite different. Mr H. J. Jonks, Ryectuft Nurnery, Lewisham, wa awarded the lot prize, and no fault could be found with the deciaion of the judges. This group was forced of two bays arranged in an undulating manner, esch of which presented a bold front, the centre also being imposing, the recess between the two bays at the front being varied with highly-coloured Crotons, these also followed around each ride, and an edging of Isolepis at the margin. The varieties were chietly chosen of the Crotons, those with massive foliage, whilst here and there between the taller Chrysanthemums were narrow-leaved varieties, the background being rel:eved
by Cocos Wedelliana, well-furnished with healthy leaves. The Chrysanthemums themselves were the picture of health, with large, nassive blooms, the grester part of which were fit for exhibition bourds: fow dwarfer plants woald posibly have added the coneral elfect in the front, but severthelem it was a grand group, The lanche, Madume Théress Rey, Ioternationsl, Reine diApgle terre, and W. Seward. Mp, NoRMay Datis, butweryman, Camberwell, was the other competitor, and he worthily won the 2nd prize; this group did not present so impoaing an appearance as the former, the flowers being on the whole perceptibly amaller, yet of fret-class quality. The centre at the back was somewhat weak, s tall erect Juniper doing arvice where Cocos plumosa or a Bambura pracilis would have greatly added to the effect. Crotons and Dracsenss were here uued to give variety, the latter a trife too freely (D. tex. minali the variety), instead of which a few Eulalia juponica would have been better; Cooos Wedelliana, however, toll with good effect. The froat was well fiaished off with dwart plants of Japanese varieties; those most prominent through out the group were Chas. Davin, Madame Carnot (extra fine) Viviand Morel, and Louise. The 3 rd prize was awarded to

Mr. French, gr. to Mra. Barclay. Ambleside, Wimbledon Park, for a group more in the old-fashioned style, the fr

\section*{Specimen Plants (Trained)}

These were grouped around the two fountains at either end of the building, being thus seen to the best posiible advantage. The plants were not, perhaps, quite so large as usual, but this, inatead of being any detraction from, rather added to their appearance. Better all-round specimens could nct be possibly desired than those shown in the three following claases by Mr. Donald, gro to J. G. Barclay. Esq, The Green Leyton, Essex, in each of which he was awarded the lst prize, viz., for six named specimens of large-flowered varietie3 Japanese included; these were of glohose form, averaging
4 feet in dismeter, the varieties being Chinaman, bright purplish-violet-very fine; Gloriosum, distinct-very pretty; W. Tricker, good; White and Pink Christines, both excellen plants, well-flowered; Dr. Sharp, rich in colour, a fae plant.
For sir trained specimens (Pompons). with remarkably fine plants, not nearly so dwarf as usual, but all the better, the ariet'es were Golden Madame Marthe and lthe white or original form, both densely flowered; William Kennedy, dark rich red, with large flowers; Soeur Mélanie, of similar good quality; and Black Douglag, well known as one of the finest quality; varieties.
For sim standard (trained specimens), with plants having dense spherical heads on clean stema, each densely clothed with flower; here the varieties were Chinaman, Stanstead Surprise, extra good; La Triomphante. the flowers of good quality; W. Tricker, and Cleopatra, both good plants ; and
Madame B. Rendalter, very clean and freer. Mr. Donald was also an easy winner for one specimen plant any type, pyrawidal trained, with a well-balanced example of Meq., Cedar Hoase, Stamford Hill, being 2nd with a pretty keq., Cedart of Elsie.
plant of Elster exhibitor was also lst for four trained specimens,
The any varieties, a specially fine plant of Dr. Sharp being his best, as well as lst for four standard-trained specimens, here he had a very fine plant of Colonel Smith, clearly proving the value of this variety for specimen culture.

\section*{Table Decorations, Vases, \&}

These were amply provided for in one of the galleries, and a keen competition was evidenced in nearly every class save the two first in the achednie. In either of these casses the prizes were good, whilst the object of the Committee in providing such clases is a most laudable one, inasmuch as it should be the meane of popularising the Chrysanthemum in ways not \(s 0\) irequently adopted. Mr. H. J. Jowes staged a magnificent display in the class for a table of cut blooms of Chrysanthemums, any type, shown in any manner the exhibitor thinks best; 18 feet by 6 feet. The wall at the back had, to commence with, been draped with a pale green material, thus forming a good background for the flowers; these comprised splendid blooms of high-class exhibition quality. Some were arranged at the back on tall arcade-like arches; these chiefly consisted of yellow varieties. On each side were two tall vases appropriately filled with large blooms and such foliage as the Oak with its rich autumnal tints, also Bracken, Grasees, Virginian Creeper, \&c., all blending most harmoniously together. Other and somewhat similar but shorter vases were employed in front of these, these being filled with equally fiae flowers, whilst at the front were three lines of specially fine blooms arranged in giasses fixed into a fire-frame, thus forming an excellent substitute for the more orthodox boards. The best kinds noted were Chas. H. Curtis, a valuable addition to the incurved section, with rich deep canary yellow almost globular blossoms; Madame Carnot, the finest of the white Japanese Chas. Davis, of rich colour; and Amy Shea. Dwarf well coloured Crotons as C. Baronne James de Rolhschild. with Ferns, added to the effect, as did several fine cut fronds of Goniophlebiam subauriculatum. One vase was filled entirely with incurved varieties; the excellent arrangement proving that in good hands, these more formal flowers may be well dieplayed. The Gold Medal of the Society was most deservedly awarded to this fine exhibit

Mr. R. J. Orand was the only exhibitor in the next clas, for a table of bouquete, wreaths, sprays, se., to illustrate the decorative value of the Chrysanthemum. This was, on the whale, wearcely up to this well-known exhibitor's standard more time apent in the arrangement would have remedied this. The best things, but in questionable taste, were th anchor of bronzy-yellow bloome, the wreath, and the harp with several good sprays. A Silver Medal was awarded.
Mr. Hayler, gr. to W. Hanvaford, Esq., Tenterden Hall Hendon, was lst for three vases of twelve blomms in each, with the addition of other foliage; this exhibit was bold and effective, the flowers being informally arranged (quality here was also conspicuons), with the addition of very suitable foliage, as Cyperus alternifolius, Pteris argyreea, and Myrsiphyllum asparagoides; had these vases stood in a better position, they would have been considerably improved in appear ance. Mr. Prewett, swise Nursery, Hammersmith, had three somewhat eimilar vases, between which and the former achibit there was not much to choose; the flowers, however asicely showed to such advantage, but a good use had been made of antumal foliage. Me. Cuard followed with much taller vases, the additional height not boing any improvement in enect, but rather the reverse.
Tar three opergnes, there were tix oxhibits, these showing Priewetr, fwise Iuraery, Eammern arrangement. Mr. cany lat, his exhibit being a pleaving combimetion of pale roay
was a practical one when placed upon a dinner-table, which is more than can be said in every case; the larger flowers were confined to the base, graduas taken up by them. Mr. Merinot any too much room was dew, gr. to Dr. Paul, white and yellow were the two addibeing employed tions to the foregoing, the arrangement bing were dressed on tive. Some of the stands of other extibit.
For two vases of Pompons or Anemone Pompons arranged in ases, not lower than 12 or more than 18 inches in height, Mr. Webster's, gr. to E. T. Prestonv, Esq., Kelsey Manor, Becken Webster's, gro most creditable 1st, with rather tall pyramidal arrangements, one of yellow flowers with bronzy foliage, and arrangements, one of yellh with white with green foliage and berries. Mr nother with white win in this class, with arrangements of MERIDEW was 2nd
In the class for two hand-bouquets, some excellent examples ere displayed, Mr. WeBSTER winning with two very asteful bouquets, one consisting chiefly of single varieties o ight colours intermixed win choied bits outumoal an other light foliage, the other being composed of yellow and bronze colours. Mr. Newell, gr. to Sir EDWIN SAUNDERS (the President of the society), Fairlawn, Wimbledon, came in a close 2nd, the chief difference being that larger flowers were employed, but with good taste, one of yellow and bronze, and nother of pink and red, being the choice of colours; the leave f Aspidistra lurida variegata were used with the latter colour to a good purpose
class for ladies only, brought out soxe capital displays, notably in the lat-prize exhibit of Mrs. Newell. Victoria Road, Wimbledon, who evidently understands the correct principles of decoration, her basket being bold, yet free in style. The 2nd prize was taken by Mrs. W. Green, Jun with a smaller arrangement
In the class for sir blooms of any one variety of Japaneze, with foliage of any kind, set up in vases less than 18 inches in height, Mr. Felgate, gr. to the Duchess of Wellington, Burhill. Walton-on-Thames, was a distinct lst with an arrangement made of the variety Sunflower, both quality and effeot being conspicuous. Mr. Cook, gr. to J. H. Hartridge, Helwood, Hendon, was and with another yellow variety.
In the corresponding class for amateurs only, Mr. Enward Jones, 25, Malvern Road, Hornsey, was a most worthy lst with the best arranged vase in this section, it affording an excellent example of a vase arrangement; the variety was Viviand Morel, of pale colour, but fine flowers, group:d with Azales pontica foliage and Smilax, \&c. The 2nd prize went Azalea pontica 3 Macgravine Gardens, W., the variety to Mr. R. K. Wrmson, Mrs. Harman Payne; the effect also good.
As a hand-basket of natural autumn foliage and berries arranged for effect, Mr. John Mansey, gro to S. H. Smitri, Ksq.ostaged a very tasteful exhibit with considerable variety, and likewise harmonious blending of autumnal tints, the common Berberis in fruit, Mabonia aquifolia of deep bronzyred, and Clematis Vitalbs in seed were all used with good
effect. Mr. WM. Green, jun. followed again in this class effect. Mr. Wm. Green, jun., followed again in this class
with another good exhibit, rather more packed than in the lst prize basket.

\section*{Fruit and Vegetables}

Grapes were not largely shown, but were very good. Mr. W. Tidy, gro to W. K. D'Arcy, Esq.o Stanmore Hall, had the beat whites, in pretty clear-berried and medium-aized Muscat of Alexandris: Mr. W. Taylor, gr. to O. B. Bayer Rsq.. Forest Hill, wis 2nd, with larger but less-finished bunches; and Mr. J. BUBY, Byfleet, Sarrey, was 3rd.
In Blacks. Mr. Bury was 1st, with good-sized, handsome, well-finished Alicanter; Mr. TAyLor coming 2nd with large but somewhat ungainly bunches, though well-coloured; Mr. Calvert, gr. to Colonel Archer Houblor, Bishop's Stortford, was 3rd.
With Gros Colmar Grapes, Mro T. Eall, gro to W. Gardiver, Evq., Merstham, was well 1st, his bunches being handsome, well coloured, and with fine berries; Mr. TAPLor came 2 ad well coloured, and with fine berries; Mr. TAylor came 2 ad his clusters were largar, though lacking colour
Pears ware very fine and plentiful. Mr. W. Alwan, of with fine samples of Pitmaston Dachess, Marie Lonis d'Uccle, Darondeau, Doyenné du Comice, Marie Louise, and Emile de Heybt; Mr. Goldamith, gr. to Sir E. J. Loder, Horsham, was 2nd, having also very fine clean fruits of Pitmaron Duchese, Souvenir du Oongrès, Geaeral Todleben, Marie Louise, Beurré Diel, and Doyenné du Comioe; Mr. H. Marie Louibe, Beurré Diel, and Doyenvé du Comion ;
Apples.-There were eleven collections of six dishes of dessert Apples, the majority very fine, handsome, rich coloured, and of the best quality. Mr. Golismite was ist having beautiful Ribston, Cox's Orange, and King Pipping Amer, can Mother, Adams' Pearmain, and Blenheim Pippin Mr. T. Turton, Earley, was 2nd, having very handsome Jeffersons, Rosemary Russet, Adams' Pearmain, and Ribston, Cox's Orange and King Pippins, Mr. C. Ross, Welford Parl Newbury, was 3rd.
There were also elaven collections of six dibhes of kitchen Apples, thene being generally very fine. Here Mr. Tubton was 1st, with very large, handsome, and rich-coloured Mere de Méaagà, Emperor Alexander, Cox's Pomona, Lane's Prince Albert, Peasgood's Nonsuch, and Bedfordshire Foundling Mr. Goldsmith was 2nd, having also very fine Gloria Mundi, Peasgoon'a. Emperor Alezander, Gascoyne's Scarlet, Lard Derby, and Warner's King. Mr. W. T. Stowers, Sitting bourne, was 3rd.
Very fine collections of Apples and Pears were wet up by Messrs. W. Cutbus \& Sons, Highgate; Mesars.C. Lee Sons, Hammersmith; and Mesers. BPooner \& \$ons, Houds low, all of whom had splendid samplon, and in great variety also very etfectivoly staged.

Fegetables.-These important products seem at thit ohow to have somewhat fallen from their former high estate, perthaps because these products are not found at their bast in Noremben, For the valuable prizes offered by Messrs. Suttor \& Som Reading, for collections of nine distinct kinds, the quantitien in each case being too severely limited; only five latate vue staged. Mr. C. J. Waite, gr, to the Hon. Col. Talbor, Rate was 1st, having small Cauliflowers, Brussele spronts, nthen fair Tomatos; good, but spotted, Colery ; fair Aile nime Onions, Prizetaker Leeks, pretty Satisfaction Potatos, hand some new Intermediate Carrots, and Peerless Cucumbon, 2nd, having very good samples indeed, especially of 1 , mu Leekg, Onions. Parsnips, and Potatos; and Mr. J. Gibeon, Leekg, Onions, Parsnips, and Potatos ; and
to E. W. W ATTs. Esq., Chiswick, was 3rd.
The Society's classes for Potatos were well fillod, an on exhibito: in the person of Mr. E. S. Wiles, now at class for twelve varieties, he had very handsome modilim Kidney, Snowap, Supreme, Perfection, satisacima, Lan Dean, Puple Perment Rat having handsome but less fresh samples; and Mr. C.Osur, Sutton, was 3 rd . The same three took the prize is inuiver order in the class for six kinds; Mr. Wiles having Widowe Castle, Snowdrop, Satisfaction, Lord Tennyson, Pink Pertection, and Parple Perfection.
Mr. Empson, gr. to the Hon. Mrs. Wingrield, Ampthill, nont collection of fine clean Carrots in several varieties, \(u\), out by Messrs. Sutton \& Sons, which firm showel a wondent collection of Potatos, including fine tubers of Satidtaction Triumph, Windsor Cistle, and Magnum Bonum, and lang dishes of Early Regent. Ashleaf Kidney, Readiag Hero, Per fection, Harbinger, Reading Russet, Reading Ruby, Fint and Best, and many others, there being with seedlings and Pis apple examples, about eighty varieties. Mr. J. Berridge, gr to W. L. Unwin, Esq., Southall, had a very intereating on lection of vegetables, the central figure bsing a number plants of the popular climbing Bean, Tender-and-True, inpoh fruiting finely, and numerous Parsnips, Carrots, Potatom Bote Onions, and other roots, also green stuffy, in great variots.

\section*{Miscellaneous.}

Honorary exhibits were fairly numerous; notice was tive of those following:-Mr. Norman Davis, nur.aryman, \(\mathrm{Cum}_{\mathrm{m}}\) berwell, exhibited a few blooms of Chryssathemuma, reper senting some new varieties for 1898 ; Mrs. J. Shrimpton w one of the best of these; it is a large buff Japanes, mik broad flat petal, very high oentre: Jno. Beward is a hyo yellow Japanese, and Dorothy Seward a latze palo mom yellow Japa
Horticultural suadries wore exbibited on a stand by Mr, J. Geore E, 14, Redgrave Road, Putney, S.W.; and the Jisen Co., Limited, had a group of good Chrysanthemums in blam which had been grown from the cutting stage in the Jow Fibre.
\(\Delta\) capital group of Chrysanthemums in bloom wha put by Messts. J\&s. V Eitce \& Sons, Royal Exotic Nursery, Chath
which some old and many new varieties were weif shem.
Nine Chrysanthemum bloomas, in as many varieties, wo ent by M. Alfred Chantrier, Casa Caradoc, Byow (Basses-Pyrénées), but none of them were very noteworth.
Mesors. H. Cannell \& Sons, Swanley, Kent, had hy table magaificently furniched with sprays of zonal per goniumg of bright colour, and a quantity of Chrysantin blooms in coosiderable variety. Amongst the latur, bunches of Yellow Source d'Or were conspicuous,
Mr. W. Piercy, 89, Beadnell Road, Forest Hill, 8.E, wo Mr. W. Pax Mr. W. E. TIDY, Brockhampton Nureeries, Havant, funity large table wit
A grand lot of novelties in Chrysanthemume were ulomity Mr. Robert Owen, Maideohead, including a good chatir coloured Japanese, named Beauty of Sholing, flowered yellow Pompon, named Dolly.

Chrymnthemum Mra. Chaso Blick, \&c.
Mr. W. J. Godfrey, Exmouth Nurserie?, had aload i hundred blooms, repreaenting for most part Engliah seddiry raised by himself or others.
a protty group of Orchids and miscellaneous flowerisg oliage-plants was staged by Mesers. B. S. Wiluinss Imen Victoria and Paradise Nurseries, Upper Holloway, N. Victoria and Paradise Nurseries, Upper How were by Messore. Wililiams.
Messrs. D. and W. Buchanax. Forth Vinerards, had ally-tinted Vine Leaves, fod a fem Grapes and Toman

HAVANT CERYSANTHEMUX
Остовer 29.-To thil Society belongs the hou of opening the cycle of Chry*anthemame in no respect this, the twelfth it has held, wan in no reap quality.
The cut bloom clasess were liberally provided

Tivy, Brockhampton Nurseries, Havant. For eighteen and twelire Japanese. Mr. AGate, of the Chrysinthemum Nur eeries, was 1st, with remarkably fine blooms in both of the clastes
In the incurved section. Mr. Penford won in the class for twenty-four, and Mr. AGATE in that for twelve varieties,
both exhibitors staging very creditably. Anemone-fowered and reflezed varieties were shown in but moderate numbers, but the Pompons and single-flowered varieties formed an admirable feature. In the first of these classea, Mr. H. SNoor, 5. Fitzroy Street, Fratton, was lat for single-flowered; and Mr. Agate was lst with some really beautiful varieties shown as triplets in banches
Mrs Cowway, Havant, wes an easy lat in the dinner-table decorations, in which Chrysanthemums formed the major part. The Hall was rendered quite giy with a number of plants in pote, Mr. Tiny being let in the two classes.
Fruit formed also a creditable display, the prizes for Grapes falling 10 Mr. Penford and Mr. W. Mitohkir, gr. to J. W. Flemming. Esq., Chilworth Manor.
Mr. Cheaton, gr, to Sir W. Pink. Shrover Hall, Cosham, wan invincible in the regetable classes, winning two lsts,
Mr. W. E. Tidr, who is also the Secretary, had a quan of cut blooms of Chrysanthemums and other plants not competition, which were greatly admired.

\section*{WATFORD CHRYSANTHEMUM.}

October 29, 30-This exhibition, the tenth, was held at the Clarendon Hall, Watford, on the above dates. It was of the usual high character, the exhibits throughout being of the beat quality, and the entrie fell but very little short of those in former seasons. The fruit was the finest display that has been shown for some years.

\section*{Groups.}

In Division I., the group of Chrysanthemums were conapicuous for their effective arrangement; the firat a ward for a group on a space not exzeeding 50 feet was secured by Mr. C. E. Keyser ( \(\mathrm{gr}_{\text {. }}\), Mr. Gleeson), while the 2nd passed to Mr. W. K. D'ARCY (gro, Mr. Tidy). The prizes for a group of miscellaneous plants on a like space fell to the latter gentle-
man and Lord Esike (gro, Mr. Brown). In Division II., open to members only
In Division II., open to members only, the Chrysanthemum group awards went to Mr. Braltawaite (gro. Mr. Wearing), and the hon. secretary. Mr. C. R. HUMbERT (gr., Mr. Harvey). Mr. C. G. Motr (gr., Mr. Plummell), had the best group of
Chrysanthemums in Disision III., open to mem vers not emChrysanthemums in Division III., open to mem ers not em-

In Division IV. open to members employing one gardener, roup; while Mrs. Part (gr., Mr. Hill) secured late for aix Japaeese and sis incurved blooms, three table plants, and three Primulas. The other bloom prizes were given to Mr. Whelon and Mr. Rowlains.
The best vegetab'e collection in Division IV. was shown by the latter gentleman, while the fruit trophies passed to Mr. Braithelite, Mrs. J. F. Hill, and Messrs. A. and J. Wild.

\section*{Cut Bi,ooms}

The open first classes for twenty four Japanese and twentyfour incurved cut blooms were both well won by Mr. C. E. Keyser Both were very good, the finest incurved apecimen bing a Charles H. Curtis, which was the winner of the special prize for the best incurved variety in the show, and a similar award for the finest J ipanese bloom was given to a Madame
Carnot. Other very notice able bloomg ware Empress of India, Carnot. Other very noticeable bloomg were Empress of India,
Madame Darier, Golden Empres;, Cecil Wray, Duchess of Deronshire, Mrs. Harman-Payne, and Souvenir d'une petite amie. In the other cut bloom classes the chief prize-takers were Lord Brownlow (gr, Mr. Lowe). Mr. V. M. Martiv (gr., Mr. Wooster), Rev, H. J. H. Buhchelle-Herne (gr.. Mr. Fowler), Mr. J. Laficy (gr., Mr. Fortnum), Mr.
Blachwell (gr., Mr, Dinsmore), and Mr. Bosanquer.
The best cut blooms in Division III. Were exhibited by Mr. A. Rowlands, Mr. G. T. Skilbeck (gr., Mr. Roberts), Mr. F. Taylor (gr., Mr. Sharpe), and Mr. R. T. Prowse (gr., Mr. Bottom), the best Pompons being produced by Rev. H. F. H. Burchell-Herne. For Primulas, Mr. W.F.D. Schreiber (gr., Mr. Davis), and Rev. H. F. H. Burchell-Hernf. were
the leading exhibitors. The fruit winners were Mr. A, Rowthe leading exhibitors. The fruit winners were Mr. A. Row Lands, Mr. F. D. Thomas, and Rev. F. H. Hodgsor.
The best incurved and Jspanese cat b'ooms in Division II, not fewer than eighteen varieties, both came from Mr. C. E. Blackwell. Ths chief blooms exhibited in these classes were Chas. Divis, International, W. H. Lincoln, Col. W. B. were Chas. Divis, International, W. H. Lincoln, Col. W. B. India, John Lambert (2), Madame Darier, and Empresi of
Yor twelve Japanese blooms, Mr. R. Henty was ist; the
ame gentleman was successful in carrying off both premier sime gentleman was successful in carrying off both premier awards for twelve bunches of Pompons and twelve buaches of Anemone Pompons.

\section*{Table Plants, \&c.}

Mr. V. M. Martin captured both prizes for twelve table plants, pots not to ezceed 6 inches. Mr. S. T. Hollamd was declared the winnerfor six Primulas, whilst the 1.t prize for Primulas went to Mr. P. Bosanquat, Mr. R. F. Todeuntrer, and H. H. Glbbs, Esq., M.P.
For the sixth year in succession Messrs. Scrivener, whose exhibits were first-class in every detail, were the winners of the lst prizes for wreaths, croses, and bouquets. The bouquet of Orchids shown by them was a special feature of the show, and was greatly admired by the judges. The same firm also
obtained the special prize for a boaquet of Chysunthemums, which contained some vary choice dowers. Mr. W. B. Ketrle epecial awards for vegetables, with Mr. B. Hewty and Rev, F. H. Eodgsox as 2nd. Among the amatour cut-bloom winners were Mr. J. Fox. Mr. E. Mansfield, Mr. J. Day, and Mr. H. L. SELL.

The best cuttagar's exhibit of nix Chryanthemum blooms Mr. Shutler. was the winer, Mr. Chicd taliog 2nd; and Mr. ShUTLer was the winner of the mired bunch. Other wianers were G. W. Kevtise, E. Mansfielin, C. Chilis; while the special award for veretebles were obtained by W. Golding (two), W, Hall, J. Percival E. Towris.
T. J. Burdett, and G. W. Kentish T. J. Burdett, and G. W. Kentish

In the diviaion open to ladies, for aingle atand of out flowers and foliage, Miss K. MEAD was lat; and the same oompetitor Was also successful in carrying off two other lats for aprays of flowers and three button-hole bouquets of Violety, es well as 2nd for siz button-holes. Mise J. H. Smite and Mian M. D. Smith shared the other ladies' prizes.

\section*{Fruit.}

Grapes were shown well, the honours being equally divided between Mr. W. K. D'Arcy and Hod. A. Holland-Hilmert (gro, Mr. Cox). The open vegetable collection prizes were taken by H. H. Gibiss, Esid, M.P. (gr., Mr. Beckett), and Mr R. Henty (gr., Mr, Brown)

Messrs. Cutbuse's specials for 2 lb . of Mushrooms fell to Mr. S. T. Holland (gro, Mr. Bichardion) and Mr, H. H
Gibbs, M.P.

\section*{TORQUAY AND DISTRICT GARDENERS' ASSOCIATION.}

October 30.-The Torquay Horticultaral Society having ceased to exiat, the gap has been filled by the Gardeners' Association this year. It is gratifying to all concerned in the new venture to record that the ahow proved a most anccessfal one, notwithstanding the anfavoarable character of the summer and autumn. The collection of plants and cat bloome which constituted the show held on the above date was a very superior one, and reflected great credit on those who rained them.
There were ten competitive classes, and no fower than four of the lat prizes went to the Rev. Talbot Gheaves, whose box of six incurved varieties was greatly admired. Dr. W. FORD EDGELOW was awarded lst prizes in the clases for twelve and six Japanese varietieq, bssides gaining premier honours in large groups.
The Right Hon. W.
The Right Hon. W. H. Long. M, P., in addition to othor
prizes, was placed 1st for table decoratiams. prizes, was placed 1st for table decorationas.
A very fine collection of Eerns and foliane plante was sent by the committee of the Enith Houge Institution; and Mri. Rawson. Bramhope。
An interesting exhibit was the collection of vegetablew raised by the pupils of the Techaical Class for Gardening. Some of the eamples raised by acholars ten and eleven years of age caused expressions of wonder and surprise to appear on the faces of some of the older amateurs. The collection was faces of some of the older amateurs.
Messrs. Vextci \& Son, of Ereter, displayed fifty dishes of Apples, and a small but choice collection of Orchids. This firm also had on view some brilliantly-coloured Cannas, and a new Aster from Colorado.
Mr. W. B. Smale had a charming collection of Chryeanthemums, Ferns, and foliage plants, which presented a very pretty sight. Amoogst the newest varieties were Colonel Chase, a creamy-pink; John Machar and Wilfred Marshall. new yellows; Creole, the nearest approach to blue yet produced ; International, Comte F. Lurani, pink; Charles Davis, bronze; and Mrs. Ford Hillier, pritaroso. Messro. Cultiss, SANFORD \& Co., Limited, had a large exhibit consimting of Chrysanthemums and other plants, aud a large collection of fruit, amongst which were a number of fine examples of
Apples, the second crop of some trees at the South Devon Fruit Farm; Pears. Rapberries, Grapes, and a number of Fruit Farm: Pears. Rapberries, Grapes, and a number of
dishes of Apples. Mr. Smale contributed some charming bouquets and floral devices.
Mesars. Jarman \& Co. Chard, displayed a quantity of Onions, and dishes of Apples; Mp.W.J. Godfrer, bores of Carnations, including several very beautifully-tinted blooms of his own raising ; and Mesars. Tuplin, Newton; Beachey, Jenkir \& Co., Kingskerswell; H. Horn, St. Marychurch; and W. Allward, Torquay, staged miscellaneous collection, nection with the abow were adminably oarried oat by the nection

ROYAL AGRICULTURAL AND HOR TICULTURAL SOCIETY OF JERSEY.

Horticeltural Departerent.
}

Ocrober 30, 31.-The annual frait exhibitions held by this Society are worth a long jurney to nee, and that held on the above datet wan, if anything superior to any of previous year. The island hat long wince been famed for its Pears; and the oven quality of the grand collection shown on thit occamon proves that the island atill hold its own in that rempect. Apples have also wastly improved of late, but hardly an yet come up to the standard of large Eaglich show. The thow was held in the Society's

Pavilion, a bailding admirably adapted for the purpose; and the weather on the first day was fine.
Grapres headed the liet, but nomehow the Channel Islandere do not excel in this particular line. for the quality was not certainly anything like what is asually ecen at an averake Eaglish show. It being rather late io the menson for Black Hamburghs, there were but ewo exhilitiors, lat qoing to Mrs. Brayn (kr., Mr. Boubyer) ; and 2nd to Mr. A. Daviosom. The last-nawed exhibitor was alio lat with gool buaches of Gron with buth lacking in colour; and gong to Mr. J. Duphe, with amaller bunches. In the any other variety of bleck. Mr. Davinsos deservedly headed the lint with certainly the beat exhbie in the Grape classen, Vir.o. three buncher of that new Grape, Appley Towera The centre buach was perfect in colour and bloom, though rather umall ; the ind weat to Mr. H. BECK ER for Black Alicaster, samall both in banch and berry. but of good coloup. Muscat! were poor indeed. Bankets of Grapes were numerouly nhown, Mra, Baty winning lot for Black Eambarghe。Mr. Davinson and Mr. Brckir were equal let for any other black variety. the former with appley To and the latter with Alicante. Raskets of white cill for no spocial mention. Hakets el mixel Grapen, Mr. Brew ki. Mre. Braver, and Mr. Davingon, were 1ut, 2nd, and 3rd reapectively. APPSES were, prohably, for co'oar, size, and quality, the best ever before witnemed in the ikland. The splendid tunshine throughout the month of September had drabllem something to do with thin.
In collections of dessert Apples. sin varieties, Mr. H.
\(\mathbf{B E C K}\) wras facile princeps with Becker was facile princeps with Ribston, Coz's Orange, and King of Pippins (spleadid), Rosemary and Pile's Ruscets, and Cornish Gillifower. Mr. T. DE FAYe was 2nd, with
Reinette de Cauz, Golden Mejeetto. Ribston Pippin, Coupt of Wiok, Cornish Gills flower, and Hawmond't Seodliag. Colloctions of three varieties: Mr. BECKER was again to the fore, and Mr. E. G. MABETt 2nd.
In six culiaary varietien, Mr. T. de Faye wee lot, with aplendid samplea of Waraer's King. Waltham abbey Seedling, Striped Beefing, Beisette du Canada, Brabant, Belio Flear, and Blenheim Orange.
Mr. Brcker and Mpo E. G. MArett were equal list, the former with Calville 8t. Sauveur, Blenbeim Orange, Gloria Mundi, Golden Noble, Americsn Crab, and Relnette duCanada; and the latter with Bismarck, Lane's Prínce Albert. Holland bury, Emperor Alexander, Pearmaín, and Reínette du Canada. The above collec tions, both of demert and culionry sorts, were splendid, far above what is usually shown here.
In the clasess for single dishes, Ribston, Cos's Orange, and King of Pippins were represeated by specimens of unusual size and colour. Cornish Oilliflower was also of superior merit, (remarkably pretty), Golden Reinette, Wellington, Reinette du Cinada, Royal Ruaset, Hawthornden, Emperor Alexander, Alfritan, Glopia Mandi, Hotlandbary (Evad eolourf), Boinette de Cuzz, Warner'
Cox's Pomoan, Re.
Pears, as a rule at thome show, are a speciil feature There were no phenomenally large pecimen, as usually exhibited at these shown, bat aize and quality ruled throughout. For collections of deasert fraits, six varieties, Me. J. DiviarpORT was lat, with large and well-coloured specimens of Doyenné du Comice, Darondeau, Chammintel, Glou Mforcean, Duchesve d'sugoulếne, and Beurré Diel; Mr. De FAyE wal 2nd, with equally large and shapely frait, though not wo highly coloured, of Marie Louise, Doyenné du Comice, Máéshal de la Cour, Duchesse d'Angoule ze. Beupré Bachelier, and Chaumzatel ; equal 3rde weat to Mr. T. A. Neth and Mr. Beckels.
In the class for three varieties, the lst and \(2 a d\) in above changed places; equal 2 ad and 3 r 1 going to Mro Olenex and Mr brak far respectively.
For collections of culinary Pears, three varietien, Mr. Becker wal 1st, with Belle de Jersey, Lieutenant Poitoin, and Catillac: 20d, Mp. DE FiYE, with Beurré Chaigeau, Belle de Vire, and General Todleben
For twenty-five Chaumontels, let, gosd nize aud fnir calour, Mr. DAVEEPORT: 2nd, Mr. C. TALLIS, eomewhat smaller than the ist: 3rd, Colonel TuRWER.
Me. J. Duprif won the lat in the clscs for twelve Chaumontels; with Mr. D:iverpobt 20d, and Mesars. L. F. Le Masurier and Glenes equal 3rda. For five Chanmontela, Mr. DAVEAPORT was akain to the fore, with grand fevit; 2nd, Mr. L. P. Le. Masurier, better colour, but amaller.
The class for twenty-five Glou Morceaux was a tipe one, os aleo were the classes for twelve and fire. Mesaris. T. A. Neil. Davenport, TALLIS, and ASHELFORD, were the prizo-winners. Doyenné du Comice is becoming immensely popular, and threatens to supersede some of the older worta; Mr. NinIL y ith prise twenty-five were grand in sixe, hape, and ezguisitely,
coloured, and the clasees for twelve aud five were also apleadid. and the competition was clove iodee1. Mr. J. Covtamerse's (gr., Mr. Lane) twelve and fre Belle de Jerser were marvels of superior culture, very large, perfoct in chape, and the colour exoellent, theme eaily erored itt in each clas. Catillee, though fiow, were not \(s 0\) large mometimet sean, but MP.J. W. TheLla

The clases for single dishes were hoty contested, the ontrie being numerous, and the quality ever, made it no anecure for the judges. The following varieties were represented by large and beautiful fruit, viz., Duchesse d'Angoula ne, Pitmaston Duchess, Van Mona, Genl. Todleben, Beurré Bechelier, Durondeau, Marie Louise, Maréchal de la Cour, Beurré Diel, Bearré Superin, te. The beaviest Pear was a Belle de Jerseq, weighing 3 lo. There were two entries H, Brecer, F.B.H.S., of the St. Saviour's Nurearies, put up a
collection such as seldom zeen. The most popular Pears were exhibited in baskets, and there were some hundred or more exhishes of splendid coloured Pears, Apples, Peaches, Plums, \&o., together with a stand of three bunches of admirab!y-coloured together with a stand of three bunches of adm rackground of black Alicante Grapes, the whole having a bacgground of Palms and fine foliage plants, the tout ensemble having a splendid effect. Mr. Pb. Baileacie was 2nd with a collec-
tion of Apples only, amongat which were a number of local tion of Apples only, amongst which were
seedlinge, and varieties of inferior quality.

\section*{Chrisanthe iums.}

The Chrysanthemum Show was also beid at the same time and place. Groups were the principal feature, and the arrangement in most cases was very effective, especially in which fine foliage was allowed. Mr. Gr. HUQUET won in which fine foliage was allowed. Mr. G. LE H. L. DE FAYE, 2nd. In the class for groups with an edging of green foliage
plants only, Mr. LE HUQUET again won the special prize plants only, Mr. Le HUlQET again won the special prize
offered: with Mr. A. J. DE ST. Croix. 2nd; and Mr. A. J. Le QUESNE, 3rd. Trained plants were far behind what is usually seen here, but cat flowers were splendidly shown by Mr. N. Alisitis, who entered in almost every class of incurved, Japanese, and Pompons, with the result that he won the National Chrysanthemum Society's Silver Medal, and carried (if the bulk of the 1st prizes with splendid blooms.
Mr. GLENIN, of the Springtield Nurseries, was awarded 1st for a very tastefully arranged table decoration; and Bouvardias lor a very tastefully arranged table decoration; and Bore Mr. C. J. Nrcoule, and Mrs. Robin.

\section*{HIGHGATE AND DISTRICT CERYSANTHEMUM EXHIBITION.}

October 31 and November 1.-The exhibition held on the above dates was one of the best yet held by the Society, a keen competition reigning throughout. The entries and exhibitor were in exces of last year, whilst the blooms were charac terised by high finish, quality, and not merely by siza, points which the judges duly considered. An improvement might be made another year in the naming of the planta. The trained apecimena were placed on stages ; a long atake with the name inserted at top wan placed in each pot. We would auggest that, in future, boldly-written, correctly-spelt labels be used, and in the line of vision; this arrangement would much add to the convenience and information of those engaged in reportiog, and be of material assistance to that not small section of the public asiatance to that not masiliection af extend sach exbibitions for edactional parposes.
Groups of Chrysanthemums, arrangetin a spzce of 60 square feet, general effect, formed a leading feature, and in thisdivision
Mro. J. Brooks, gro to W. REYNOLD3, Esq., The Grove, was Mr. J. Brooks, gr. to W. Reynolds, Esq., The Grove, was
Ist, with a very finely.fiowered and well-arranged lot of plants. Mr. H. Eason, gr. to B. Noskes, Esq., made a good 2nd; whilst a very creditab!e arrangement secured the 3rd place to Mr. G. Saunders, gro to W. HAYE3, Ksq. Messrs. Broors and Easor gained the principal prizes in the classes for six trained plants-Pompons and large-flowering-with eramples of high cultural skill. For a single specimen plant (any class). Mr. Brooks gained premier honours with a finely-flowered example of Maiden's Blush.
A good and interesting class was that for three untrained plants (Pompons). Here the leading prizes were taken by Mesirs. J. Wricirlt and T. Jackson.
Cut blooms, twenty-four Japanese, not fower than eighteen parietics.-Some fine flowers were shown in this section, and Mr. J. Barch, gr. to J. Smith, Esq., The Priory, Mill Hill, was adjudged the winner of the lst prize. Some of his principal Howers were J. Shrimpton, C. B. Smith, W. Tricker, and Alfred Marehall ; a close 2nd was Mr. Rowbottom, gr. to H. R. Wrinime, Req. Here were noted good blooms of Viviand Morel, Phoebus, Sunflower, and Eda Prass.
Thirty-six cut bloomp, distinct, e'ghteen Incu ved and eighteen Japanese.-A very fine class. 1st. Mr. W. J. Burca, O. H. Payne, Etoilede Lyon, Van der Heede, Phoebus, Viviand Morel, and Madame Isaac \({ }^{\prime}\); incurved. Violet Tom'in, Queen of England. Baron Hirsch, and Annie Hoste. A capital lot of flowers gained the 2nd position for Mr, Rowbotrom.
Twelve Japares".-1st, Mr. A. Page, gr, to A. Taylor, Esq. Priory House, his noteworthy flowers being Princess May, Sunflower. C. Shrimpton, and Colonel W. B. Smith ; 2nd, Mr. S. I. Cook, gr. to J. H. Hartridese, Esq, who had, amongst others, fine blooms of Avalanche and Mrs. H. Payne. Six Japanese.-1st, Mr. C. H. Martin, gr. to Mrs. F. C. R. Lavgrry, and whose stand contained some fine blomsm of Colonel W. B. Smith and W. H. Lincoln; 2nd, Mr. A. PaGE, Avalarche in this lot being very fine.
Nix White Jap: nese.-1st, Mr. H. A. Page, gr. to F. Crisp, Req. ; here were beawtiful blooms of Madame Capnot, Madame Therìse Rey, and Rose Wynne. 2nd, Mr. J. Brooks, gr. to W. J. NswMAN, Req.. who, amonget other fine flowers, had a Very fine bloom of Madsme A. Moullin.
Six Japanese (white exciuted).-1st, Mr. E. Rowbotrom, With Colonel W. B. Juith; 2od, Mr. W. J. Burcr, who had
sunflowes. Sunflowes.
Twelve Incuroed and Twelve Japanese.-An attractive c!ass, in which the first honours were gained by Mr. H. A. PAAE, Amongrot incurved, he had fine flowers of Mrs. Heale, Madame

A good 2nd was Mr. Rowbottous, some of whose best flowers amongst the incarved varieties were Queen Cf Eagland, Golden Empress, and Lord Alcester ; Japanese, Sunflower, and Utop'a.
Thisty-six Pomrons, twelve varteties, in threes. - A brautiful and interesting class, in which some fine blooms were staged. 1st, Mr. F. Marthews, blooms were Adonis, White Mıdame Martha, and Wm. We stlake. 2nd, a fine lot from Mr. S. J. Cook; here Were good flowers, amongst others, o! Sueur Mélanie, and President.

Twelve Anemsn es. - Another good class. 13t, Mr. A. Jones, gr. to Miss WYBURN, Barnet, the W. W. Astor and Gladys
Spzulding being specially noticeable; 2nd, Mr. J. SANDForD. Spzulding being specially noticeable; 2 nd, Mr. J. SANDFORD. blo mos gained 1st honours to Mr. J. H. Walker, Gold Beaters, Mill Hill; Alfred Lyne, Jeanne d'Arc, and Brookleigh Gem were shown well. \(2 \mathrm{ni}, \mathrm{Mr}, \mathrm{H}, \mathrm{A}\). PAGE, whose best flowers
were Je une d'Arc and Novelty. (Incurv d).-let, Mr. J. H. Waliker, with a fine bloom of Baron Hirsch; 2nd,
Page, who showed Madame Darier extremely well.

\section*{Miscellaneous.}

A pretty and attractive class was that for a hand basket of tut blooma, arranged with Ferns, grasses, and foliage, the principal prize-takers being Messrs. WARD and RowbotroM. Button-hole bouquets of Chrysanthemums, arraged with Ferns, grasses, \&c., bronght out some elegant compositions,
the leadirg positions being taken by Messrs. Parkins and For a dinner-table decoration of Chrysanthemuma, \&c., an effective class, the principal prize-winners were Messrs. for twelve blooms with foliage, aud exhibited without cups or artificial dressing, the prizes being taken by Messrs. Brooks and Walker. Some boldly-arranged and very pretty exhibits were staged in response to the prizes offered for two vases of Japanese Chrysanthemums, arranged with any decorative eff:ct. 1st, Mr. J. Brooks,
Botrom. Table plants, principally well-coloured Crotons, вотTom. Table plants, principally well-coloured Crotons,
were well displayed by Messrs. EAs N , HAYLEs, and Tubbs. Mese wro. B. S. WILIIAMs \& Son, Upper Holloway, sent a sautifully freely-flowered group of Chrysanthemums, not for competition, contributing also some fine Palms for the decoration of the hall in which the exhbition was held.
Messrs. M. Hunt \& Son, Highgate, seat a very fine moncompetitive collection of fruit. Mesers. D. \& W. Buchavan, Stirling, also sent-not for competition-an excellent exhibit of Grapes, Tomatos, and very large coloured Vine-leaves of Grapes, Tomatos,
artistically displayed.
Tomato3, here of fine quality, were shown by Mr. S. J. Cook and Mr. H. A. PAGE. Black Hamburgh and Muscat Grapes by Mr. J. Tubbs, gro, to H. RIGNAUT, Esqo, and Mr. J. dessert and kitchea Apples were well shown by Messra. Savdford, Tubbs, and Waiker.
The show was well-managed by Mr. W. E. Boyce, the Hon. Secretary of the Society.

\section*{THE CRYSTALPALACE CHRYSANTHEMUM.}

November 2. -The annual exhibition of Chry"anthemams, held on the above date under the auspices of the Crystal Palace Co, was a very uccensful one, and quite diapelled any feara that may have existed that exhibited blooms, at any rate, will be poor this season. If the exhibits generally had been at all equal in quality to ome of the first-priza collections, the exhibition would have been one of the fineat ever held in the Palace.
In the first class, for example, that for thirty-sir Japanese blooms, in not fewer than twenty-four varieties, the blooms staged by Mr. W. H. Lees, gr. to F. A. Bevañ, Esq., Trent Park, New Barnet, were superb in quality. Nor did the varisties used ahow any lack of selection. of yellows we noticed Phoobas, H. L. Sunderbruch, M. Panckoucke, Thos. Wilkins, Sunflower, and Pallanza. The last-named was in the back row, Sunflower in the front. Of whites there were Mre. W. H. Lees, Mutual Friend, Mdlle. Thérèse Rey, and Madame Carnot. International was shown very fine, and exhibited the characteristic ro39 marling in the petals, which exhibited the characteristic ro3e marking in the petals, which one at the same time. Then there were Madame Ad. Moulin, E. Molyneux, Chas. Shrimptos, G. W. Childs, M Geo. Biron, Miss Dorothy Shea, CJI. Smith, Mons. C. Molin, Chas. Davies, and Viviand Morel. Next came the collection from Mr. J. W. McHattle, gr. to His Grace the Duke of Wellimaton, Strathfieldsaye. Mortimer, whose excellent blooms would have made a good 1st in the absence of Mr. Lee's stand. Among new ones, Mr. Mchattie included, were Madame Carnot, Duchess of Wellington, Mephisto, M. Chas. Molin, Pallanza, W. H. Lincoln, and M. Geo. Biron ; the 3rd prize was taken by Mr. C. J. Salter, gr. to T. B. Haxwood, Esq., Woodhatoh, Reigate, and there were three or more other collections. The claes for twenty-four incurved flowera, in not fewer than eighteen varietien, also fell easily to Mr. W. H. Lees, his blooms were of excellent build and colour, and being good at this early show, the promise for fine incurved blooms is a good one. Two fine blooms of Chas. H. Curtis were very effective and pretty, and Jearne d'Arc, Lord Alcester, Empress and Golden Empress of India, the new Globe d'Or, Mise M. A. Haggas, Lord Wolsoley, Priceess of Wales, Violet Tomlin,

Madame Dirier, Jno. Salter, \&c., were all good; Me. J Dumble, gro to Sir C. Phillips, Bt., Picton Castle, Havesford west, was 2nd ; and Mr. C. J. Saliter, 3rd.
The prize for eighteen incurved, distin st, was won by \(\mathrm{Mr}, ~ I\) Robinson, gr. to W. Lawrence, Esq, J.P., Elsfield Hoom Hollingbourne, Kent. Of new varieties, D. B. Crane, ot gold-coloured, rather small compact bloom, was ineluided but the quality in this cass was of less merit than in the preceding one. Mr, Jıp. Wyatt, gr. to J. Perbry, Ksq., Bradenhurst, Caterham Vallyy, was 2nd ; and Mr. T. Cargef, pr. to A. G. Hubbuck, Esq.. Weybridge, 3rd.
The qua'ity of the blooms entered in the clas3 for twadre C. Buss, Esq, Lodge He rairly Ashford, Kent, was leter, gro to included no novelties, and his best blomms were Jeanne dus and Brookleigh Gem. Mr. A. Start, gr, to Lo Compr, Ar Round Oak, Englefield Green; and Mr. W. Cullins, ge, to Round Oak, Englefield Green ; and Mr. We. Clllins, ge to
J. W. Carlite, Eicl., Ponsbourne Park, Hertord, ware had and 3rd respectively
The best incurvel variety in six blooms was Baron Hirch, shown by Mr. Butceer; and Mr. Jas. Wyatr, wifl tho same variety, was 2nd.
The class for eighteen bloom3 of Japanese, distinet, hhs Cor, gr. to J. Troțer, Esq., Brickendon Grange, Hertiond was lst, and he includel the following new ones:-Intan national, Commandant Blusset, M.ss Ethel Addison, Tho Wilkins, Louise, H. L. Sunderbrach, and a seedling, a harge flower, with broad fiorets recurving at tip, yellow, with muls of rose, rather rough as shown; 2nd, Mr. W. Coluless; and \({ }_{3} \mathrm{rd}\), Mro A. Jones, gr. to Miss WYBuRN, Hadleg Manor, Barnet.
Twelve Japanese blooms, distinct, were beet from M. A. Smith, gr. to R. W. Inctiss, Esq., Craigcudowie, Reigate Hill. He had Ethel Addison, E. G. Hill, Sunflower, and Col Smith, very good. Mr. H. Butcher was 2nd, and Mr. I Budworth, gi. to E. Hill, Esq., Rockhurst, West Hoathly, Sussex, 3 d

Viviand Morel was the best Japanese exbibited in the chan for six blooms, ani they ware shown by Mr. W. Robinsm, gto to Lord Justice Lopes, Heywood, Westbury. He had foor excellent blooms, the other two being unequal; Mr. C.Cos followed with CJI. W. B. Smith, in fine form ; and Mr. G. SMITH with E. Molyneux was 3rd.
In the class for eigateen reflered and Japanese reflezel blooms, distinct, the exhibitors were disqualified for inclutiog bloons' in the opinion of the judges, which were not reflesed. Extra prizes however, were a warded to Me. C.J.SALTER, Mr. R. C. Notcut, Broughton Road Nurseries, Ipswich, and to Mr. W. Robivgon. This is a clags which, as at present arranged, may at any time result in dissatisfaction.
The be.t eighteen Anemone and Japanese Anemone blooms (distinct) were shown by Mr. H. Prickett, gr. to J. M. Hanriki Esq., Bohm Lodge, East Barnet, and the quality of his colleption was admirable, M. Dupanloup, Jno. Bunyan, W. W. Astorn Sir Walter Raleigh, and Dame Blanche, were noticeable. X, J. Milner, gr. to Mrs. W. A. Higas, Willenhall Park, Barnem, Rei Mr. G. Steer, gr
Reigate, for 2nd place.
In the class for tweive Pumpons, three blooms of each, iise tinct. Mr. C. J. Salter was a very easy 1st, and shomed admirably, and he also won the chass for tweive M. Yasars and Mr. J. Krapp.
Mr. J. Milner, gr. to Mrs. W. A. Higas, Willenhall Puk, Barnet, won for twelve Japanese Anemone blooms, am the new Descartes, together with W. W. Astor and Bodoph Ragionieri were eapecially fine; 2nd, Mr. HY. Prictrrif Ragionieri were especially fine; 2nd, Mr. Barto, The Xuh 3rd, Mr. J. Justice, gr, to
Kempsey, Worceeter:hire.
Class 1 is was an exceedingly pretty one, being arranged t the neglected single varieties. Mr. W. Wells, Earlswer Nurseries, Redhill, was lst, and he had some very atrachan flowers indeed; Mr. W.C. Pagram, gro to J. Courtersx, \({ }^{\text {K }}\), The Whim, Weybridge, was 2nd.

\section*{Groups and Plants.}

There was little competition in the classes for groupp arragged for effect and in those for trained plants. The best group of 100 feet square was put up by Mr. Wher. but its arrangement was not of exceptional charactor. dmad plants, helped largely in the effect.
The smaller group (Amateur), upon 50 square foet, was mon The smaller group (Amateur), upon 50 square Bunfied Boerd by Mr. W. Webster, gr. to W. Higas commendablo.
One of the most important group classes was that for group of Japanese varieties (Amateur), arranged on an on. space, with foliage plants, both coloured and grem common Howe, gr. to H. Tate, Esq., Park Hill, Streatina col by very well carried out this idea; and he was foll Villa, Uppet T. W. Wilkins, gr. to C. Ralph, Eeq., Cranbrook BIRD, Bq9. Norwood; and Mr. Chas. Turne Manor House, West Wickham.
The best-trained specimen plant of Chryeanthemum ms W. H. Linculn, shown by Mr. W. Leake, gr. to J. M. Dovg he
 best dozen trained specimens were fro
nurseryman, Ayjenham Road, Croydon. The best arrangement of cut blooms of Carryan Pal Peroen

\section*{Miscellaneoug.}
 anthemums, including a singlo-flowered one den gellow dik a fairly large many petalled bloom with goldea goll
and paler yollow ring round eamo, the remaining part being cloeely spotted red; Looarno, a large golden yellow coloured Japanese, and others were very good. Mrs, Brisooe-Ironside is a pretty incurved Japanese bloom of attractive fleih colour. All the blooms were thown on the exhibitors' revolving circular flower stand.
Messrs. D. \& W. Buchamav, Kippen, mear stirling, exbibited naturally-coloured Vine leaves, and foe Grapes and Tomatos. Mr. R. C. Notčt had blooms of a good yellow Japaneeo Chrysanthemum named Edith Tabor; and Mies Mary Jackson, Upper Norwood, had florist's arrangemente. Mr. T. S. W \(\triangle\) RE, Hale Farm Nurseriea, near Tottenham, had Clarga group of plants representing decorative varietiea of Chryeanthemums; and Measrs. Jwo. Laing EONs, Forest Hill, London, S.E.. had a miscellaneous group of ornamental foliage and flowering plants.

\section*{BRIGETON AND SUESEX.}

November 5, 6.-The thirteenth annual exbibitton of this Society was held in the Dome and Corn Exchange on the above daten. Conaidering the great competition caused by other ahown, there wat room for congratulation upon the quality and the number of the exhibita. A new deparcure was made in the groups, and inttead of being semi-circular, as before, they were arranged in circles running ap the centre of the Corn Exchange. This kind of arrangement calls for more skill in placing the plante, and met with general approval from the viaitors.

\section*{Plants and Groupg.}

Mr. G. Miles, Victoria Narfery, Dyke Hoad, Brightoa, was 1st for the largest group; and he was followed by Mr. H. Head, The Drive Nursery, Brighton; bat all of the larger groupe were too densely put together as regarded their contents, and not so pettily arranged as the lat prize groap in a class of which the condition was that it must not exceed 9 feet io diameter. Here Mr. J. Thorpe, 20, Weat Hill Rond, Brighton, staged a very pretty lot.
For twelve planta, includiog Ferns and other greonery added for effect, Mr. G. Miles was again placed litt; Mr. J. Turser, gr. to Sir Greville Smytirs, Wiok Hall. Hove, Ind, whove group showed botter arrangemest, but the planta were of inferior quality.

\section*{Plants.}

Mr. E. Mebceien was let for four standards, Mr. T. Fairs lst for four pyramidal, and Mr. J. Bills lat for four dwarf plants. The last-named exbibitor was a good 2nd in both of the previousclasses. Table planta, Cyclamens, and Solannms were good, but not 80 numerous as usal.

\section*{Cut Flowith.}

It a olass for thirty-six Japanese, a Challenge Silver Cup and \&5 for the premier prize, broughtjout a good number of competitors, and the Cap went finally to Mr. Standiw, whose flower: were magnificent. Among the best were E. Molyneur, C. Devis, Sunflower, and Miss D. Shea; Mr. J. Hart, gr. to H. Head, Eeq, Shoreham, 2nd; and Mr. A. Shaughter. Steyning, 3rd. Mr. M. Standiog, gr. to Mri. Joıd, Patching, near Worthing. also came well to the front in a clase for twenty-four Japanese; Mr. M. Tourle, gr. to F. Barchard, Esq., Little Horeted, beigg 2ad in thif case. Mr. J. R. Heasman, gr, to Mrb, Oxter, Fen Place, Turner": Eill, beet Mr. £fardixG for twelve Fen Place, Turner
incurved varieties.

A class for twe?ve Japanese varieties brought out a very close and keen competition. Mr. G. Duncan, gr, to C. T. Lucas, Rsq., Warnham Court, Horsham, was l‘t; he being followed by Mr. C. Sayers, gr, to the Misoes Coor, Natley, Uckfeld. Equal 1sts would here not have been out of place.

\section*{Fruit.}

For three buaches of white Graper, Mr. G. Duscar beat Mr. W. Taylon, his berries being batter finished. Mr. W. Taylor, gr. to C. Bayer, Esq., Tewkeabury Lodge, Forest Hill, was Er.
well in front sor three bunches of a black varioty. The well in front or three bunches of a black variety. The competition for four dishes of deseert Pears was strong, Mr. Goldsmite, winning from Mr. HessMan here; but in an
equally strong class for four dishes of desert Apples, Mr. A. equally strong class for four dishes of desert Apples, Mr. A.
Kemp, gr. to C. K. Scrase Dickens, Eeq., Coolhurst. Horsham, was in front of Mr. GOLDsMII H , who was again let for four dishes of culinary varicties.

Vegetables
Were up to the usual good quality, but they were not quite so plentiful as beretofore. The chief stands-not for competi-tion-were Mesors. W. Balohis \& Sons, Brighton and Hassocks; and Mesars.J. Cheal Sons, Crawley, who had in both instances some grand dishes of Apples and Peary.

\section*{ENQUIRY.}
" He that questioneth mweh shall liarn much." -Bicon.
Cokr v. Anthractite Coal.-Will any of your reader kindly inform "N. F. P." the relative cont of coke and anthracite conl, say, for three, aix, or twelve months (the latter preferred)? An opinion from One who hat kept an accurate account of the cost in esch is alone denired. The nfe of sabes, de., would vitiate the comparison.

The Weather.

\section*{THIR PABT WEEE}

TIIE following aummary record of the weather throughont the Britiah Islande for the wesk ending November 2, fs furniehed from the Meteorological Office:-
"The weather was very changeable during the earlier part of this period, with frequent showers of rain, hail, or sleet in all districts, and occasional thunder and lightning at some of the south-western and southern etations. Towards the end of the week, bowever, a decided improvement took place, fair dry weather being experiesced generally.
"The temperature was again much below the mean, the deficit ranging from \(5^{\circ}\) in Ireland and the Chmanel Islands, \(106^{\circ}\) or \(7^{\circ}\) over Great Britain. The bigbent of the maxima were recorded either on Novembar 1 of 2, and ranged from \(18^{\circ}\) in 'Eugland, S.W.,' and \(57^{\circ}\) in "England, E, and \(8 .\), ' to \(49^{\circ}\) in 'Scotlond, N.' The lowest of the minima were registered 'Scotind, N. Tho lowest of the minims were registerrd in the 'Midland Counties and England, N.W..' to \(2 j^{\circ}\) in - England, S. W."' \(21^{\circ}\) in 'England, S. and Scotland, E. and W., and to between \(22^{\circ}\) and \(25^{\circ}\) in all other districts excepting the 'Channel Islands,' where the lowest reading was \(34^{\circ}\) The lowest values reported from thermometera exposed on the grasy where \(13^{\circ}\) at Worknop, \(16^{\circ}\) at Loughborough, \(20^{\circ}\) at Oxford, and \(21^{\circ}\) at Stamford and in London.
"The rainfa'l exceeded the mean in the "Channel Islands, and just equalled it in 'Ergland, S.,' but was rather lens than the normal in nearly \(l l\) the other districte, and considepably so the normal in nearly all the 'Midland Counties.'
"The bright sooshime varied considerably in amount orer different parts of the Kingdom, but exceeded the normal in most districts. The percentage of the possible duration ranged from 44 in the 'Channel Islands,' 22 in 'Ireland, K ., ' to 24 in 'Scotland, N., snd 13 in ' Evgland, N.W.'

Potatos.
The trade during the patt week has bres quiet, and pricen aot wo firm in and stack at the depat hare alightig inerneel. J. E. Themas.

- Oroing to the large increase in owr oirculation, we are contributors voiul kinully aid us by sendime their communtoation contributors wiul kindly aid us by sending their communtoation net later than Wednesdast.
Boors: T. B. We knuw of mo botk treating of tove planta only. Other questiun mext week.
Bulbs: E.J. The condition is the reenlt of some injury to the base of the balbt by wire-worm, or some other caase.
Clmmatis Graftina: Rora. C. Aammala, \(C\). vitalbe, or any trong growing pecies of which eeedling can be raised. Graftiog on the roota is done in February and March in gentle bottomheat in a close house or in a frame within a warm house.
Dwary Kidney Beaks: Mignon. These are never grown in this country in cool greenbouse in the winter sesson, nor could they be so grown. The plant needs a minimnm warmth of \(60^{\circ}\) and the day temperature ahould not be less than \(70^{\circ}\) in bright, or \(60^{\circ}\) in sunless, westber. Good varioties are \(8 y 00\) Housp, which dues with little atcention; Negro Longpodded, Ne Plus Uitra, and for large pote and where space is of no account, Canadian Woader (Red-seeded Flageolet).
Frut Storina: Hopefuh. The book dealing with thin matter were both right and wrong in their teaching. As a mattr of fact, a fruit-room can sarcely be too cold, whort of lettiog the front aet in, st no fruit should be allowed to get frozen. To keep the frait-room "air-tight" from the first is not the right prectice, the fraite on being gathered parting with a good deal of their moisture, and means for the excape of thi must be adopted, or the excentive smount of moistare in a close place would certainly cause great low from decay being net up. Therefore, keep the windows open
night and day，unleas during very damp or foggy weather．After the lapae of a month or five weeks from the time of patting the balk of the fruit into atore，the amount of ventilation should be lessened by degreea，the frait being examined from time to time to atcartain if there in any moisture being still deposiced in any quantity on it，and if there if， then a moderate amount of air mast continae to bs admitced．In the third week in November， the room may be closed，and daglight quite ex－ cluded．It will be necessary to afford air orcasionally after that date，if the quantity of fruit in the atore is a large one，and the door and windown fit closely．It is a good plan to have a few ventilating clappers in the roof or upper part of the walls，for the purpose of letting oat the moisture after this dace．Very hard，late－ keeping varieties of Apples and Pears may be kept in boxes and large plant－poty，or barrels，but the choicer or softer－fleshed varieties keep beat when pread thinly on the shelves with nothing between them and the wood．Never use atraw，hay，or brown－paper on the shelves． When cider frait is laid in heaps out－of－doors and in barns，atraw is sometimes thrown over them as s protection against froat，and also spresd on the ground so as to keep the fruit clean；but in the fruit－room nothing of the kind is required．Straw． hay，and brown－paper，if they are dry at the firat， moon become moist，and in this state they are readily infeated by mould which may attack the frait，and the first two certainly impart mastiness to it．
Gros Guileatme Vine as a Stock for Doke of Buccleuch in an Early Vineri：F．S．Not as a general rule（except experimentally）advisable，an it would affect the early ripening of the Graper， but not much．If you think it deairable，as afford－ ing a longer anccesaion of Grapes from the early Vines，it might be worth doing．The atock，if of a black variety，alightly affect the colour of a white one worked upon it，and sometimes the flavour，which may be a good or a bad influence according to variety．The form of the bunch may aluo be affected somewhat，as well an the keeping qualitien of the Grapen；early varietie that may not be good keepers when growing on their own roots，haviog a longer season of use when grafted on long－keeping varieties．We may，therefore，infer that there is a slight thickening of the kin，or a greater proportion of tannin is present in the latter．The anbject is full of interest，and requires working out fully．
Insects：W．C．The caterpillar is that of the common Cabbage Moth（Mamestra brasnice）；it will feed on almost anything．Try an application of soot or gas－lime close to the stems of the plants．R．McL．－ Insects on Grapres：\(G\) ．W．Hunt．In one of the Grapes wa found the pupa of a small two－winged fly，imposaible to say of what apeciew．It may be that the berries are attacked by womething else in the first instance，and that the flies are attracted by the exuding juice．The berries were mach crashed，so that examination was difficult；a few gruba separately in a small brass or glan tabe would etand a better chance．R．McL．
Marikt Flowers：A．B．Carnations，Pgrethrame， Gladiolus，Schizontylis coccinea，herbaceous Paonien，Crocas，Snowdrops，Scillan，Narciasas， Talips，Roses，Lilies，enpecially longiformm，japoni－ cum，elegans，candiduc，and auream；Lily of the Valley，Solomon＇Seal，the beat varieties of Michselmas Dainies，and many more．
－Plavis，Fruits，NTG，To we Navied．－The appll－ cations to name flowers，and especially fruit，are so numerous an expenditure of tume，labour，and money，if which our roaders can have no idea．We are always willing to oblige our correspondents cas jar as we cxs．but the editing of the \(G\) urdeners＇ Chronicls is our business，to which everything else must guve way． Correspondents are respsetfully requested to observe the rule
that not more than six spectmens cas be dealt with at a time． that not more than six spectmens cas be dealt with at a time． senaer，to send also a mall contribu：ion to the Gardeners＇ Orphar Frond．Specimens should be good ones，carrefuly packed and numbered．Leavis only，of Floristi narieties cannot，as a ruls．be named．Correspondents sending plants or froits to be named，or asking questione demanding tive and researeh for heir solution，must not espect to obtain an anewer to their Naxes of Frulis：W

Names of Plants：Correspondents not answered in this issue are requested to consult the next number．－ P．H．1，Rhamnus catharticus；2，Pranus lasi－ tanica，var．azorica．E．J．，Botley．Cratzgus Crus－galli，var．pyracanthifolia．－J．W．Commos bipinnatus．－J．W．B．1，Crucianella atplosa；2， Avacyclus tomentosus；3，Scutellaria altisaima； 4，we do not recognise，mend again when in flower．
 picta；2，Cypripedium venuatum；3，Iresine Herbatii ；4，Sedam Sieboldii ；5，Festuca ovina．－ R．J．G．A Golden Rod，perhaps Solidago cana－ densis．Our wild S．virga－aures is sometimes called Aaron＇s Rod．－P．H．1，Picea；2，perhapa Abies Nordmanniana；3，Abies；4，Paendotsaga Douglasi；5，Larix；6，Picea Menziesii；7，Abiea nobilis；8，Picea；9，Abies Webbiana；10，Abies nobilis；11，Taxodiam diaticham．It is mere guess work naming Conifers without the conew． You send more than six．－J．B．S．A，Lastrea lepida； 2 ，Nephrodium molle corymbiferum．－ Hortis．The Orchid you mention are remarkably fine．C．is Oncidiam pratextum，not O．crispum． E．Lelia cinnabarina．The Primula obconica does not appear to be remarkable．－H．F．sends Oncidium pretextum and Cattleya lateola．－W．M． Cattleya labiata，antumn－flowering variety，a plant now tolerably plentiful in gardens－Nortaleigh．1， Stapelia Bufonis，Bot．Mag．，1676；2，Callicarpa purparea；3．Corydalis latea．
Orchid Cultura：S．\(H\) ．All the pecies you men－ tion may be grown in the cool－house all the year， but they might be benefited by a elightly higher temperature while growing．Deadrobiams of the D．densiforam section as enumerated，often flower on the imported pseado－balbs．They should be kept cool and tolerably dry during the winter．In some gardens a position in one of the frait－houses is found to anit them．D．Findlayanam should be reated like D．Wardianum，after the growthe are fully made np．You might get Burberry＇s Amateurs＇ Orchid－Cultivator＇s Guide．
Pteris：Fern．It is not divesve which causen the brown markings on the Pteris sent．It is known to growers of these plant for market that a certain strain，which was originally named Pteris cretica magnifica，invariably get affected in that manner in autumn and winter．It does not atand cold or damp，at do the other varieties．Growers can pick it out by the hard feel of the fronda，and the prominence of the veining ranning from the mid－rib．It in better to get sporen of another atrain．
Rrododendrok Leayns Bitten ofe the Pcants： W．L．The work of mice or weevile，probably： wo cannot say with certainty．Set mouse－trapm． Examine the window－boxen at night for the weevils．The latter are active little beetles， bolting at the merest glimpse of a light．
Rose Buseses：Rosa．The bushes may be thinned of their aboots at this aeason or at the proper praning
time，March．It is advieable not to prane at thin aeason，for should the winter be a mild one，man of the buda would atart to grow very early in th spring，and there is alwaya a riak that these will b nipped by apring froste．
Rose Grafting：Rosa．At the end of the month of Docember and early in January，on potted atocks gradually forced into growth．The temperater should not exceed \(60^{\circ}\) by day or \(50^{\circ}\) by night．
Strelitzia augusta：Munches．We whould think that if you do not re－tub the plant for a jear on two，bat merely surface the ball after removim some of the old soil，keep the drainage right，ad give the plant a good rest in the cooler part of the atove，reducing the quantity of water at the root it that time it will show flowerm．The plants should not be afforded much heat，as the temperatare of in intermediate－house arits them in the winter and in summer，in warm farts of the country，they will do well out－of－door，or in the greenhoura bat with you it will be better to keep them almys under glas．Loose potting leads to atrong gronith and is therefore ananited for the plant what mat be grown in hoase of the asual aizs．
Tea Rose Stocks：Rosa．Seedling Dog－rone（Bon canina），or plante taken out of hedgerom，de The true Rose polyantha is aid to make an ar cellent atock．Tea Rose need no apecial kind of stock．Some of the strong growers are better on their own roots，and in all casea the union of stod and Rose ahould be under－ground，otherwite vary severe frosts might dentroy the entire badded put of the plant．
Traasteen Apple：Hibernia．There is no Dauia Apple named Trassteen，but the Danith nama of the German Apple Gravenstein is Graaten．Pro bably，the＂\(G\)＂in some way has been exchaggel for a＂T．＂Some varieties of Gravenatein are o of a comparatively new date，and all of them an very fine，at least when grown in our norther climate．\(N\) ．
Tomatos，Fruit，ano Vegetablef：J．Gruigen Your communication hat not been received．
Water lilies in an Open Pond：R．W．\(A_{1}\) Johannesherg．Nympbæz corrulea（stellata）havigy aucceeded，hows that the nature of the wiver not at fanlt；but Nelambiam specionam require to have the needs nowed in flower－potii warm water nader glam，and the plants pat in the pond after the water in the latter hat becon warmed by man－heat．This may be doas placing the pot and plans intact into a buk filled with rich loamy soil，and sinking it to ti bottom of the pond．The soil in the basket woul be covered with atones， 10 ess to keep bue will it place．Some of the more tender specia Water Lily sacceed only near the margias lake where the water is warm，refuning to gron all in deep water，in that which is diatant fom the bank．Mesara．Siebrectit \＆o Wadiey， 40,1 ， Avenue，New York，would be enabled to the the required aeeds．
Whers to take Shoots of Hardy Puyts rie Grafting：Rosa．In mid－winter，laying that siagly in the earch to two－thirds of their lenght in a cold place，so an to retard all nap movereatil the latent date．

\section*{CHRYSANTHEMUMS．}

\section*{all growers who desire the best varieties only W．J．GODFREY＇S CATALOCUE．}

It is the MOST RELIABLE LIST published．（Ready early in December）．
Before the blooming season hardly began，Catalogues for 1896 were distributed containing long lists of Foreign Novelties，with descriptions appended，as supplied by the various raisers．Not a tenth part of these had bloomed in this country，and not one in twenty will be worth catalogaing another season．Those growers who are tempted into trying them will be sorely disappointed．

W．J．G．has on trial of this season＇s Novelties 220 varieties from Continental raisers， 76 from America and Japan，all the English introductions，and several hundred second－year seedlings of his own raising．ONLY THE VERY BEST of these will be catalogued，and no expense and trouble are being spared to sift the few＂grains from the chaff．＂Strong，healthy，country－grown outtings can be supplied at once，if desired，and at same prices as offered by other responsible firms．

CODFREY＇S NOVELTIES FOR 1896 will consist of really sterling varietiee，every one of which has

\section*{WHAT HAS RECENT CHRYSANTHEMUM SHOWS PROVED？}

\title{
WHY THAT THE XL ALL LIQUID MANURE
}

\section*{Is a Great Assistance to the Prize Winner．}

Mr．W．H．LEES of Trent Park Gardens，New Barnet，was the first to take this Manure in hand．He has used it freely，and his unparalleled success，both last year and this year，at the most important shows，tells its own tale，and this oannot be too widely known amongat all lovers of Chrysanthemams．

This Manure is just as valuable to the Market Grower，who has to produce dozens of blooms upon each plant，as it is to the Exhibitor，who only leaves two or three to develop．The use of it in either case produces size，brightness of colour，and substance－thas securing for the Market Grower the top price in the market as well as giving the Exhibitor＇the premier honours at the cahibition－table．Analyais and all partioulars post－free from the Manafactarer of the XL ALL Epecialties－

\section*{TOHN EVELYN.}

THE long roll of English amatear bortioul. turists containe no more attractive a name than that of John Evelyn-or "Sylva Evelyn." Luoy Aikin desoribed him as "that model of a meritorious English gentleman." "I know no man," suyb the poet Cowley, "that possesses more private happiness than you do in your garden, and yet no man who makes his happinemn more publiok by a free oommunication of the art and knowledge of it to others. All that I am able yet to do is only to recommend to mankind the search of that felioity whioh you instrnot them how to find and to enjoy." Columns might be flled with the things whioh Evelyn's contemporaries have said about him ; but it is more partionlarly with Evelyn in connection with Sayes Court and the newly-established Deptford Park that forms part of the old eatate that we are concerned.

The manor of Sayes Court, originally known as Weat Greenwioh, has a very ancient history, which, indeed, goes baok to the time of the Conqueror. But it is not at all necensary for va to penetrate very far into the dim mists of obsoarity, and it must suffice us to point out that the name of the place dates from the early part of the twelfth centary, when, by marriage, it passed into the possession of Geoffrey de Nay, who was one of the most distinguished men of his \(t\) me. The estate remained in prasession of this family until early in the fifteenth century, when, in default of a heir male, it paseed into the possession of Sir John Phillip. After various ohanges it was, towards the close of the sixteenth oentury, in the possestion of the Browne family.
It will be iaterenting to quote the description of the place as it appeared to eye-witnesses in 1608 and in 1651 , respeotively. The surver, whioh bears the date of Jaly 25,1608 , reports at follows in Sages Court:-I his house oonterneth eightteene severall roomes and twoo ntoris high, and ngne bayes and gardens, and orohards contayning by estimacion two acres and a halfe, also a stable on the west end of the stalles and a loft or gardener of four bayes valued by the jary by the yeare (in good repaire), iiij \(1 .{ }^{.}\).

Forty-three years later, another survey-dated June 2, 1651-was made of the plucw, and from this it will be seen that it value, at all events, had conviderably increamed since 1608. The survey says:-"Manor house built with timber, with the apptenanoes thereunto belongeinge commonly oalled Sayes Court, Deptford
consisteinge of one hall, one flur, one fitchen, one battery, one larder, with a daryuhouse, slsoe one chamber and three oellorm. In je reand torie eight chambers with foure closentts, and three garretts, two stables, and one other litule stable joyninge to the aforesaid mancr howee, whioh afortiaid manor hotso, toguber with the
said garden, orchard, and court yards, ounteine together two acres, two roodes, and sixteene perches. xiiij 1.

Whilst in Paris during 1646-7, Evelyn became acquainted with the English Ambassador there, Sir Richard Browne, and on June 26, 1647, he was married to Mary, Browne's only daughter, and finally settled with his wife at Sayes Court in 1652. The Brownes held a lease from the Crown of the manor, which had been seized by the Parliamentarians. Evelyn obtained the King's leave to compound with the occupiers, the King also promising, in the event of a Restoration, to secure it to him in fee farm. He succeeded in compounding for \(£ 3,500\); he also obtained leases from the King after the Restoration.
Although Sayea Court iteelf had only a comparatively amall garden of a couple of acres attached to it, the manor itself would appear to consist of 260 acrer, according to a letter which Evelyn quotes in hia Diary, under date, October 21, 1642. The diarint began to alter and improve the place soon after he took ponsession. Under the date January 17, 1653, Evelyn has an entry in his Diary to the following effect:-"I began to set out the ovall garden at Sayes Cuurt, which was before a rude orchard, and ull the reat cne intire field of 100 acres, without any hedge, except the hither Holly hedge, joynirg to the bank of the mount walke. This was the beginning of all the succeeding garden, walke, grover, enclosares, and plantations there." The late Mr. Nathan Dewn, the anthor of a very interesting and complete little History of Deptford stater, that among the MSS. at Wotton, is the following notice of Evelyn's work at Sajen Court:-"The hithermost grove I planted abuat 1656 ; the other beyond it, 1660 ; the lower grove, 1662 ; the Holly hedge, even with the mount hedge below, 1670. I planted every hedge and tree not only in the garden, groves, \&cc., bat about all the fields and house since 1653 , except those large, old, and hollow Ems, in the stable coart, next to the newer; for it was before all one partare-field to the very gardan of the house; from which time also I repaired the rained hoase, and built the whole end of the kitchen, the chapel, the buttry, my stady above and below, cellare, and all the outhoases and walls, atill-house, orangerie, and made the gardens, \&c., to my greas cost, and better I had don to have palled all down at firat, but it was don at several times." In Sylva, 1683, Evelyn farther records:I planted all the out-limits of the garden and long walks with Holly - 400 feet in length, 9 feet high, and 5 feat in diameter."
Evelyn's residence at Sayes Court extended from 1652 to May, 169t, a period of forty-two jeara. Ho was a pronounced Royalist, but occupied himuelf vary little with pablic affairs daring the Commonwealth, and confiaed himself, in fact, to the cultivation of his garden, to writing books, and to corremponjing and associating himself with the learned men of the day.
It would require columns merely to enumerate the many celebrated men who vinited Evelyn at hit renowned retreat at Daptford. Among otherl, wo may apecially mention John Dfyden, the poet; the Marquil of Argyll, who bhortly after had the misfortune to lose his head on the scafold; Lord Lothian, Earl of Southampton (Treasarer of the Navy), the Qaeen-mother, with the Earl of St. Albany, "and many greate ladies and peraona." Abraham Cowley wrote his aix Latin booke on plants daring his residence at Daptford, and the gardens at Sayes Court are anid to have helped him greatly in this. Mr. Jasalie Stephen ataten that Evelyn was on friendly terms with John Wilkins, the warden of Wadham College, and afterwarda Biahoo of Cheater ; and with Robert Boyle, to whom in 1659, he addrensed a letter proposing a weheme for bailding a sort of college near London, where a few men of acience were to devote themuelven to the promotion of experimental knowledge. The outcome
of this proposal was the Royal Societr, the firat meeting of which was held in January, 1660-1. Both Charles II, and James II, showed Evelyn much favour, which perbaps was a questionable sort of a compliment; Evelyn had no sympathy with the profigacy of the court of the former, and atill less, if possible, with the rarcalitien of the latter. His attention and time became more and more devoted to scientific and other subjects apart from politics ; and when the Ryvolation came, he retired entirely into private life.
The decadence of Siyes Court dates from the time when Evelyn left it to settle with his brother George at Wotton in 1694. While he was in residenceat Sayes Court, Evelyn was constantly receiving distinguished visitors, as readers of the celebrated Diary are well a ware. On April 30, 1663, Charlen II. came "to honour my poor villa with his presence, viewing the gardens, and every room of the houne, and was pleased to take a amall refreshment. There were with him the Dake of Richmond, the Earl of St. Albana, Lord Lauderdale, and several persons of quality." Two vears later, another distinguished diarist, Samuel Pepys visited Sayes Court, as the following entry in his Diary hhows:-"1665, May 5. After dinner, to Mr. Evelyn's ; he being abroad, we walked in his garden, and a lovely noble ground he hath indeed. And among other varieties, a hive of beer, so as, being hived in glass, you may see the been making their honey and combs mighty pleakantly." Pepys' Diary contains frequent mention of Evelyn. An exceedingly fine series of anpublished letters from John Erelyn to Samuel Pepya wan in the ponsension of Mr. S. J. Davey, of Great Rassell Street, five years ago. Oae of these contains a very quaint request that Mra. Pepys should call in "Plantear de choux herbam parietaream Sr. Roger L'Estrangeanything but Sc. P Plitick." Another of these unpablished lettera, dated 1668, has reference to America; in it he mentiona a captain whom he had the pleaanre of meeting when he last dined with Mr. Pupye, and nuggests that, as this gentleman is abjut to take command of some forces in Now Eagland, he woald do him a favour if he would collect for him some of the vegetables and natural productions growing in that country. He oncloses a list of the pames of the plants he requires, and also those growing in Virginia, and of which he is aoxious that Captain Nicholson shoult obtain some seeds.
The Great Frost of 1683-4 dealt very hardly by Mr. Evelyn's aylvan retreat. In his Diary, under date of February 4. 1684, he writes:-"I went to Sayes Court to eee how the frost had dealt with my garden, where I found many of the greener and rare planta utterly deatroied. The Ocanges and Mirtilis very sick, the Rosemary and Lanells dead to all appearance, bat the Cypress likely to induce it."
The thinge which the Great Frost did not deatroy were eventaglly exterminated by Admiral Bonbow and Peter "the Great." "I went to Deptford," witen Evelyn, on Jane 1, 1696," to diapose of our goods, in order to letting the house for three years to Vice-Admiral Banbow, with condition to leep up the garden." How far the last clause in the agreement was kept up, the following lines will show:"I have let my house to Captain Banbow, and have the mortification of aeeing, every day, much of my former labour and expense there imoairing for want of a more polite tenant." Ia 1698, the final blow was given to the bearties of Sayer Court. The Czar of Rasaia, Peter the Great, "being come to Eagland, and having a mind to the bailding of nips, hir'd my house at Sayen Court, and made it his Coart and Palace, new farninh'd for him by the king." One of the Czar's pleasant pastimes, it appears, was trundling of a wheelbarrow through Evelyn's favourite Holly-hedge, to which reference has already been made. "Is there," asks Evelyn, under the heavens a more glorious and refreshing object of the kind than an impragable hedge of almost 400 feet in length, 9 feet high, and 5 feet in diameter, which I can atill show in my rained garden at Sayen Court (thanky to the Tzar of Muacovy), at any time of the year, glittering with ite armed snd variegated leaves, the taller atandards at ordinary
diatance, bluehing with their natural coral It mocks the rudest assanalts of the weather, beath, or hedge-breakera-et illum nemo impure lacesit.!
The damage inflicted on the place by this preciou pair of tenants was appraised by a committee con prised of Sir Christopher Wren, Mr. Sewell, add George London, the king's gardener, at \(£ 350 \%_{\mathrm{o}}\), of which amount \(£ 55\) was in respect of the garden, London reported that the "aeveral diworders" here came under two heads, "one is what can be repitred again, and the other what cannot be repaired. London reported that (1) all the grass work is out ol order, and "broke into holes by their [the Ravina Court] leaping and shewing trick apon it;" (2) the bowling-green is in the same condition; ; (3), all the ground which used to be culcivated for "eutibo" plants is all overgrown with weede, and it at manared nor caltivated, "by reason the Zuy (icic) woald not anfer any men to work when the newon offered ; (4), the wall frait and "stander" frit theen are "unprained" and unnailed; (5), the hedgan or wilderness are not cat as they ought to bo; and finally (6), the gravel walks are all "broke" into holes and out of order.
If this succession of calamities were inanficieat to drive away the gentle Evelyn, he would have been more than hnman. He removed the remsinder of his goods to Wotton on May 24, 1700, and Sayen Court has never nince been inhabited by any meabor of the family. The subsequent history is soon told, and its viciasitudes might almost employ the pen of an elegiac poet. In 1759, the house wat let to the veatry of St. Nicholap, Daptford, to be uned as a workhouse. In 1820 the old bailding was in gras part demolithed, bat tha workhonse remained on the site till 1848. Is 1881 all that marvived of Saju Court was converted by its owner, Mr. W.J. Eraln, into the almshouses, for the accommodation of old renidents on the Evelyn eatate. In 1886, Mr. Evelja gave part of the old grounds to form a pabie garda, with an enduwment for keeping it in order; and in August latt, the remainder of the grounda was adided to this pablic garden, after bsiag tattefally laid ots from the design of \(\mathbf{M} \%\). H. E. Milner, the well-kwow landscape gardener.
Of the gardens, therefore, which once formed tho glory of Sijes Cuart, and the pride of John Eielsh, only 7 acres have entirely encaped the bailder. Bus the inhabitants of Daptford may conader there selvea exceedingly fortanate in possensing thio \(m\). desirable breathing-place in tha heart of this denenty popalated neighbourhood. That it is being appro ciated is demonstrated by the fact that in a fot nizht from the day of its informal opening (Augut in, 1895), nearly 8,400 people pasaed through its pater Mr. Evelyn has had it laid oat entirely at bio on cost. At present a conaiderable variety of trees and shrubs is Hourishing is the gardens, nearly all of them being decidaous, as the smoke and dirt of the place would acarcely permit of anything in the then of evergreen shrobs or treen flouriohing there Several varieties of Barberiv, notably squifolien Aucaban, Luarelf, Bux, two varieties of Cotoneantion Pgras Maluz, Craypgus, Lilac, Privet, Weigetan Mouatain Asb, and Yailadelphas coronarias, all flourish here in a highly aatiofactory manner. gardens are under the charge of Mr. Callaghain who has been in Mf. Evelyn's employ for some "spers. The place presente much of the "unclothed "sppetr" ance of a newly-laid out park; but in the coarte the next five or ten yeara it will partake somental of the character it possessed two centaries and mure ago-it will be "most bocarenque," as one of \(\mathbb{E n}^{\prime}\) Evelya's visitora than described it. The en
Puplar, and Pane trees have all been growing bere Puplar, and Pane trees have all been growing bell Mr. Tanalkfull Stardee's photographs ( \(\mathrm{i} 3.98, \mathrm{p} .577\) fig. 99, p. 579 ; and ig. 100, p. 531 ) give perhapp \({ }^{1}\) more "bocaresque" appearance than it renlily \(p\). eesses, but beyond this they are faithful to nsture.
Apart from this alice of an entate which mand slwaya remain famous in the annals of the math horticalture, and a reminder of one of the the aeventeenth centary, it may be pointed out that the

London County Conncil purchased, in 1894, of Mr. W. J. Evelyn, a space consiating of aeventeen acres : this epace is almost half-a-mile west of Sayes Court, adjoining the Grand Sarrey Canal. The price paid for it was \(£ 36,000\), and the place is now rapidly being formed into a pablic park. But this piece of ground formed no portion of the gardens in which John Evelyn so delighted, alchough it bas boen the property of the Evelyn famlly since they acquired the estate. W. Roberts.

}

Leopoldi. A plant of it has long been in the Palmhoase at Kem, where it flowers annually, and is in flower now. It is shrab 6 feet high, with a atraight, woody stem, branched above, and clothed with oblanceolate leaves 18 inches long by 6 inches In width. The flowers are borne in terminal clusters, a dozen in each clanter, and they expand in alow naccesaion. They are in the form of a shallow cap 4 inches in diameter, composed of four fienhy, ovate-concave petals, white, tinted with rome, and a c snapicaons corona-like ring of vellow atament. They are deliciously fragranto G. gracillima, a apseie with linear leaves and roso-tinted flowers, wat in flower in the ame house a few week ago.

\section*{Anona Chermolia,}

A plant 4 feet high, grown in a pot, has this year ripened neveral fraits in the Palm-house at Kew. They are about the aize of an ordinary Apricot, dark-brown in colour, their pulp being yellow, and delicions both in aroma and taste. Hat any one ever tried to grow this fruit in Eaglish fruit-houses? If it could be grown as Penches, for inatance, are grown, and would frait freely, it could acarcely fail to become populap. It is largely cultivated in
tropical countries, the Creolea counting it the mont daliciou of all fraite, and they ought to be jadgen.

\section*{Dioryyeos Kay.}

Ripe fraite of this, the Chinese Date Plam, may now be seen on two plants in the succulent-house at Kew. They are as large an good-sized Oranges, and of a rich ecarlet colour. The condition of this houve seem to suit these plancs, which have fraited annually aince they were planted in the border among the Agaven, where they get plenty of air and annshine.

\section*{Lyoonis auma.}

The handsomest bulbous plant in flower at Kew in November is this Lycoris, of which there are about a dosen potes, each bearing tbree opikes of flower in the Begonia-honve now (ace fig. M4, p. 645). The flowers may be likened to those of Nerines, bat they are three or four times as large en the larget Nerine, their colour being rich goldenyellow. At Kew the plante are grown in an intermediate-hoase all the winter and apring, and when they show an inclination to go to reat, they are stood outaide in full sanshine, where they get whatever rain falla. In October they are removed into the house again, and a few are placed in a atove to induce them to flower early. Thus treated there have been flowers of thi plant on exhibition in the houces for the past month or more. I am convinced now that thi beautiful Chanese plant, which, by the way, was introduced into tiagland over a bundred yeare ago, remaine ankoon to most caltivatore, only because the fow who have attempted ite caltivation have failed through not giving it afficieat hoat. In a tropical climate like that of Hong-Kong it is a popular garjen plat, growing with the amo treedom as Daffudile do here. W.W, Kew.

\section*{Orohid Nutes and Gleanings.}

ODONTOBROSSUM MACULATUM.
With reference to the remark ander Odontoglossum crispuan Devoniense, at po 503 of the Gardenars' Chronicle for 26 th altimo, 1 beg perminaion to say that I have at present in bloom plant of Odontoglonsum macatatam bearing three fine fowerapites out of one bulb, \(t\) won beigk on the apex, and one on the side. C. Bo, The Aoacias, Worthing.

Onchids at The Dele, Eonam。
With the older plants of this grand collection of Orchid in unabated vigour, and the inclusion of every worthy new plant, either specie or hybrid, it is not surprising that Baron Sir H. Schroder, at The 1) all, Egham, attracts the gardener and the botanist from all parts of the world.

In the large commodiou plant-houser a nuccention of floral diaplay is to be found, the component parte of which vary with the eeasons. Eiurly in the year we recall the aplendour of the gronp of Mandevallise and Odontoglowame, whowe united moneyvalue would represent a moderate fortune; then, a charming diaplay of Cologgne crishata, unally net up with Maidenhair Ferna, the two moat attractive specimens noted being a Cologyne cristata alba, wome 5 feet acrous, and bearing upward of 600 flowers; and a atill larger Chateworth variety of Cuelogyne, with about 1000 blooms. And \(s\) on in anccestion, each clans of plant represented in auch beaaty and completeness an to leave a atrong impreanion on the mind of the beholder.

At the present time it is needless to eay that the main thow is made up of those two admirable plante, the autumn-flowering Cattleya labiata, and the varietien of Dendrobium Phalsenoptia Schroderianum, which everyone regards an being among the bet introductions to gardens ever made. of the Cattleya labiats, one of the new hoases is filled with their glowing warm row and crimson flowers, acarcely two of which, it may be remarked, are exactly alike. Among them is a very beautifal albino, C. labiata Counten Fitzwilliam, with Gowern of anowy whitenear, with a chrome-yellow base to the labellum, the diac of which is pale pink or blowhwhite. If the same house are some plants of The

Dell hybrid Cattleya \(\times\) Baroness Schroder (Trianæi \(\times\) Jongheana) in bloom and bud. This crose-bred plant has charming rose-pink flowers, with a yellow and white tabe to the lip, and is the most lasting of late-flowering hybrid Cattleyas. A atrong plant was noted of another fine thing raised at The Dell, viz, Lalia \(\times\) vitellina, whose fine Indian yellow flowers are very attractive, and has flowers in sheath.
The adjoining house is a moist, warm one, which has been arranged in every way likely to make it saitable for the culture of Phalrnopsis, and in it these plants at the present time seem to be quite at home, promising a good show of flower at the proper seanon. At present, thone in bloom are Phalænopais Lowii and P. violacea. Phaias tuber culosus also grows and blooms in a most satisfactory manner in a alady corner of this house; and plauts of Miltonia Roezlii and others requiring similar temperature and atmospheric conditions, seem to be suited in this house.
In the next range of three span-roofed houses, in the firts of which is a fine batch of the bronzy-leaved Begonis Gloire de Sceaux ; in the second, suspended over groups of colonred Crotons and other foliage plants, is a most charming display of the elegant sprays of Dendrobium Phałænopsis Schroderianum, D: superbient, and others of its class; and in the third, the centre stage of which is filled with the collection of varieties of Lalia anceps well-furnished with flower-spikes, is a grand group of Dendrobium formosum giganteam laden with its large white and yellow flowers.
Passing through the lofty Camellia-house we find evidence of an important condition of success in Orchid cultare, viz., to grow the plants well in the season of growth and rest them afterwards, in the great number of deciduous Dendrobiume suapended in the cool dry air of thit house. Each one made aplendid growth in the warmer houses, and here they are placed to become well ripened, and in consequence fitted for flowering. In this house in full sunlight Leelia majalis thrives and flowers freely.

In the large Odontoglonsum-house, the vigour so often noted in the apecimens, many of which are unique, is unabated, and the plants are well farniahed with stoat spikes. Among other things in flower are the beantiful orange-lipped Oacidium Lozense, with a fine branched spike of striking large flowers; Oncidium saperbiens, with white, purple, and brown flowers ; and varions others of the class which bere grow to a great aize, one plant of Oncidium macranthum having had nearly 180 flowers ; and Odontoglonsum Edwardi, gigantic branched apikes of its violet coloured blooms.
In the warm tank-house, about the centre of which the Pitcher-plants are uapended, is another charming display of Dindrobiam Pharænopuis Schroderianum, with the pare white D. Dearii, the fragrant white Angrecum Leonis, and a few other apecies. On one side the plants of Vanda teres produce every summer a great show of bloom. Here a pecaliarity in the nearly white V.t. Aurora, which in now in flower and in bads of varions stages of matarity, in noted, viz, that it is almost perpetualfowering, for an fast as a leaf or two in made, an inflorescence appearn. On the other side is a group of finely-grown Habenaria Suzannæ, nome of the beat spiken having each five of their beantifal and singular flowers; almo H , carnea and H , nivoma, all of which are well under management in this honse, which seems to suit them admirably.
Next we pass to the Cypripediam-hoases, in which there is a never-failing show. The varieties of C . insigne are coming on, and soon three lowera will be expanded on the clear yellow C. insigne Sandere, which is firat favourite. There is also a good thow of C. Spicerianum; varieties of \(\mathrm{C} . \times\) Leeanam, C . Charlesworthii, C. \(\times\) conanthum superbum, still the bent of ite clans; \(\mathrm{C} . \times\) marmorophyllum, C. \(\times\) Chas. Canham, the riehly apotted C. \(\times\) Southgatei, C. \(\times\) Antigone, C. \(\times\) Niobe, C. \(\times\) Galatea, and a number of othera, and the rare C. Stonei platytreninm, and other cherished tresaares are increaning stendily in nize and strength. Arranged on one side of the
P. Wallichiana, and P. lagenaria, literally covered with flower*.
In the large stove-house, the centre of which is thinly arranged with gigantic Anthurium Veitchii, A. Warocqueanum, and A. Andreanum, furnished with fine scarlet apathes, is a splendid collection of Calanthes, some of which are coming into bloom, while all are furnished with stout spikes. The best of thene, without doubt, is that gigantic and richlycoloured hybrid, C. \(\times\) Baron Schroder, raised at The Dell, and which it seems difficult to surpass in beauty. It is a marked instance of the benefit to be derived by asing only the very best varieties in raising crosseg. Here are the violet-flowered Utricularias from Roraima suspended from the roof, and the lighter blae U. Eadresii, all of which give such a profution of bloom in their season; the pretty Pachystoma Thompsoni, Oncidium papilio, O. bæmatochilum, Ceelogyne Massangeana, C. speciosa, Cyc noches chlorochilon, and with some beautiful selected plants of Dendrobium Phalænopsis Schroderianum, the pare white D. Phalænopsis virginale, which has no other colour than a faint blush on the lip.
In the large Cattleya-house, the Baron, fall as ever of interest in his Orchids, pointed out come of the old inhabitants of the house whose long-continued good health he attributed to growing them well, but not overdoing thema coarse which, as he says, must either result in ascrifice of flowers or collapae of the plant after a time. Among the were the first plant of Cattleys Bowringiana ever purchased, and which is now a fine healthy mass with five grand spikes; the original plants of Lexio-Cattleya \(\times\) Dominisna and its variety ronea (C. Dumiana \(\times\) L. purpurata) first flowered in 1878, and which are now among the noblest of hybrid Orchids; one of the earliest plants of L.-C. \(\times\) exoniensis and various other which are regarded by the Baron and hir gardener, Mr. Ballantine, as old acquaintances. The house is bright with flowers of Cattleyas, Lexlia Perrini, Laelio-Cattleya \(\times\) Cassiope, L. \({ }^{-}\)C. porphyrostele, L..C. \(\times\) Eaterpe, and other hybrids, and smong plants of special interest noted were the Lamberburat bybrid Cattleya (intermedia \(\times\) citrina) and Lalio-Cattleya \(\times\) Digbyana Mossix, recently figured in the Gardeners' Chronicle.
Passing to the lofty rockery-house, clad with Ferni, \&ce., we come to the lean-to range of cool intermediate-honses, in the first of which the planta of Miltonia vexillaria are grown; we find in the second divition nome of the rarer Odontoglonsums in flower. Of these the most beautifal were the violet-spotted O. Peacatorei Schroderianam, of which there were three fine, branched spikes; \(0 . \times\) Wilckeanum Godefroy \(\mathfrak{x}\), a grand sellow flower, deniely apotted with rich brown, and which we always think is no Wilckeanum, for its form differa, its flowere are more flatly displayed, and more beautifal than those of Wilckeanum is ; the very pretty 0 . Wattianam, O. Sanderianam, O. Bictonense album, O. cirroanm, and just paseed a grand O. crispum, which has borne thirty-two noble flowers on its apike. Then follow the hoase of Masdevallias ; a house of noble specimens of Coelogyne cristata and C. c. alba, with a row of finely-flowered Lxelia prertans, and one apecimen of the superb L. p. alba with pare white flowers marked with purple on the lip. Beyond are the houne of Vanda tricolor and V. anavie in aplendid condition, with Vanda Kimballiana and V. coeralea, Cyperorchis eleganv, and Cgmbidinm giganteum, making a good show. Then we enter the mall house set apart for Lycaste Skinneri, followed by a house in which are a number of Oncidiums in flower, and some plante of Dendrobiam cruentum; and then a long lean-to house filled with foliage Begonias on the stage, and numerous specimens of species of Dendrobiam hanging from the roof,
In the next range in which Fittonias, \&cc., are planted where possible are the collections of Aërides, Saccolabiuma, and warm-house Vandas, among which nome excellent examples of \(V\). Sanderiana were in bloom. Here, too, is evidence that carious botanical plante are not alighted, for among a collection of
such plants in bloom were Catasetam Christyune C. saccatum, C. Gnomus, and several apecimens of C. param, Gzleandra Baueri, and other prethy apecien. As in other collections, dificulte mabjetety are often encountered at The Dall, bat with neth the Baron and his gardener, Mr. Ballantine, have an unfailing method, and that is, to "atick to them" until they are made happy.

\section*{ADHATODA CYDONIEFOLIA,}

How seldom at the present day is this old dorsclimber seen in collections! it having been albowed out by the numerous foliage plants with which our modern stoves are more or less filled, of comme, these latter are valuable additions to wellyrom collections of planta. Still, where there is a fisd spare room, I think no plant-lover world mom adding to his collection the one named abon. Itit best seen to advantage when grown as a pilar. plant, though where this position is not arsilable, it can be trained up the roof of any ordinary plantstove. Dar plant is in mach a position, being afineed to three longitudinal wires up the roof under a ralter, juet as Vines were trained to in old-fabhioned vineries. It is planted in a brick encloure ander the hotwater-pipes that run beneath the sideatage. It is best to raise this enclosure, say a coople of bricks in depth, above the surrounding aurface, to prevent the soil therein from becoming sodden. The mixture of soil we use is two parts aandy loam, to one part turfy peat, with some broken clinkera aded to keep the ail sweet. Good drainage was put in the base, covering this with a thin turf, to prevest it from becoming clogged. After the enclonare is fall of roots, weat doses of manare-water are afforded daring the sammar monthe, at which time the plant is in fall growth. Its period of flowering is daring the month of Ostober and Nivember. The droop. ing apray covered the whole length with dark green opponite, ovate leaven, from the base of which spring small clastars of purple and white Jasticia-likg foowers, have a very pretty eff set. Uafortanataly, they are but whort-lived when ued for indoor decoration, though wa have occasionally used them for laying on the cloth along with nuitable folitys in decorating the dinner-table, Ualike purple flowers generally, the pecaliar ahads of this Adhatoda comsa out vary well under artificial light. When the flowering period is past, may in Jsnaary, we cas our plant back to the main atems, keeping the roost on the dry side for a few weeka as the asme time. Whan it begins to grow again in March we water as before. So far as I know, the plant in quastion is not anbject to serioun attacks by any of the many ineect pests that too frequentiy infest stove-plants in general. We have tried it as a babket-plant, brif have not succeeded so well as we could wish. \(H\) J. 0

\section*{POTATOS.}

I mpon regretted being compelled to leave the Drill Hall at the clone of M \(\%\) A. H. Satton's man intereating and well illustrated lecture on Potatoon which he delivered on the 29 :h ult. True, very much that he said, off red no room for criticim, and but little suggested discuasion. Juat ons or the points, howevar, marited notice, and conld I have remained, I should have referred to them then First, in mentioning the need for removing the atrmans from flowers before attempting crovr fertilization, Mr. Satton laid down what is held \(\omega\) be an essential axiom in relation to all selfferertilising flowers that is indispatable; but I have found the garden Potato to be an exception, and I uee ths term to differentiate it from the varions apecies the which Mr. Satton made peecial reference. Tm great characterintic of the flowers of garder and field Potatos is their pollen-barrennesy, which wis it not be absolute, but is comparative. Si nearily absolate, however, that not more than one varien former, hence they all drop, and there is no weed-prodnction No doubt that fasture is dua to the exhanatiat
arising from the great production of tuber the plant now exhibit. Seeing that in Potaton the processes have to run coterminous, and are not found in diverse seasons as is the case with so many other thingo, the reault is not remarkable. Thus it is that Potato-flowers, when pollen can be obtained from any source (and jaut a few varieties do have plenty of pollen), may be ferlised freely without interfering with the atamens, unless it be thone few varieties that do produce pollen freely, and it is rare indeed that these are emploged for seed-production. They may, and have made, excellent pollen parents. Certainly pollen sufficient to produce fertilisation of one or two flowera may be obtained by perveverance from many apparently-barren blooms, as I have frequently found; but never in any care hat any individual flower of these varieties prodaced fruit by self-fertiliastion. It is a carious aspect of flosencence neen in hage areas of lotatos in fall bloom one week, and the next not only not a flower is to be found, but not even a berry-
on what has been proved to be the moat dimenentricken soil in Sarrey. I do eincerely hope it will be teated also at Chiswick on the Putato trials henceforth, for it is most distressing to see apparently fine cropping varieties tarned out rotten with disease. Bat there can be no doubt whatever that a benefit resaltant from dreaing even diseaseresisting varietie of Potatos with the Bordeaux Mixtare arise from the longer preservation of the foliage, thus helping, as only through the agency of leafage can it be helped, to develop greater atarch production in the tubers, though no material addition may be made to the balk of the crop. There can be no doubt whatever but that atarch is more fally developed in the tubert after they havo reached their maximum aize, and the proces of ripening is proceeding, than at any previous period in their growth. Thas the retention of leafage for bat three weeks longer on the plant becomes, for this purpose, a matter of vital importance. That there is so much complaint every year an to the absence of

Fig 99.-virw in the eyelyn pabk at deptrord. (bee p. 576 )
rcthing but the bare atem to show where the flowers have been.
The angegtion of the lecturer that with mo many fine comparatively disease-resisting Potatos in cultivation, even in most adverve season, it does not pay to apply dressing of the Bordeaux Mixture generally to them, is quite true. That is epecially so in relation to field culture. I conducted trials of all the bent early and late varieties of Potato in commerce daring the past ummer, in Surrey, on numerous plots and diverse soils. In the majority of caver disease gave about 3 per cent. of injured tabers only, but there were two cases, both on the light poroue and evidently over-charged nitrogenoas soil of the allotment-ground at Richmond, where the disease played havoc with all aorts, early and late, disease revisting and otherwise; none were unbarmed, and the bulk to the extent of two-thirds, at least, very bad. The soil is mo much like that at Chillwick, where also diseave way apparent, that it is evident there are condition under which it would pay well to employ the Bordeanx Mixture freely; and if I have to mperintend any Potato trial at Richmond next year, I trust it will be volely for the purpose of testing this liquid compound,
quality in Potatos, is largely due to the fact that the foliage is deatrojed by the diseave ere it can complete it proper work of maturing, there can be no doubs.
This matter naturally lead on to the convideration of another, reapecting which a long paper might be written as to the connection between colour of Potato fleeh and flavour. Mr. Satton refersed to the diverse varieties of Potato grown on the Continent, not ouly for food, bat alvo for furnishing atarch and sugar to be converted into alcohol. Comparing them with ours, the continental Potatos have gellow flewh, we prefer white flenh tubere, and grow tho almont exclunively. We here how that same stupidity which characterisen the nation in it preference for liabby white boneless bread over that of wholemeal, which is coarner in texture, but more healthful. Is is a fact, I think, indiaputable, that yellow flouh and flavour, if there be too abundant starch, are allied. The white flenh tubers give timealinens or flourinen when they are matured, but they lack both wharch, which in the chief flenh-forming principle, and flavour-why this odd antipathy to jellow flesh? Cariously snough everybody like and extol the A shleaf Kidney, which
has in it a considerable body of yellow Bewh, both for it nutty quality and favoar. Who does not remember the old Victoris, so good, one of the beat flavoured of Potatos, with its (when well cooked) yellow body conted with whitish flour-like crystallised sugar. Hive we to-day it equal, or that of the Asbleaf, for Gavour! Mr. Bobert Fenn, when be raised his old early market Rector of Woodutock, Woodntock Kidney, gave un delicious flavoar, but eo soon as be utilised the white with Americans an parents of cronses to secure size, he found flavoar to decrease. It is the amme with all our varieties. The very beat favoured Potato I have raised. The Dean and Renown, were out of Woodatock Kidney, and they have good davour, su also bat Reading Ruanet, which in so exeellent when fally matered and cooked well, but these all have yellow bases. Wo have cot varietie that produce crope well an nize in tabert. that satinfy all needs-indeed, to-day Potato are cheap almont beyoad all precedent. We can now affurd to derote more attention to starch and favour production, but if we will have these elements we mut have yollow fleah also.

I finally aggent to chemints whenever they analyse Potatos they do so in a cooked atate, as we partake of them an a food, and not raw. What are the changes cooking bringe about I cannot asy, bat they ard considerable. Still further, perhapa, they will tell ut what ingredienta we can apply to toils that shall give us starch and flavoar, where now it is lacking. \(A, D\).

\section*{THE SHOW TULIP.}

I thase lit ponible"the garden ahow Tulip mas once more grace/the tables of our exhibitions in large numbers, for Mr. P. Burr seems to have set his heart on the revival of this once immenselypopular flower; and we all lnow, that ahould he really be in earneat in the matter, that it will aoon be an accomplished fact. Such I glean ia his intention from a letter received from him som, little time eince. For severnl years I ased to act an ceneor to the Vale of Evesham Fioricultural Sjciety, which held ite \(m\) onthly meetinge in the Tuwn Hall. Thie was, atricsty apeaking, a society of the old school of ff oriste who studied the properties of flowers to the very letter, and who never could balieve their owa ejes; for every flower had to be examined through a pair of apectaclen before they could trust it to be ataged. However, I admit gaiaing many "wrinkles" from some of the members of the old echool, and passed many a convivial hour in their mociety. The members held four thows anauilly, at times enitable for their favourite linde of floriats' llowers. I regret to esy, that since I left the neighbourhood, now nome yeari ago, most of the principal member of thi old achool have departed thil life, and the riaing generation seem to be lacking in energy in upholding wach shows at were the pride of their fathers; and this particular society, like so many others, is now numbared with the thinge of the patt. Should Mr. Barr take the Tulip in hand, his own extensive bulb ground at Thamen Ditton would be very auitable for their culture, sad a grand display might be given annually there, which woald no doubt, ss of yore, draw florist from all part of the United Kingdom. Now, we do not expect people to get eo excited in theme days ovar the Talif at to go mad, as was evidently the case when the calture of the Tulip wat at ite highest, about 1636. We do not expect to hear of the gambling apecklations that were once carried on during the Talipomania; the bulbs were than sold by weight in perita or grains, and some brought prices which would heve purchased a small entate. A variety called Semper Augustus, I have read, was sold for 2000 florins, and it once happened that there were oaly two roots of it to be had, one at \(\Lambda\) msterdam, the other at Hearlem. For a bulb of this variety one person agreed to give 4000 florins, together with a new carriage, two grey horser, and a complete set 0 ! harness ; and another agreed to give 12 acres of land for a bulb; and in one inatance Talip brought a profit of more
than 60,000 florins to a dealer in four monthe. Noblemen have been known to give weep 2000 forins for Talip-bulbs ; and we are told that in one town in Holland in three years more than \(10,000,000\) florins were expended in this trade. In another instance, a person who possessed a yearly income of £2800 wan redaced to begging in the whort space of four monthe by purchasing flowers and bulbs. It is also anid that a pernon who possenied a very fline Tulip, Learing that there was a second root of the ame kind at Haarlem, repaired thither; and after parchasing it at an enormous price, placed it on a flagatone, and pounded it to pulp with his feet, exclaiming with exaltation, "Now my Talip is anique!" Now, of course, we do not, in these hard and enlightened times, expecs any such folly, or high trade prices to rule; we thall not have maid-mervanta, footmen, wweep:, \&rc., apeculating at of yore; but high price may again come to the fore. The difficulty seemn now to be, in getting a first-clans collection together. The last bede of valuable Tulips I anw were at Mr. Groom's, Clapham Rine, about the year 1852. He had at that time one bed, 130 feet long, containing the cream of his col-lection- 1700 balbs, and altogether 200,000 in and out of flower, and the prices he alked were exceedingly high, ranging from 100 guineas downwards. Mr, Middlecot, of the Greyhound Inn, Dalwich, also had a fine amateur collection, which he used to cover with an awniag during the flowering season; but they are also thinge of the past, and we must look to the northern floriste for help in forming a collection, and if these would only advertise their bulbs, they would, I believe, find a ready ale for them.

Raining Tulip: from seed is a very alow procens, the bulbe taking from five to aeven years before they flower, and neveral yearn longer before they break into their proper colours. It in bent to now the meeds in pans or boxes; cover the seed with about a halfinch layer of leaf-mould and loam; keep them from hoavy rains, but not to let the noil get very dry. Wait with patience for the reedlinge to flower, then eelect ach flower as you think most eligible in reapect to shape, colour, \&c. They must be handsomely capped, with clean bottoms, theme being inciapensable in a good flower, whether roses, bizarrem, or byblomens ; elect from these those that nearly approach Glenny's properties of a good Tulip. Edw. Bemnett, Lyne, Cherisey.

\section*{ABOUT CHRYSANTHEMUMS.}

\section*{(Continued from p. 548.)}

DEVONHURST, CHISWICK
A good collection of Cbryanthemums may be aeen in the garden of E. H. Watta, Esq., and when the plante are in flower it is thrown open to the inspection of the reaident of the district at a small charge, the aum thus obtained going to some charity. This mason it is the London City Misaion that will benefit.

The Chrymanthemum plants are arranged in semicirclen, and murrounded an they are with foliage plants, a very pleasing effect is produced in the greenhousen. Mr. J. Gibson, the gardener, is a believer in amall shifte when repotting the plants and in firm potting at all times. The aize of pots omployed in montly 8 inch. The plante are very dwarf in atatare, and the bloom bade are reduced to three on a plant ; the catting-back syatem is not practised here. Liquid from the cow-shed in the only manare applied to the planta, and that very aparingly. The plante were clothed with clean healthy foliage, and produced just the kind of wood from which first-class flowerm are obtsined.
Many good varietien were noted, viz., M. P. Martignac, incurved, good golden-yellow, in the way of Jardin dee Planten; the rony-bluah Princene of Walen was in fine form; Baron Hirnch, orangecianamon, good shape, full bloom, and early In coming into flower; Emprens of India wan in capital condition; sloo C. H. Curtie, an incurved flower of pure yellow. One of the finest of recent introduetions in Commandant Blussett, Japanene, magnificent purple-amaranth
flower, dwarf habit; Dachens of Wellington, clear yellow, with long narrow florets; Mons. Panckoucke is another bright pare yellow, not quite mo rich in colour as Thunberg, but in other respects auperior to it, having Sanflower and Phoobas an good companion: Colonel W. B. Smith, golden bronze, shaded terra-cotta, very fine.
One of the very finest, Viviand Morel, rony-pink, is pare white on an early bud; International, pale yellow-tinted roy-lilac, fine preading flowers. No collection seems to be complete without Charles Davis, a golden port from Viviand Morel, beartifally tinted bronzy-rose; Colonel Chase, pale blush, long drooping floret ; Niveum is a light pink, changing to pure white, a good exhibition flower, and one that should also be an acquisition for market purposen, othera were William Seward, Kentich Yellow, Dachent of York, Julen Forry (seedling from Louise Bchmer), Gairlande, M. Grayer, Mri. W. H. Lees, Madame Carnot, Philadelphia, King of Chryanthemums, M. Paul Lacroix, Robert Owen, and Mre. E. G. Whittle. J. B.

Mrssrs. Prarson \& Sons, Chilwhll Nursbries.
These well-known nurserien, sitate about 4 miles from Nottingham, are just now a centre of attraction to crowd of gardening enthuiast and other from the home and neighbouring counties wishful to see and admire the noted collection of Chryanthemums which is on view. Here they have the opportunity of inpecting all the latent varieties, and judging any novelties without the fear of becoming confued by the glowing deacriptions to which raiser are addicted. A feature adding attractivenenn to the display consiats in the apacious houses in which the plantsare ataged; nud an the pot Vines and other fruit treen, which have occupied them during the anmmer, have been to a great extent disponed of to cuatomern, apace is available for the exhibition without interfering in any way with the numerous house filled with atove and greenhouse plants.

In the principal nhow-house, 100 by 30 feet, the plante are arranged in memi-circular group along each aide with an immense bank at either end. Large-flowering varieties compose the main portion of the groupa, the choicent kind of Pompons forming a suitable edging. Rather a contrast to each other are two adjoining houses, each 100 by 24 feet, the firnt brilliantly gay with bloomn grown eapecially to cope with the large demand for cut flowers, and the aecond containing late varieties to come into bloom about Christman.

A short distance from the above-mentioned houses is the house (not open to the public) devoted to plants for exhibition parposes ; and where may be seen nome slendid blooms, which will, no doubt, figure at many of the forthcoming shown. Amongat the mont conspicuons of these blooms are to be noticed Pallanza, M. G. Montigny, M. H. J. Jonen, Noces d'Or, Dachees of York, Louise, W. Firkinn, M. Panckoacke, Colonel W. B. Smith, W. Seward, Commandant Blansett, Primrose League, E. Molyneux, M, S. H. de Clermont, Dencarten, \&c.

\section*{LIST OF GARDEN ORCHIDS.}

\section*{(Continued from vol. xiiii. p. 684.)}
91. Galiamdra, Lindl. in Bauer 1ul. Orch. Gen., t. 8 ; id. Gen. \& Sp. Orch., p. 186 ; Benth. et Hook.f. Gen. Plant. iii., p. 536; Rolfe in Gard. Chron., 1892, ii., p. 430; Cogn. in Mart. Fl. Brasos iiio, pt. 4, p. 293.-Terrentrial or epiphytic herbs, with fusiform, leafy, or nometimen very hort peudo-bulbe, narrow gran-like leaven, and terminal simple racemen of large or medium-nized flowert, eepals and petale apreading, aub-equal. Lip infundibalar, sub-entire or somewhat three-lobed, prolonged into a apar behind; side lobes loonely embracing column; disc smooth, villose, or with nomewhat thickened nerven. Colamn clavate; anther created; pollinia 2, affixed to crencentshaped gland. Species about 20 , ranging from Brazil to S. Mexico.
(1.) G.barbata, Lem.,in Iul. Hort, iiii. (1856), Misc, pp. 86. 89 ; \(1 d_{0,}\) vil., t. 248; Rolfe, in Gard. Chron. 1892, ii., p. 430. - Brazil,

Amazon district. Introducad by Menre. James Veitch \& Sons, and described from plant which flowered in the establishment of M. Verschaffelt, of Ghent, in 1856.
(2) G. Batemani, Rolfe, in Gard. Chron, 1892, ii. p. 430 ; Veitch Man Orch., pt. is p. G. Baueri Batem Orch. Mex. \& Guat., t. 19 . of Lindl ) ; Bot. Reg., xxvi., t. 49 ; Paxt. Mag. Bot, xiv., P. 49, with plate; Orchid Albwm, vi., t. 267; Puydt, Les Orch, pp. 196, 197, fig. 193.-South Mexico. Sent by Row in 1838 from the neighbourhood of Oaxaca to Mr. Barker, of Birmingham, in whowe collection it ahortly afterward flowered. It was then confused with G. Baueri, Lindl., a very distinct apecie from Gaiana, and the mintare was not found out till quite recently, when is was found necesary to give it a new name, Bateman remarked that it was found some thousand milea away from its original habitat, but, singularly enough he appeasi not to have noticed that it was a different apeciee. A second error also occurn. The anthor itaten that Mian Drake prepared the exquinite dram. ing "assinted by native specimens more recently discovered by Mr. Skinner in Gaatemala," but these evidently belonged to aome other species, a the old bulbe are funiform in bhape. Paydt hat reproduced the error. It is now rare in cultivation.
(3) G. Baurbi, Lindl., in Bawer Ill Orkh, Gen., t. 8 ; id., Gen. \& Sp. Orch., p. 187; Bot. Mag., t. 4701 (var. floribus luteis); Rolfe in Gard. Chron, 1892, ii., p. 431 ; Veitch Man. Orch., ix., p. 6 ; Cogn. in Mart. Fl. Bras., iii,, pt. 4, p. 297. G. cristata, Lindl., Bot. Reg., xxx., Misc., p. 72.-Gaiana. The original species of the genur, deacribed by Lindley from a npecimen collected in French Guiana by Martin, but afterwards confaned with the preceding one by Bateman and othern. It afterward flowered with Mesars. Loddigen in 1840, and was re-deacribed by Lindley under the name of G. cristata. It also flowered at Syon House in 1853, when it wat thought to represent a distinct variety of the preceding. The New Granadan G. diven is sometimes considered identical, but this is doubtfal, as will be seen in a note under that apecief.
(4.) G. Clarsii, Cogn., in Journ. des Orch., iv. (18y3), p. 202; Lindenia, ix., p. 17, t. 301 ; Orch. Review, i., p. 348.-Brazil. This apecies flowered at Kew in October, 1888, when I thought it was probably new, but did not deacribe it. Afterwards it wa introduced by M. Claes, probably from North Braxil, and flowered in the establishment: L'Horticaltare Internationale, Brasels, in 1893.

\section*{Forestry.}

\section*{TEE EDUCATION OF THE FORESTER.}

ANY kind-hearted foreigner visiting this country and chancing to rad an account of Mr, W. H. Long's reception of the forentry deputation in Edinbargh recently, would probably come to the conclusion that eatate-owners throughout the country were in some need of scientific advice on forestry matters. Were he to give the first landowner he met the benefit of his aympathies on this point, it is bard to any whether the attitude of the latter would be one of astoniahmeot or of momentary conaternation at the possibility of unounpected calamities. Mutual explanations would diaclose a fact which enthusisats on this question would do well to realise, via, that the great mojority of British woods owe their exintence to the game they harboar, and not to the timber they grow, or are capable of growing. There will, of course, be nothing novel in this atatement to thone who ponsens the slighteat acquaintance with the management of British eataten. Bat many seem to imagine that this state of thinge will one day be altered, and British forestry attain to the position it holds on the Continent. Estate proprietorn, we are told, take little intereat in the economic side of wood management owing to the deplorable lack of technical knowledge on the part of their foresters. The latter are very good men in their way, ay they, with intelligent ideas as to the practical part of their work, batare aadly deficient in (and bere our patron almont break down) acientific knowledge. "Jock ne'er did much gude at the achule," mid an old Scotch farmer to a
lawyer to" whom he wished to article his son, "and ye'll find him an awfu' bear." "Send him along, Mr. Brown, end him along," was the legal gentleman's reply. Substitute practical work for fiction, and estate proprietors are pretty much of the lawyer's opinion when engaging foresterm, not because the parely practical man is more capable than one with a technical training, but because the practical experience is wanted, while the other is not. There are few eatates in England on which the woods are expected to yield more than suffices for their maintenance as game preserves, and any surplus above this can form but an insignificant proportion of the revenues of a large entate. Any increase of this aurplas gained by skilful management can only be a slow buniness at the best, and at the prewent day, proprietors are generally well atiafied if they leave their estaten in as good condition an they found them; under thene circumstances, it is rather difficult to wee where the anaerted or supposed demand for scientific foresters exista Those who do want them are apparently under the impreanion that advertiaing does not pay, for they never exprean their need through that medium, and thone foresters who have had a little training in that line would do well to take the hint. For the present, at any rate, it is one of those talents which thrive bent under a bushel, leaving the dark waters of practical forestry to be illumined by those distinguished amateurs who are always eager to teach the practical man the elements of his calling. The latter may derive occaaional scraps of comfort from visions of a promised land, where the rabbits cease from nibbling and the pheasants make no nent; but he should never forget that he is atill in the desert, with no immediate prospect of getting out. When entate-owners want highly-trained foresters, they will neither hesitate to may so, nor gradge the expense of keeping them. Until they do these thinge, however, the young forenter would be wise not to indulge in dream which have little pronpect of realization. Let him get as mach technical knowledge as he can, but he mast not expect to find a market for it at the outset. Sach knowledge chould be regarded as a reserve fand, and not a a working capital, otherwise he may find a difficulty in disposing of his wares. The disinterested friends of both estateowner and forester may feel proud of a well-finished protege, but the latter will find that certificates and diplomas will not be accepted at subatitute for experience in the rough field of practical work. When an appointment has been secared, and he attempte to put his acientific ideas into practice, he may find obataclem in the way that he little suspected, and be compelled to tread in the empirical footstep of his predecessor after all. Until eatate-owners regard their wood. in the same light an their home-farm or their kitchen gardens, they are scarcely likely to call in mcientific aid in the management of them, or in other werds, to pay for an article they do not want. Properly-managed woods undoubtedly add to the value of an entate, but they neither necensarily enrich thone who are responsible for their improvement, nor fall in with their individual tastes and fencien regarding game-preaerve management. Until they do ao, their syatematic treatment remains little short of imponible, and the technical training of foreaters pure and simple an unnecessary proceeding. Every now and then we may come across an eatate, the owner of which is buth willing and anxious to have his woods managed on econcmic principles, but at present such are in a very small minority A. C. Folbss.

\section*{variorum.}

The Ben Davis Apple. - This is what a farmer from Stenbed County remarks in the Kansas Farmer abcat Ben Davis Apple, after seeing the wonderful orchard. of Cley County. The fruit of this variets is evidently peculiar for*", it "lack o flavour, and it appeare to be largelylin demand by
planter: in aome parts of the States:-"The Ben Davia ain't an eater. It's a cooker, and its crop never fails. And the Ben Davis never rots. Bruise any conventional Apple, and that settle it. The braise tarn to rot, and the rot takes hold of all the rest of the Apple. The Ben Davis doesn't put up with any such nonsense. Bruise it if you want to, but that bruise will simply dry up, and that's the end of it. The reat of the Apple will stay just as round as ever. And the Ben Davis never freezes. Or, if it should freezs it don't mind it. Freezing doesn't affect it in the least. It is just as solid after it is cooked a it was before; it never falls to pieces under cooking, whether whole, halved, or quartered. Then, having no trace of flavour of its own, it readily take any other flavour and becomes a novelty to the housewife and the fruit canner. Imagine having a big, whole Apple placed before you, and, when you tante it, finding that its flavour is that of the mont luacious Peach, or juicy Pear, or Apricot, or Orange or anything elee the hostess has seen fit to make it That's where the queer Ben Davis Apple comes out atrong and metaphorically knocks the socks off all other Apples on the Egypt Apple belt. Chicago and the South and West are dead stuck on this Apple and it genus, and buy it at any price. It will keep sound from one picking season to the next.

POT VINE8. - Sapposing that the vinery has been put into thorough order for the meason, and everything is in readiness, a atart should be made forthwith if ripe Grapes are required by the family about the end of the month of April. Before placing them in the vinery, wash the canes with warm soapnade made with soft-soap, to remove insecte or their egge that may have collected in the crevicen of the bark. Carefully remove a little of the arface-soil with a sharp-pointed stick, replacing it with fresh rich lomm, to which a prinkliag of Thomson's Vine Manure and crashed bone should be added, making it quite firm with the blunt end of a potting-stick. If the ball of moil and roots be thoroughly mointened before it in top-drensed, but little root moistare will be required by the Vines uatil they begin to grow. The planta should be arranged in auch a manner as to bring ap the pots near the trellis, and to do this it may bs necesbary to fix up a stage over the front hot-water pipes, which will also allow of fermenting-material being placed between the pots. The forcing in the early atage must be very gradual, fire-heat being ased only when the temperature of the house is likely to fall below \(50^{\circ}\). It in a great amintance in inducing Vine to "break" evenly, to place a bed of fermenting-duog and leaves inside the house, as it not only given off a genial warmth, but charges the air of the vinery with ammoniscal rapour, The canes ahould be bent down in such a manner as to check the flow of sap to the terminal bude, if once these get a start in growth, the back badsmay remsin in great part dormant; it it therefore very necessary to watch the development of the buds, and to take means to ensure the whole of them "breaking" at the wame time. The house should be kept shut up generslly, giving a little ventilation only at midday. The canes may be ayringed twice a day, and if a night temperature of the house can be kept from falling below \(50^{\circ}\) with the use of the hot-water pipes, 10 much the better, for at least ten day. or thereabouts.

EARLY PEACHE8.-The earlient of the pot-treea which have been prepared some time before they shed their foliage by top-dreasing, \&c., may now be brought ander cover. More care will be found necesary with these plants than with Vine during the early mages, an any great degree of excitement often caase the bud to drop wholenale. To guard againat this evil, flactastions of temperature must be carefully avoided, and the treen should not lack water it the roots. The treen should be syringed twice daily, and the house kept humid by damping the pathw, walke, \&cc. Draught should be guarded against by affording air only a the top of the houses ; and sunheat utilised an much as possible, closing the house early in the afternoon. When fire-heat has to be applied, it should be of
a very moderate degree for a time, only an mach a will keep the temperature from descending lowe than \(45^{\circ}\) during cold weather during the firut fort night. The time apparently lost at the firat can be made up withoat injury accruing to the trees by forcing harder when the day get longer, and then is more sunlight.

By W. Pope, Gardener. Highchere Castio, Nabomeration
PLANTING FRUIT TREE8.- Planting opebbe cole should now be proceeded with in favery enough dition of the land, and when it is bootn or sloe tread upon without aticking to the hond, and mis In planting have some turfy lomm at hand dariof a barrowload or two in about the rook darid
planting of wall or other choice fruit trees. Nothing that can be given to the tree is so potent in the pro duction of roote as maiden loam ; and if it be denirable or necessary to shift the plants, the operation may now be done with the minimam of injury. Ualess the oil is naturally of a calcareons nature planter and mortar-rabble will be very beneficial if added to the soil in which stone-fraits are to be grown. If the frait trees were ordered in good time from the nareeryman, they should now be coming to hand. When a bundle of trees arriven, it should be unpacked and laid-in singly, never in bandles, till they can be planted. If the stations are not prepared for them, lose no time in getting them in readiness for the reception of the treen. Directions have been given in previona Calendars in regard to planting, so that nothing further needs to be said here on this matter Mulch at once with mome rather light strawy manure After the planting is finished, see that the nursery labela are replaced by others of a more permanent kind. Newly-planted wall-trees must not be nailed or otherwise fastened in position till the apring, when the ground will have settled aufficiently, but a few loose ties may be given them. Buah-fruite may now be planted on well-manured and trenched ground. Buahes of Gooseberries, and black and red Carrants, may atand at 5 feet apart; and white Carrants, not being strong growers, may atand at 4 feet. After planting, afford a thick malching of spent-manure. The space between the newlyplanted busher may be profitably utilised by early Potator, alading, Violets, \&Ec, for two or three years, without detriment to the fruit-bushes.

\section*{THE ORCHID HOUSEs.}

By W. H. Wimek, Orehid Grower, Burford, Dorkimg.
hints on treatment.-November is generally coneidered the period at which the winter trentment of Orchid plants should commence. For the next three or four month vigilance will be required on the part of the cultivator in maintaining a regular temperature in the hounes, in avoiding as far as possible sudden fluctuations, and preserving the bilance between the degree of warmth and the required amount of moisture. These are important matters which, owing to our changeable weather, are difficult of accomplishment at times. From the present time for the next few month to come the heating apparatus will have to afford most of the warmth in the various housen, and should be carefully made use of, an excess of fire-heat frequently being the cause of the deterioration of the plants. The injurious effects of much artificial heat being used should be as far as ponsible counterbalanced by the admiasion of fresh air and the ane of water in damping the pathe, \&cc, and thus moderate the otherwise too dry air of the housen. It in aloo good practice daring spelle of front to cover the houses with canvas, mate, \&cc. Archangel mata are cheap and convenient stuff, the ends of which may be neatly tied, and meveral mata sown together in different lengths, as required along the lower part of the roof, the coldeat part of a glase-house, putting them on at duak and taking them off at daybreak. As a afeguard, thene coveringe should be made necure in some manner, and when wet or frozen, they ahould be thoroughly dried before aning them again. The night temperatare of the house should, for the present, range as follows -Eaat India-house, \(60^{\circ}\) to \(65^{\circ}\); Cattleya-house, \(55^{\circ}\) to \(60^{\circ}\); Mexican and intermediate-honse, about \(55^{\circ}\), and the Odontoglomum-house, about \(5 \mathrm{~J}^{\circ}\) to \(55^{\circ}\), the higher degree of warmth being afforded only when the air outaide is mild ; the lower degree being adhered to when there is frost, or the wind is very cold and piercing. The day temperatare, as maintained by fire-heat, shoald range between and up to the higher figuren indicated; and on light. bright daya, as much higher al the sun-heat will raise it, with the ventilators open to some extent. In ventilating the houses in cold weather, the openings at the top of the house should be opened slightly, there boing then less risk of the plants getting chilled. Oqing to the recent heary rainfall, the need for damping-down has been less during the day, nor will there be any reason to do so to any great extent anless frosty weather compels the ane of a great degree of fire-heat. A moderate damping down morning and evening will suffice for the East Indian divition, and a good damping in the morning will snffice for the Cattleya, Mexican, and inter-mediate-houses, merely aprinkling the floorn in these
houses in the afternoon. In the cool-house, where little or no fire-heat is at present need, except, perhaps, at night, one good damping-down in the morning will auffice for dull days, bat eprinkling the pathe after a sanny day. At this time of year it is very necessary that each house should become dry about noon, and the failure to insiat on this simple precaution is sare to be followed by ill-matured growthe, "spot," and other maladien.

\section*{PLANTS UNDER GLASs.}

\section*{By W. H. 8mith, Gardener, Went Dean Park, Chechater.}

\section*{THE ROBE-HOUBE.-The present is a good time} to prune the plante and thoronghly cleanes them and the house. To do this the more effectually, the former should be taken down from the trellises, which will allow of a cleaning of the roof with hot suapsuds. In pruning remuve entirely all the weak shouts, and whorten back those which are strong, pruning each variety so as to suit its peculiar mode of prowth and flowering. When the trellis and pillar Rosen have been fastened again in their places, a good ayringing with asp-sud contaning one wineglaseful of petroleum to 4 gallons of the ada, at a temperature of \(90^{\circ}\) should be afforded. The cruat of the beds and borders should then be removed to the depth of 3 to 4 inches, and a top-dreasing afforded of rich frest loam and bone-menl. Any loses that may be in an unastiofactory condition thould have their roots examined, and if the soil be impoverished or soured, fresh soil should be pricked out carefally and replaced with new, apreading the root carefully through it, and making all quite firm about them Any required planting thould now be carried out, taking care that the Rose plante are vigorous and healthy. Potted H.P.'B intended for forcing may now be pruned, that is thin out the weak thoote and ahorten atrong onen to one-half and one-third their length. Examine the draiasge, and if it be faulty put it right, and afford a top-dreating of rich loam, well ramming it into the pots. Rusea for increasing the atock of pot plant may be potted up forthwith, selecting for thi parpose either home-grown or nursery planta. Whether worked or own-root 1 l , sen, no harm will be done by shortening back some of the atronger roots, aa by so doing many fine feeding roote will be induced to puoh. The size of pot found asefal is the 32 , bat the plant should not be crammed in pote much too emall to hold the roota. The pottiogstick should alwayn be used in potting Roses, and for this reason, the soil must not be very damp, or it will have its texture poiled. If the lom is inclined to be clayey, use rough manure and a little coarse sand.
the conbervatory. - Introduce fresh plante as thes come into flower, and remove atale ones so that the honse may be kept bright-looking. If the house be not kept at a low temperature, planta of Poineettia palcherrima may be aued to brigbten it, also some Roman Hyacintha, Mignonette, B Juvardiae, Richardiar, Cypripedium insigue, Primalas, and the winter-flowering Begonisa John Heal and Gloire de Lorraine. When arranging the planta in this bouse, overcrowing should be carefully avoided, as owing to the lack of light they auffer, loning leave and damping off. As foils to the flowere, employ such fine foliage plants an Grevillea robuta, Acacia lophantha, Chamxrops excelsa, C. hamilis, Kentia Fosteriana, K australis, Aralia sieboldi, Casuarina ericoiden, \&c. The temperature in a hnuse of this kind shoald now be at \(60^{\circ}\) by day, and \(55^{\circ}\) by night, affording both top and bottom ventilation in moderate amount. The floors should be kept dry, and spilled water or that which rans from the pots, thould be mopped up early in the day. When the flowera of the Chryanthemum begin to fade, remove the planta and cat down the stema, placing the planta in a light, airy house to atrengthen the shoots before beginning to propagate from them next month. Nur these plant are in flower, toe that they are correctly named.
michardias.-Should the e plants be in demand at the end of December, planta man now be placed in a warmer hoase, if from appearaces it it surmised that they will not flower by that time. A vinery or Peach-house just atarted affords a suitable place for hastening the opening of the apather. If roots are plentiful, the plants may have rather liberal doses of manure-water, and occarionally fomigate them to kill aphis.

ZONAL PELARQONIUM8. - Tbe hot nummer wan well suited to the needs of these plantis, and they are in consequence flowering admirably. Whilat they
continue in bloom the air of the boeve abould be kept rather dey; and a mean to eecare the desirable dryneas, a alight amount of fire-heat should be used, and fresh sir admitted at the cop and bottom of the house. The mecessary watering of the plants should take place in the morning, and if the plant are in fall bloom, clear water caly aboald be used.

\section*{THE EITOBTIN GAKDKD}

\section*{By Jonm Lamergt, Gandener, Pown Cuetie, Welahpooh.}

CHICORY. - Keep ap a supply of this ueeful plent for malad parpones. Place the roots is large pots and put in the Mushroom-hou*e. Here they will not require any covering, and the atmospere just saiting them. By putting in a good-sized potful each week, a continuous sapply may be had the winter through. Where a Muahroom-hoase is not to be had, Chicory sany be pios. into any house with temperature of about \(1 \omega^{\circ}\), covering them ap by placing an inverted ampty pot over them, and over this a piece of Frigi Domo to exclude all light from them.

DANDELION. - The large Firench leaved of thin variety if grown in rows and created similarly to Chicory, make nice roots for lifting and atoring ready for use through the winter, and are a nice wholesome addition to a salad. These may be treated in precisely the same way as Chicory; or if preferred in a green atabe, any warm greenhouse will suit them.

MUBTARU AND CAEB8.-Make nowinge of this regularly every week, so that anpply of nice young, tender growtha may be alwaya at hand. Catting boxes are favourites for this parpone, and can be easily pushed on in a warmer house if upply is not equal to demand at all timer.

RADI8HE . - Sowing of these may be made from now onwards, to follow on alter those from outaide are finished. I'ste filled with beating material, on which may be placed about is inches of soil, having the surface within 1 foot of the roof-glase, make nice placen for growing thene, and if one hot-water-pher runs through the pit, so much the better to keap the atmosphere at the right temperature of about \(50^{\circ}\) These, If nown among other crops, anch as Potatos, are often neglected.

MINT AND TARRAGON - Get up a mupply for the winter of these ruote, and pot them, or put them into cutting-boxen and atore them away in a cool pit where they will alway be accemible in the coldeat of weather. Introduce these into a moist heat of about \(55^{\circ}\), but near the roof-glass, no that they shall not get drawa up weakly.

RHUBARB.-Although Apples are pleatiful this season, Khuharb is many places is welcomed at a change. Young roots prepared on purpow for forcing, and which have attained their fourth year, will be of a nice aize, and may be lifted from now onwarde end introduced to the Mathroom or forcing-house, for very early work lifting and placing in a forciag-houte will be the handient through very severe weather. If a fow roots are introduced about every three week, a continuou supply may be obtained; but where this accommodation in nut pro vided, various meane may be adopsed to attain tho ame end. Pita filled with warm manure, alac shallow pite dug in the ground and filled whth abous 3 feet of manare, prepared so that a gentle heat will br maintained for a long time, and covering the top with hoopa, matn, and then long litter-but these depend on the outside temperature to a great extent, and cannot be relied on to come ia to a certain date as all times. The old plan of covering this with pots and flling around and above them with hot manare on the ground where growing, I think, producen som of the best yet grown, and is more amitable for later batches; but this is bent grown in some out-ofaight part of the garden, and sear to the manureheapr. Johnston's St. Martin*, Kerahaw's Paragon, Royal Albort, and Myatt's Linnseas, are all goot varistien for this parpote.

Ma. William Coomber.-We are informbi that the Council of the Royal Botanic Society has decided to dirpease with the services of a garden saperintendent of their garden in Ragent Pafk; and Mr. Coomber, who tha filled the post for many years, will therefore bo open to a reangagement
appointments for the ensuing week.

\section*{SALES.}

Dutch Bulbs at Protheroe a Morris' \({ }_{\text {Rooms. }}\)
Roses, Hardy Bulbs, and Plants. Ferns, \&c., at Protheroe \& Morris'
MONDAY,
Nov. 18 Rooms.
Highly attractive and extensive sale of Nursery Stock at the Alma Nurseries, Faraham, by order of Mr. S. Bide, by
TUESDAY, Nov. \(19\left\{\begin{array}{l}\text { Dutch Bulbe at Protheroe \& Morris' } \\ \text { Rooms }\end{array}\right.\) What \(\left\{\begin{array}{l}\text { Dutch Bulbs at Protheroe \& Morris } \\ \text { Rooms. } \\ \text { Great Consignment of Japanese }\end{array} \quad\right.\) What is Natural The expression natural selection can hardly be considered to be as felicitous as it is familiar. The phrase must be taken in an arbitrary or metaphorioal, rather than in a literal sense. Given a tendency in plants or animals to vary, the variations which harmonise best with the conditions ander which the plant is growing may become permanent, and may even become acoentuated, so that from the originally slight variation the full-blown speeies may ultimately arise. Under natural oiroumstances, the growth and development of s species is a very slow process; but the gardener does, in comparatively short time, the same sort of work which in Nature ocoupies ages in its aocomplishment. The hybridist and gardener do actually select that variation which suits their parpose, and they continue to do so from generation to generation till the variation beoomes "fized." The variation is encouraged and protected, just as in ordinary oultivation the plant is freed from the competition of rivals, and proteoted from the intrusion and assaults of enemies.

The term adaptation is more exprensive of what really happens in these oases than is selection. But the question arises as to the origin and cause of the adaptation. Does the protoplasm of the plant or animal, or, let us say briefly, does the plant adapt itself to outward oonditions, or do the outward oonditions compel the plant to adapt itself to them or to suffer extinotion? In other words, does the power or faculty of variation preoede the ation of the conditions, or is it generated or oalled into operation by the influenoe of thone oonditions? These are the questions whioh the Rev. Gronger Hemblow has net himself to answer. In a very interesting and suggestive volume he states the oase clearly, and as it is one on whioh caltivators should have valuable information to offer, it is desirable to bring the book * under the notioe of our readers. Mr. Henslow's volume is one sustained argument, but it is illustrated by so many points in which botanists and cultivators take speoial interest, that it will be perosed by them with pleasure.

Mr. Hewslow's oontention is that a change of ciroumstances-or, as he oalls it, a "new envi-ronment"-does not "meleot" at all, but itself induces a plant to form variations. Theer varia-

\footnotetext{
-The Origin of Plant Structurea, by Self-Adaptation to the Enviromment. By Rev. Gromar bemslow, ku. (Kzaan paul, Tremoh, Trubaita Co.j
}
tions are definite, and not indefinite-s definite variation being one having a definite relation to the action of the environment in the way of effeet to cause.
It is pretty certain that there is no true selection; in any case, the word must be aned metaphorioally only, and this being so, it becomes a question whether there is in reality suoh a groas differenoe between Mr. Henslow's viewr and those of other people. Whichever view be tancen, the power to vary and the faculty of adsptos. tion to oiroumstances are the necessary factom, It is the order or sequenoe of events conoerning which differenoes arise. Mr. Hension maintains that the protoplasm varies in sympathy with, and as a direot consequenoo of tho action of external oonditions. The protoplim, therefore, must have an innate capuity of varying, which results in variations of stromure. These variations in structure are the poteraisal beginnings of a new speoies, so that, in \(\mathbb{M r}\). Henslow's words, "the origin of speoies imnee ont of the direat aotion of the environment through the responsiveness of protoplasm in the organime itself." It is not, acoording to Mr. Hrnsion,the fieroe competition and struggle to whioh plants are subjeot which enables the survivors to adiph themselves to new conditions, bat the direot aotion of those conditions. In support of his contention, the desert plants in the vioinity of Cairo are mentioned. These ocour in quantitie, but are never so crowded that any struggie or rivalry occurs between plant and plant, the real contest being between the plant and the physion diffioulties offered by soil and olimate. But me may ask-Do desert plants never vary? Our author seems to be of opinion that they do not, so long as the same environm \(n \mathrm{nt}\) is maintained, and no doubt, as a general rule, that is 80. But how is it, if the variability does not prop oede the action of external conditions, that the gardener is able to seleot minate variations among plants growing, as far as oan be seen, under the same oonditions. Again, if variations do not occur "spontaneonsly," how are weto account for the production of "sports?" Thee often ocour simultaneously over wido arem, ander the same conditions as those to whiot the bulk of the plants, whioh do not vary, are subjeat. These sports are mostly accidental revere: sions or un-mixings of beretofore blended characters, but what brings about the ohange a partioular time is not known. That it oannot be direct action of the environment is, we think shown by the facts just mentioned.
Mr. Hunslow's argoments for the elifedap tion of plants as the initial stage in the production of speoies are supported by a vast number of facts, derived from the atudy of the outer oonformation and internal organiastion of platite In this way, the struoture peouliar to platid growing in desert regions or on the seam-ooust, if the arotio regions, or on mountain-topt, passed in review. Aquatio plants, olimbiog plants, and other plant categories are prema into the service. In addition to the foots of tained by observation, Mr. Henslow bring forward oorroborative evidenoe in the shape experiments. Apart from the use made of tha in by the author in support of his arguments, it very convenient to have suoh a mass of inforte tion got together, and so conveniently arrabge whilgt the care which Mr. Henslow hes tasel to give ohapter and verse for his statements, thas to enable others to verify his referencomer deserving of ample acknowledgment. A the inder further facilitates the work of the stodean of to whom we cordially recommend the perae this most suggestive book.

Begonia Mrb, J. Heal. - To nuccenafully bridge over the interval between the ond of the flowering menaon of the tuberous-rooted nummer Begonias and that of the true winter-flowering specien, was folt by gardener to be a most denirable feat, and one that remained for a long time an-

Adonis, and now we have one of their lateat novelties, Mri. J. Heal, producing crimson bloseoms. A plant was shown by Mesers, Veitce at the Royal Horticultural Society's meeting on October 15 of the present year. The bloseomschielly male, fortunately-menare 2 to 3 inches in

Listem, Bart, be elected President, in the room of Lord Kelvin, who retires.

LImNEAN Society.-At the metting held on Thureday, November 7, Mr. C. B. Clater, President, in the chair, Mr. Gyonor Massin wat admicted

Fig. 101.-bRGONIA \(\times\) yRA. HRAC: FLOWRES CRIMFON.
accompliahed. The credit of having obtained the firato of the late-flowering new varieties belonge to Mesert. J.Veitch \& Sons, Chelsea, who by crosning B. socotrana with some of the Istf-flowering Andean taberoun-rooted Begoniss, Isid the foundation for future development. One of the earlient crome: Wat John Heal with bright rose carmine flowers appearing in a loone raceme. This variety by other cronning with tuberous-rooted parietien gave
diameter, and are chiefly produced in the axils of the leaves. It is one of a race of Begonias, which is likely to be in conaiderable demand for brightening the warm greenhouse, and furnithing ubject for indoor decoration during late antumn and winter.

THE ROYAL SOCIETY, - The anniverwary meeting of thi Society will be held on the soth ivato, when it is proposed that Sir Josmpre
a Fellow. Several volume of Crjptogamic exticcata, recently received from Madame Wendril, as a bequest from her late huband, a foreigu member of the Society, were hown, and some remarks made thereon by the Botanical Secretary. A portrait of the French nataralist, Guillaume Rondelet, Prof. of Anatomy and Chancellor of the Univernity of Montpellier, \(\mathbf{1 5 4 5}\), recently presented to the Society by Dr, H. Woodward, F.R.S., wat exhibited by the Zoolo-
gical Secretary, who gave an account of hin life and work, aupplemented by remarks from the President. Mr. C. T. Deurry exhibited and made remarks on a Scolopendrium rained by Mr. E. J. Lowe, bearing archegonia and antheridia upon the fronde, constituting a more advanced phase of aponpory than any previoualy noted. Some remarks thereon were made by Mr. Geo. Murrax. Dr. Maxwbll T. Masters exhibited specimens of the fruit of Pyrus Sorbus, Aberia caffra, and Cocos australis, from the gardens of Mr. Thomas Hanbury, at La Mortola, Mentone; and some fruits of Cocos australis, from M. C. Natdin's garden at Antibes, Alper Maritimes. Mr. G. F. Scott Elliot commanicated a paper entitled "A Revision of the Genus Pentas," in which some account was given of the distribution of these plants in Africa, with a rectification of the aynonomy, and deacriptions of five new species. The genus as a whole showed in a remakable manner the way in which local npecien occur whenever a different climate rentricta the dietribation of a wide-ranging form, and several examples of this were mentioned. A discassion followed, in which the President and Mr. W. P. Hiern took part.

An evening meeting will be held on Tharaday, November 21,1895 , at 8 p.ar, when papert will be read: 1, D. Mobris, C.M.G., M.A., \&ce., "Development of a single seed in the fruit of the Cocoanut Palm (Cocos nucifera);" 2, A. J. Ewart, "Assimilation in plants under abnormal conditions;" 3, A. C. Seward, "On a new apecien of Pinites from Wealden (England)."

The Chiswick Gardens.-We are officially informed that the Council of the Royal Horticultural Society have appointed Mr. S. T. Wright, of Glewaton Court Gardens, Ross, Herefordehire, to aucceed Mr. Barron, an Garden Saperintendent at Chiswick. It will be remembered that Mr. Whigit was the author of one of the Society's prize eanays on "The Commercial Aspecte of Hardy Fruit Calture in the United Kingdom."

Beckenham Horticultural Society.-Oa Friday evening, Mr. Edwin Molyneux delivered a lectare, entitled "Salient Point in Chryanthemam Calture," before the membern of the Beckenham Horticultaral Society in the Beckenham Pablic Hall. Over 300 were present, and the greatent intereat was shown in the nubject. Some fine exhibits by Mearr. Cannell, the Bromley Chrysanthemum Society, and by a large number of private growera, made the room look gay, and rendered the antject additionally interesting.

Aybahire Gardeners' Mutual improvement Absociation.-The firat meeting of the fifth sension of this ansociation was held in the Carrick Street Hall on Thuraday evening. There was a fair attendance of mewbers present. Mr. H. Maxwill, The Knowe, Vice-prenident, presided. The President (Mr. A. Pbingle, Middleton) read an excellent paper entitled "A Few Noter on the Dahlia," for which he was accorded a vote of thanke. Mr. M. Gante, Glendoon, exhibited a magnificent Cypripedium insigne, for which he was unanimously awarded \& Certificate of Merit. It way intimated that the next meeting would take place on Thuraday evening, 5th December, at 7.30. A vote of thank to the chairman brought the meeting to a close.

Royal Botanic Society.-At a meeting of the Fellows of this society, held in the maseam of the Royal Botanic Gardena, Regent's Park, on Saturday, Major J. W. M. Corron preniding, Mr. C. Dusigll Rudd was elected a Fellow. The Coffee trees growing in the greenhouses having frnited well this year, the necretary tried the experiment of roasting and grinding the aeede and making coffee. The beverage was offered to the Fellows at the meeting, and a very favourable verdict way pasaed apon it. The society's show of Chrynanthemums was announced to bo held this week. It was also stated that in future the gardens and concervatories would be open to the public on Mondayn and Satar-
dayn throughont the year upon payment of 18 . for admianion. The receipt of the following donations was reported:-Seeds of the very scarce plant, the large-leaved variety of Coca (Erythroxylon), from South America, and a fine cone of the edible Chili Pine (Arancaria imbricata) from the gardens of Sir Gabriel Goldney at Coraham, Wilta. A curioua Tapioca root (Manihot utilissima), grown in the society's gardens, was also on view.

Stock-taking: Осtober.-Ai was antioipated, the tide of commerce is still a flowing one, and the loss in both imports and exports during the preceding months of the year has been wiped off by the increase in both sections-resulting in a gain, last month, of \(£ 1,185,783\) in imports, and \(£ 1,680.870\) in exports ; all this, be it remembertd, in the face of the breaking up of the Saltan's empire, and a consequent paralysie in trade in Asia Minor, due to the dinappearance of Armenian merchants, either by the aword, or by the flight of the merchants from a land overflowing with horror. The value of our imports in October of last year was £35,668,385; that for the month just ended was \(£ 36,854,168\). The increase for the ten montha just cloned, compared with the same term last year, is exactly \(£ 478,489\). The following item of importa for the month are from the Trade and Navigation Returns for October:-
\begin{tabular}{|c|c|c|c|}

There is an unsatisfactory item in the recorded increased import of manufactured goods, as to a considerable part this means a withdrawal of manufactures to places where lens wages are paid-to France for instance; where, whilat the cost of living has increased all over the country, the price paid for labour han also gone down-a double result of Protection. Fortanately, this in being recognised amonget thinking men over the Channel, iast as it is by nome American statermen-the Hon. Mr. Bayard from Washington having jant delivered himself at Edinburgh, of the statement that protection produces jobbers and jobbery, notatatesmen and purity of morale. Oar hop-growing friende, if not the brewers, will be glad to learn that the imports of Hops last month fell off some \(£ 70,016\) in value, as compared with October, 1894; ponsibly our Continental friends, finding freights so low in Eaglish ships, are taking to making their own beer, and shipping it off to other lands. And here we are reminded of one of thone aavage attempte to aettle trade differencesthe lock-out and atrike in the shipbailding trade in Belfast and on the Clyde. Pomaibly a decision to nettle by arbitration will have been arrived at ere this. A to fruit and vegetable imports, we take out the following figures :-

The "minus" quantities recorded toll their om tale, and there appeara little doubt of the detemen influence on colonial imports exercied by our hat fruit harvest; what influence also the late aboromid weather may have on both home-grown and forieg fruits remains to be seen (perhaps hae already bean). It is pleasant to notice the intereat being taken in . light railways by the Prenident of the Board of Tnde and nome of his colleagues; in Franee they my have seen much in the matter of motore to methem thinking. The nabject of

\section*{Exports}
is certainly one more interenting than ruan jut now. The rapid expansion of enterprise in our colonien is being felt more and more by our manfacturera, and those employed by them. To our American friends, textile manafactures canno bo aupplied quickly enough, and they in turn are getting better money for their raw material. Doablen Irwo Trade is being more and more appreciated ores thero as the month go by. The value of our export in October, 1894, was \(£ 19,147,996\); the figures for lat month are \(£ 20,828,866\), or a gain of \(£ 1,680,80\); the gain for the past ten montha over the same priod laat year being no lean than \(£ 6,888,736\). The attention of all the "protected" world is repper fully requeated to this brief record, and to the im. proving condition of our productive energg. Shald the three great powers quickly and quietly seltid tho Tarkish business in both Earope and Asia Nlinorthey ars big and powerful enough to do so-an rea brighter tone may characterine the record of the exports for the carrent month.

Rust in Begonias.-Cultivatora have for laes been pestered with this dieease, the precive untur of which has not been known till recently, wh Micease, the authority on the Acarine, informu that the disease is caused by a mite, a ppecian of Tarsonymun, which is so small and so tranuluend that it requires a trained eye to detect it. It halid of life also tend to conceal it. The crostaram mont destructive to healthy planth, burronis between the two aurfaces of the leaf, and eatiry oub its substance. A closely-allied species, T , buis few years ago destroyed all the Box treen in mex of the Italian botanic gardens. The Sugar.curain Barbados also anfered greatly from a similar ine (sea Kew Bulletin, April, 1890). Theg aso mow difficult to destroy, but frequent apraying with int ticides may be beneficial, and in our lat iunt yin Watson telle us that fumigation is very efifunams All badly-a ffected plants should be destroged by ulin The beat figures of Tarsonymi, Mr. Mrcausi whe us, are to be found in Cansstrint, Proppetto Acarogama Italiana, iii., Padors, 1888. t. 23; BE legee, Sotofofamiglia dei Tarsonimide Bull. Sor. Bur mol. Italo, 1886, t. xro, figs. 2 and 8, male only; wh Kramer, Ueber Dendropturs Archiv, fur Natuyday 1876, tab. viiii, figa. 9, 10, 11.

Acer Lorbergi.-A most diatinct sad hes some Maple under this name was ent to me, rew Mr.W. E. Gumbleton, of Belgrove, Qabenito give years ago by the late Lodis Vas Hoortrs, of it and being of a fine vigoroas habit of grom now developed into a fine tall apecimen, las buitiel merit, however, consiats in the specinlly in wi autumn colouring which its foliage anamer ant time of year, when every leaf becomes a clean pired yellow, making the tree an extremely chall and beautiful object in the ahrabbery, and betibit planting by every lover of distinct and in in in
foliaged trees. The name is not recogiod Index Kevenois, so that it may be knom for for some other name at Kew. I enclone a lear inion inspection, and shall be glad of your opitas of the beauty of the colouring and correctina name. [Very beautiful ; name later on. ED]

Biamingham Botanical and Ho mio TURAL SOCIETY. - We are informed by bove Hillhouse, homorary mecrehary of it is intended to hold a Daffodil (Narcinal Gand
with other spring flowerw, in the Botanical

Ejgbaston, in the month of April, 1896 (two daya nhow), at anch dase as may be deterouined by the season, of which the longest possible notice will be given to all who have intimated a desire to exbibit. A list of regalations for the guidance of exhibitors, together with a schedule of prizes, have already been drawn up, which may be obtained on application to Mr. W. B. Lathan, the Carator of the gardens.

Ealina Gardeners' Abbociation. - We underatand that Mr. W. Rubrats, gardener to J. Harris, Eaq., Braemar, Ealing, has beon appoiated Hon. Secretary to this body, one that has done-and is doing-much good by its meetings and discuasions amongst the gardeners and amateurs of Ealing and diatrict.

\section*{Home Correspondenoe.}

COVENT GARDEN PRICES FOR FRUIT AND VEGETABLES IN 1822. - It may interest your readera, amatear and profenional, to know the pricen retail that were obtained for the above seventy-three year since. Of course, we had not the facilities in thoue day we heve now-no hot-water, or cheap fuel and glase, \&c.; and it cost more to erect one 50 -feet house than one of 300 -feet could be erected in these days; but the prices, under any circumstances, appea" fabulous; for instance, 218. for a brace of Cacumber in February; 36s. for 1 lb . of Grapes in May; 30s. ditto in June. This seems to be an early as Grapes could be had, and none after November. Cherries, 30s. per pound in April ; 20s. ditto in May; Melons from 5s. to 20s. in Jane; Strawberrien, 30s. per pound in April ; 20s. ditto in May; Pine-apples, 12s. per pound mont of the year through; Fige, 18s. per dozen in August; 10s. ditto in September; Peaches, 42s. per dozen in Jaly; 21 s. ditto in August; Applen, dessert, bent, fos. per bushel in January; cooking, 18s. ; Asparagun, 21 s , per 100 in February; April, 15s. ditto; Peas, £: per half-nieve; 30s.
ditto; Seakale, \(4 s\). per pannet in March. Thia, I think, will be ufficient to how what pricen were then realised without going further into the prices of other crops. Love-apple (Tomaton), none alld, although quoted in the market all the season. It is something remarkable how the tante has grown for Tomaton daring the pat twenty years; about that time when I first began Tomato-growing on a large scale, I used to supply Mr. P. Barr with them at \(1 \frac{1}{2} d\). per pound; also Mr. Cbarles Best of the Horse Shoe Hotel in quantity at the same price; aince then, \(2 s, 6 d\), and \(3 s\). per pound have been given. Had it not been for the Tomato coming in requeat, many growers would have become bankrupt. It is this one thing that has kept them on their legs, and many have made it a source of profit; farmers and clergymen have also erected housen for Tomatogrowing for market. Edw. Beunett, Lyme, Chertsey.

REGULATION8 AT THE DRILL HALL.-Will any one kindlyssy why plante put before the Committee meetings of the Royal Horticultural Society at the Drill Hall for Certificates ahould have to be accompanied by the owner's name written on a card, and handed round for inspection, as well as the plants? A friend and I paid a few visits to these meetings daring the past summer, and we thought the method a very peculiar one. Why not enter the plant under numbers in the way that competitive exhibits are entered? Could not the plants meant for Cer tificates be numbered, and placed by themselves, before being anbmitted to the committee, instead of being, as at present, ataged among other plants already ahowing exhibitor' or owner's name? True, these plants are not intended for competition in a sense, bat is not the decision of the committee in regard to Certificatea looked apon an equal avmbolic Value to lat and 2ad prizes at a show? We also noticed if the owner of a plant was present at the committee meeting, he moved away from the table When his plant came up for judgment; but under the number system he could iurely retain his seat, and have the advantage of hearing opinions on point which may, or may not, have escaped his notice; also voting a Certificate for his plant if he wished. Visitor,

FRUITING OF MUsA CAVENDIGHI IN POTS.With reference to this matter, it would appear, from What Mr. Fletcher tate in last werk' Gardeners Chronicle, that the fraiting of Maw Cavendiahi in
pots is either new or difficult, bat our experience is that it is neither new nor difficult, having anccesafally fruited several plants in pots. We have just inished \(t w o\) good bunches of frait, estimated to weigh from 30 to 40 lb . each, " bat an the 'fingers' are gathered as they ripen on the plant, I cannot give exact weight," the eeparate fingers weighing \(6 . \frac{1}{2}\) cz.each, and the plants are grown in a No. 1 ( 18 inch) pot. Wo have at the present time aix plants at the back of a lean-to atove, four of which are in 18 -inch pote, and two in tubs. the latter being from a cask cut in two, meanaring 26 inches acrom and 19 inche in depth. The two plants in the tuba are now fruiting, having just set about nine hand each, with from fifteen to twenty-four fingers per hand. Oar mode of treatment is very simple: the noil, conaiating of turfy loam with which horso-droppinge were mixed when it wan atacked, with plenty of harp river-annd, and a liberal aprinkling of artificial manure. The plant are alway kept well up to the light, and abundance of water afforded them, giving them liquid-manure two or three times a week, from the time the pots are filled with root until the fruit is fully grown. H. Fuse, Westhourne, Lizkeard.

In your last iasue, on \(\mathrm{p}, 555\), I aee Mr . Fletcher writing of Musa Cavendinhi. I am pleaned to add we have one in fruit here; it hae been grown in a tub 23 inches in diameter by 15 inches deep; the tom is 3 feet 6 inches in height; it hae ten leaver, which average 4 feet by 22 inches. I wan disappointed in not getting a better bunch, which only contain forty "fingers," and after reading Mr. Wythen' able article on the Banana, I have been wondering I I had a good variety, or if it wat bad calture. J. Barnard.
- It in without a doubt a mintake, an Mr. Fletcher remarks in hia note on the Musa in last week's Gardeners' Chronicle, p. 555, to muppose that it cannot be fraited succeasfully in pots, an I have seen it fruited at two different places in pots, with frait equal to any produced by plants in beds. We have here at present in a \(2(0\) - inch pot, a plant carrying a large bunch of fruit, and although late in the eason, I have no doubt it will fruit perfectly. Cutting away the tip, reierred to by the Editor in his font. note, was resorted to in thi case al
Pearson, Rachan Gardens, Peblesshive.

SHARPE'S VICTOR POTATOB.-The articlen lately inserted in your columns respecting our Victor Potato are reviving rather ancient hiatory, and after the lapse of so long a time ones memory may not be so freah upon every point at it might have been some years ago. It is beyond doubt that Sharpe' Victor was raised by Mr. Richard Nisbet, Aswarhy Gardens, near here, and from the two parent Potatos au he atated, viz., an early thort-top round and the Alma Kidney. At he was well known to be an honourable truthful man, we hould accept anything he said with the most implicit confidence. The true Victor, as raised by Mr. Nisbet, is a yelluw-fleshed Potato, but a little inclined to sport into a white variety. For a few years after it was first sent out, Mr. Nisbet grew all that we sold, and it is almont certain he never heard the name of the Vale of Cleveland. As far as my memory aervea me, Mr. Short did send ut a few, probably a bag, of a Potato he had raised, a white-Henhed Kidney, rather longer than Victor, these were sent to our farm to grow, but we did not think them of any value (it might be that the meason or soil was not anitable), sad they were doubtles consumed on the farm, as we never saw them again. It in not imposnible for two independent horticalturista to make use of the same parenta in raising a new varisty of vegetable. Mr. Ninbet raised our I ake of Albany at the same time as Victor, and some years after a white Beauty of Hebron was went out, which we cannot distinguish from the Dake-no doubt this was an accidental crose between identical parente. Charles Sharpe \& Co., Ltd. (Jno. C. Gould).

Crabs ab arches - I like J. Maeers' (p. 556) ideat on the above. Barring the birde, Crabebkilfally planted and trained-woald form charming arches, alike in flower, frait, and foliage. We have long been familiar with arches of Applen, Pears, Cherrien, and Plam: but the amaller mize of the Crabs would give them an easy victory for elegance. Posibly the Quarrenden, the Golden Pippin, the Gladstone, and other high-coloured amall Apples might go with the Crabs. Here, if any further foliage in needed in Crab avenues, a few traes of Prunus Pisnardi or of the purpla Filbert will give a bronze or red hue. Beyoud Crabs, are the Acer Negundi argenteum variegatum, or the Silver Maple, so it ie called, can be trained over an arbour or arch
at readily as a Vine; the golden-leared variety of this plant in nothing like so free and ueeful. If more variety is desired, Clematit, Ampelopsis Veitchi, and tho Guld and Silver Iviea can bo so used to enrich Crabs without aeriously iojuring either their health or fruitfulnen. D. T, F.

POPULAR APPLEB. - Your correspondent, "D.T. F.," is not juatibed in bis dedactions as to the relative popalarity of certain denest Applee by the representativen of them he found at the Crvatal Palace fruit show. There were apecial clases for Rib*ton, Cox's Orange, and King of the Pippins; and theee classes alone brought to them in the order named-forty-one, forty-aine, and thirty-six dishes respectively. Golden Pippin, Golden Rusaet, and Goldea Kisinette had no anch encoaragement. So mach it is fair to aay with reapect to these excellent, but yet far too little grown varietiea. Then we had thin year one of the beat semons almost ever known for the development of Kibutons, Kinge, and Cox's, for iner, clearer amples, and better crope have rarely been seen. It is not always so with chese somewhat spoilt children of pomologista. \(A, D_{0}\)

I whould like to applement the brief list given in last inene by "D. T. F." as regards desuert varietien. Wyken Pippin, I consider good in flavour, a free doer, and a certain bearer. Court of Wick is another good Apple, beare well, hat good flavoar, and keepe late: Scarlet Nonpareil is another favourite of mine, a very aure cropper with me, juicy, and keep well into April; Kerry Pippin is another good variety, bearn well each year, the flavour good and pecaliar, and with me the tree does not canker-in fact, none of the above do here. 1 send you a fruit of eacb, and please give your opinion at to their merita. I should say, Kerry Pippin wa ripe and gatbered at the end of Auguat. I do not reckon King of of the Pippin the beat of flavour, though a good market variety. Bicton. (O) ur correapondent kindly ment a few fruit of the above-named Applen for our inspection, which quite bear out his contention, Wyken Pippin eapecially being finer than we have ever seen it; Court of Wick is also of unumal size, and good of flavour. Eid.

THE TRUTH ABOUT PRICEB.-With pleasure I answer the courteous enquiry of "D.T. F. " why Cox's Orange Pippin did not occupy a highor poaition in not paid so much from an equal number of trees on the same amount of land an those varieties named before it in the eany. The value of Cox's Orange P'ppin is certainly high, ranging, as a rale, from 30 s . and upward per cwt: Already thit year I heve diaposed of a quantity at the figure named; bat take one eason with another, the crop hat not been heavy enough with me to warrant it taking a higher place. If fally endorse the remark of "D. T, F." on Ribston I'ippin as one of the finest deasert varieties grown; but though grown both on the Paradise and free stocks, I have never yet made a profit on them. Oa p. 525, "Mid-Kent" etatem that "a glance at any market report will show the fallacy of the enayist's atatemente; " or, in other worde, that the atatement are incorrect. Probably any remark in contradiction would share the same fate as my previou atterancer, therefore I will only asy that the essay wan written early in the Aagust of the present year; but if "Mid-Kent" will write to Mr. Jobn Mills, Smithfeld Market, Manchenter, he can easily prove whether my statemente are incorrect or otherwise. Even in a season of low prices like the present one, I have had no difficulty in making 288. per cwt . for Peasgood's Nonsach in balk, and could have sold many more. I may add, that the price quoted have been made in the open market by the above salesman until this year. Since then most of the fruit has been sold on receipt of the tolegram that I despatched at the time the fruit way pat on rail, the buyers who have purchased the frait from Mr. Mill for yeara, knowing that they could depend apon the fruit being honeetly packed, and according to the wire received by Mr. Mille, and have been only too glad to bay the same before it reached the market. The Esayist. [Mr. John Mills' invoice for 'ty cef. 3 qru. 15 lb . of Apples, which our correspondent wend for our inspection, entirely bears out his contention, and it is quite correct, and in proper order. Es

THE PREBTON HALL MUBCAT GRAPEB - Y'OUR correapondent' remarks on the Muscat Vines at Prenton Hall, p. 526, how nothing that is extraordinary in the way of Grape culture. We bave, at this place, a vinery which was plantad with Mucat Vine in the month of Febrasry, 1895, that measare
on an average \(3 \frac{1}{4}\) inches in circumference 5 feet from the ground. These Vines were cut back after planting. and the measurement is that of the young canea. A. Young, Marston Gardens, Frome.

PACKING COMPETITION AT THE CRYBTAL PALACE.-Possbly not intending it, your correapondent, "One of the Judges," confirms the contention of Mr. F. Harris for the need of revision in regulations governing these competitions. Take fow first point, the qualification of the judgee. A few years since, when Messra. Webber \& Co. provided ypecial packing prizes, a leading authority (a gardener) advocated and used boxes for Grapes. Beirg myself at the time just introducing the syatem of basket packing, now generally used, and determined to give the box system a trial, and send up to a Covent Garden firm two boxer packed as advocated. When received, my ale-note was endorsed "Grapes arrived in good condition, but if in baskets, would have realieed 20 per cent. more; best buyers now refuse to look at box Grapea." Now, as to packing material, on advice from a leading firm, I adopted dry mone for Peachev, \&c. : and with me the halfyearly mos barvent comes as regular as a farmer's annual hay barvest. After reading your correapondent's letter, I made inquiry of aleamen as to any better material being now available, I have a reply saying they still prefer dry mons before anything else; the fruit travel well, and
does not heat. The wood-wool often used does not heat. The wood - wool often ins in the fruit in liable to apeck. On these two instance I maintain with Mr. Harris, gardeners are not the mont avitable jadges of packing competitions, particularly when for market The system adopted for Apples by the donor of tre apecial prize is very anitable for ample asles, or choiceat mpecimens, but in my opinion is not adapter for bulk. The regulation governing diatances would bedifficult, but might be made more \& qual, ay all fruit
had to past through a London main. line atation a had to pass through a London main- line atation a:
Paddington, Charing Cross, \&c. On diequalifyine. your correspondent is rather free. Instead of disqualilying boxes tied, the jadges would bave dune better to eall an official and request the boxes to be placed in proper classes. Being connigned to the Secretary as requented, it became his duty to see tha pach one was in it proper place, no regulation statir, the judge more happy over the other poanible diequalification, not supplying items of cost, \& \& \(c_{0}\), as in but une class is this imperative; in the other three it is quite optional, an I read the achedulp. I am aware cuch mattess were to be taken in consideration who \(n\) judging, but bting easily-inspected packages, claded that the jadges were men of anfficient con petence to estimate these. Will your correspondrnt tell us if all packages he inspected were first examiner for railway parcela label, and found each to bave ote attached? Rcbt. Grindrod.

\section*{SOCIETIES.}

\section*{ROYAL HORTICULTUBAL.}

November 12.-Chrysanthemums were again a prominent feature at the meeting of the Society held on Tuesday last, in the Drill Hall at Westmineter, and many novelties were submitted for n.p-ition by the Floral Committee. Orchids were shown in ordinary quantity, and there was a fair amount of fruit before the Committee for this ection.

\section*{Floral Committee.}

Pretent:-W. Marshall, Esq., in the Chair; and Mesars. J. Fraser, O. Thomas, H. Herbst, R. Dean, G. Stevens, E. Mawley, J. D. Pawle, C. E. Shea, H. H. D'Ombrain, J. Walker, H. Cannell, H Turner, C. T. Druery, C. Paul, H. Selfe-Leonard, W. Bain, C. Jeffries, C. E. Pearson. and H. Briscoe-Ironside.
Sir T. Lawrewce, Bt., Burford, Dorking, gr. Mr. Bain, showed a few plants in flower of Pentstemon Cobæa, a halfhardy perennial species so named from its Cobeea-like flowers. The spikes were upwards of two feet high, flowers pale lilac in colour with purple streake in the corolls. The plant has beon known long in gardens, but is not wildely cultivated. It is fagured in Bot. Mag., to 46\%. (Award of Mertl.
Mr. O. Otharaiv, Esq., River Home, Kemptun Court (gr., Mr. C. Last, was awarded a First-clams Certificate for which were exhibited ta fine condition. The thick leave of this plant are nearly if finches wide, and tho thick leaver of shown were about 2 foet mod hall long, daris groen in
colour, and suitable apparently for sub-tropical bedding, a well as for other purposes. An Award of Merit was given to W. Marshall, Esq. Auchinraith, Bexley, for Polystichum constrictum da.lk green from \(P\). aculeatum \(X\) angulare, a dense-growing dark \(P\). acu. variety, very erect in growth,
leatum than the other parent.
The effect made by a group of zonale Pelargoniums in sprays, from Messrs. H. Cannill \& Sons, tastefully put up with Ferns mingled, was very bright and distinct. Several new varieties were included, among which we
noticed an unnamed seedling, rich salmon pink with noticed an unnamed seedling, rich esa Marlborough, white eye, as being another seedling, is pale pink and white. Volcanic is one of another seedling, is pale pink and white. the largest and deepest coloured of the purple crimson section, and Owen Thomas,
(Silver-Gilt Banksian Medal.)
sea, again exhibited trusses of flowers representing varieties of their javauicum \(\times\) jasminiflorum hybrids of
Rhododendrons. These hybrid varieties are exceedingly delicate and pretty. Ruby was the darkest coloured, and partakes of Curtisii, one of the parents of this variety; parta roseum is a very pretty pale rose-coloured flower, rather large: Taylori is rosy-pink, and Favourite bright-rose: Princess Frederica is very delicate, and Minerva is similar Princess a little deeper. Maiden's Blush is just a pleasing flushed pink, but the latest variety is named Numa, obtained by croseing R. Curtisii of with R. indico \(\times\) javanicum. Numa has fine deep coloured flowers, after the style of Curtisii, and resembling in great measure the appearance of those of an Azalea, a habit obtained from R. indico \(\times\) javanicum, itself the indica var. Stella. The leaves in the case of Numa are much indica var. Stella. The leaves in the case but larger also than of the Azaleas. (Award of Merit.)

Among the collection of novelties from \(\mathbf{A}\). Brisfoe-Ironside Esq., Burgess Hill, were three blooms of a large Japanese incurved named Arona-blooms of good depth and plenty of fulness-colour buff, with light red shading on top side
of florets (Award of Merit). Bellina, a white flower, and of florets (Award of Merit). Bellow, appeared useful kinds for decoration purposes.
One of the most effective groups of cut Chrysantbemuns was one from Mr. Wythes, gr. to Earl Percy, at Syon House, which included upwards of one hundred flowers in eighty varieties. Many of the blooms represented good culture, and most of them were choice and good. (Silver Banksian Medal.)

Mesars. H. Cannell d Sons, Swanley, obtained an A ward
Merit for the yellow Jananese incurved Oceana. The floret of this variety are very loroad, and the flowers are medium
ize as shown, an d vely pretty. An excellent lot of blooms miscellanoous varieties was also exhibited by Messrs. CANNeLL, amongst which we may mention a few examples to be popular with many visitors, but fails to obtain awards, Altogether there were about eighty blossoms shown in this collection
A small group of Cbrysanthemum flowers from Mr. Pentney, gr. to Mre. Howard, Isleworth, contained some pretty flowers, and they were staged tastefully. (Bronse Banksian Merdal.)
Mr. Thos. 8. Ware, Hale Farm Nurseries, near Tottenham, showed a group of cut Chrysanthemums with long stems, and staged amid plants of Maidenhair Ferns. The group would have been more effective had the foliage been retained by the Chrysanthemum tems. Mr. Ware had also a plant
of Chrysanthemum, A. H. Fewkes, with three good flowers of Chrysanthemum, A. H. Fewkes,
upon it. (Silver Banksian Medal.)
Mr. Slogrove, gr, to Mrs. Crawford, Gatton, Reigate, was the exhibitor of twelve very well-grown flowers each of Thunberg and Mdlle. Mario Hoste. (Bronwe Banksian
Medal.)
Dr.
howed his WaLKER, 12, Lingield Road, Wimbledon, before by the National Cbrysanthemum Society, but no award was given on this occasion.
Mr. R. OwEN, nureeryman, Maidonhead, oxhibited a number of nuvelties, and obtained an Award of Merit for Vicar of Bray, an English seedling Japanese, good heavy bloom of old gold and dull red. Robin Adetr, spale llac coloured large Anemone, also received an award, at did Mre.
R. C. Kingeton, a very large fowered incurved variety of hright pink or roce.
Au incurved pink Japanese, named A ustine Anderson, was shown by Hespt Tate, Esq., Allerton Beeches, Liverpool. No award was made.
Mesars. B. S. Williams de Sons, Upper Holloway, London, N., exhibited half a dozen blooms and few plants of Philadelphta.
An excellent collection of Chrysanthemum blooms was put up by Mr. W. G. Gobrrty, Exmouth Nurseries, including numerous novelties. An Award of Merit was made to Cecil Clinton Chalfont, a full yellow-coloured Japanese flower, useful for decorative purposes. Annie Heard, a modium-sized white single-flowered variety, received a similar award. The white hirsute Mrs. W. J. Godfrey and other fine flowers were fncluded. (Bilver Banksian Medal.)
Half- dosen plants in bloom of Ewan Cameron shown by Mr. Goble, Walcot Nurmery, Ryde, Inle of Wight, seemed to indicate the usefulnese of this variety for decorative purposes. The flower are dingle, large, pure white, and very

Mrs. Jones, Sudbury (gr., Mr. Jones), staged a group of flowers of some of the single flowering varieties, and they were good and attractive, but the effect would have boy greater had a few Ferns been interspersed. The flown had
been well grown (Bronze Banksian Medal).

\section*{Orchid Committee.}

Present: Harry J. Veitch, Esq., in the Chsir, and Messrs. Jas. O'Brien (Secretary), A. H. Smee Sydney Courtauld, W. Cobb, E. Hill, T. W. Bond,
W. H. White, T. Statter, F. Sander, H. William T. B. Haywood, and H. Ballantine.

Sir Trevor Lawrence, Bart., Burford, Dorking (gt., Yr W. H. White), always foremost in exhibiting noveltien od both botanical and floral interest, showed Laddemanads trifolia, Rulfe, n. sp., a most remarkable plant of the growth length, and bearing thirty-three wax-like flowers of abertht orange colour, the sepals being tinged with copperbrome and the tase of the lip, which was distinctly throelobod, having a dark purple blotch. It is one of Mr, Lebmenn's Andean discoveries, and a plant worthy of attention (Pinetclass Certificate). Sir Trevor Lawrenoe also oxhibitod the handsome Cypripedium \(\times\) Pollettianeum, "Burford Baaty" (calophyilum \(\times\) oenanthum superbum), a variety far superior the original, and which received an \(\Delta\) ward of Merit.
Messrs. Jas. Vbitce \& Sons, Royal Exotic Nursery, King Road, Chelsea, were awarded a Silver Floral Medal for onad the best and most interesting groups lately exhibited. The most attractive feature was the gorgeous Lellio-Catllegax callistoglossa ignescens (C. Warsceericzii Sanderiana \(\times\) L purpurata), It is the beau ideal of a charming garden hybrid, its large lavender-tinted sepals and petals and rith purple-crimson lip constituting it a noble flower (Firstclese Certificate). Another fine plant which secured a Firsterlas Certificate was Cypripedium \(\times\) Milo grandis (conanthuin superbum of insigne Chantini \(q\) ), the massive apparanas of the fine glussy flower being rendered all the more striking if the fine glussy fower being rendored sepals. The pretty Lielio-Cattleya \(\times\) Semiramis (C. Gaskelliana \({ }^{\text {fo }}\), L. Perriniq) with fine soft rose flowers with purple-veined lip, recelvad Award of Merit. Among other good things in Mess Veiter's group were Leelio-Cattleya \(\times\) Decia (C. aurea Crispa of) with blush sepals and petala, and rich purple lip with silvery margin, and wonderful kaleidoscopic dighe of colour in the throat; Uattleya \(\times\) leucoglossa, the perty
 dite f), that charming novelty Epidendrum \(x\) Wallisioc-cliarwith yellow flowers having a conspicuous white labollim sisme grorl plants of M1ttonia spectabilis Moreliana, and number of rare Cypripediums, \&c.
Messts. F. Sander \& Co., St. Albans, also staged a ffective group of rare Orchids, which secured a siver bat sian Modal. Thoir most beautiful exhibit was Cyphipedium

Countess of Salisbury (bellatulum \(\times\) barbatum superad Sander's var.) and which (although the species emplos ohtaining it are simoilar to \(\mathrm{C} . \times\) Chas. Richman and ouil was a most delicate, charming and distinct flower, the ane enve heing douhtless due to the fine qualities of its parme It had the usual firm wax-like flowers of its class, the gove it colour white with innumerable dark chocolate doupper surface and a ray like flush of rosy purple ou the upp lessedt a mimilar rosy flush being over the petals, and in cerifase gree the lip. It was awarded a First-class C Catless \(X\) Another fine plant in Messrs. SANDER's groy of the C. L. Cold Miss Cla mith a coloring d the lip; and fine objects weve a pan of Habenaria Surane a pre with many spikes of its extraordinary white flowers, dilise of the new Anæctochilus Sanderianus with olvo the handion of various shades, netted with pale gold; \(t\) Cypripedium \(\times\) A. J. Herrington (Leoanum superbum); the neat and singular Saccolabium acutifitume of the C. hellinum class (Botanical Certificate); Cymbiaum Winnianum, the charming Trichopilia brevis with and ptis volute white labellum and Indian yellow sepals and pentim tarred with chestnut-brown; Bollea Roerzii,
 rich and variod collection of varieties of Cath House, Gat ming (gr., Mr. T. W. Bond), oxhibitod bhat protty and distinct hybrids raised in his gardens by \(x\) auresh, viz., Cattloya \(\times\) Lady Ingram (Eldorado \(x\) fragrant flowers, having pale yollow sepals and plobe In with golden yellow tube and rose-vined front ceilis (Lant a three-fowered inflorescenco; ceana \(\times\) Trianai), a delicately-tinted flower of much that of C. Lawrenceana, and of a sort il. Colio-Cattleya \(X\) purple and crimon in the tube; C. maxima peruviana \(\times\) L. C. \(\times\) elegais purplish plant with large rose-coloured lip. Each of the three received an Award Thos. Statter, Eeq., Stand Hall, Whitefiald, (gr., Mr. R. Johnson), staged a five group all being of of of varieties of Cattleya Dowiana \(q\) quality: Cypripedium \(\times\) Edwardij,
quality: Cypripedium
(Silver Banksian Medal).
(Silver Banksian Medal)
Messte. B. S. Williams \& Son, Victoria and Pa Medal for a neat-looking group of Orchids, in specimens of Pescatorea Roerlii rosea superbum, Catasetum \(\times\) splendens aure plecherianum, witiam vection of hybrid Cypite
pretty C. \(\times\) Adonis, with neat glosey flowers, C. insigne Wallacei, \(\mathbb{C} . \times\) atnandum, \(\mathbb{C} . \times\) Bartelii, and the fine white Celogyne Gardneriana Butanical Certificate)
R. 1. Measurzs, Esu., Cambridge Ludge, Camberwell (gr., Mr H. J. Chapman), showed Cypriperlrum \(\times\) Olemus (bella tulum \(\times\) ciliolare), Masdevalli: sbbreviata :und Pleuruthallis lungissima, the two last being awarded Hutanical Certificates. J. Gurney Fowiek, Esq,, Glebelands, Woodfurd (gr., Mr. J. Davis), showed a time inttorescence of the rare Cymbidium Traceyanum
F. W. Moore, Esq., Royal Botanic Gardens, Glamevin, Dubliw, ent Eriopsis rutidobulbon, a fine species with a dense raceme of orange and purple flowers and white labellum apotted with purple; the elegant jellow Spathoglottis ubescens (Botanical Certificate), and Phalrenopais denticulate (Botanical Certificate); and J. W. Swingunne, Feq., Comdean Hall, Winchcombe, Cheltenhana, sent two twinwhich the second flower is so near the base as to cause the whole to appear like two flower-spikes; one had singnlarly deformed aepals. Also a twin-flowered \(\mathbb{C} . \times\) Ashburtoniax
seid tu be constant. From Mr. Gulzow, Bexley Heath, said to be constant. From Mr. Gulzow, Bexloy Heath, came a few good)
Banksian Medal

\section*{Fruit Committee}

Present:-Philip Crowley, Fsq. in the chair ; and Messrs. R. Hogg, T. F. Rivers, H. J. Pearson, W. Wilks, J. H. Veitch, T. J. Saltmarsh, J.
Willard, W. Farr, F. Q. Lane, J. Smith, W. H. Divers, Go. W. Cummins, and J. Cheal.
One of the most conspicuous and handsome exhibits was
collection of 'eighteen Winter Pine-apples from H. M. Tar Quegn's Garden at Frogmore (gr., Mr. O. Thomas), from suckens planted on October 24, 1894 (Silver Gilt Kulghtian Medul)

Mr. Bmith, gr. to the Earl of Rosesery, at Mentmore, showed three excellent bunches of Chasselas Napoleon Grapes, from Vines grafted on Muscat of Alexandris. In appearance and flavour these Grapee were very remarkable (Cultural Commendation)

Soedling varieties of Apples were exhibited in several instances. Mr. \({ }^{\text {L }}\). E. Thomas, Berkhamated, hall a tolerably bigh-coloured fruit מamed Eureka, of moderate size, presumably intended for dessert purposes. A smonth yellow Apple of good size, known as Ivanhoe, was exhibited by Mr. A. McKav, 63, King gtreet, Dunstable. Anotber variety was rom Mr. T. Spencep, Goodidh Court Gardens, Ross, and Eruisborough,
Messrs. Rivers \& Son, Sawbridgeworth, again showed Apple River's Codlin, a dessert fruit, and another one for kitchen use, known as Rivers' (St. Martin.
\(\Delta\) rather hard-looking russety \(\Delta\) pple, known as Reinette de Damson, was exhibited by Messrs. Veitch \& Sons, Royral Exotic Nursery, Chelsoa, and a fairy
kitchen use, named Fraise d'Hoftiger
kitchen use, naned Fraise d'Hotnnger. A dish of sm: tll purple \(\mathbf{I}\)
shown by Mr. O. Thonas.

Black Hambro Grapes, grown and ripened in the open air, were from the Rev. J. R. Domecow, Menbury, Chard. The berries were coloured, but were not very awect. (Vote of Thanks.)

A collection of Apples and Pears from Jersey were sent by Mr. H. Breker. The few Pears were good, but the Apples were by no means remarkable. (Silver Banksian Medal.)
An extensive and conspicuous callection of Apples and
Pears was shown by Mr. W. H. Divers, gr. to the Dure or Rutland, Belvoir Castle, Grantham. About seventy dishes of Apples and thirty of Pears were included, the quality being generally high, especially for the district. !Silver Gilt Knightian Medal.

A large, rather pale-coloured, culinary Apple with large open eye, named Jonkinson's Seedling, and another one known as Dewdney's Seedling, were hown, and the Committce dosired to see them again.

\section*{SOUTELAMPTON.}

Novmaine 5, 6.-The Royal Southampton Horticultural Society had ite annual autamn how in the Victoria Hall on the dates given above, which was, in maay repecte, above the average of these shows.
The groupa of Ohrysanthemums staged for effect were very auperior, and in this class Mr. O. Horsay, gr. to J. E. E. Rerwhar, Eaq.. Elmfield, Southampton, took the first place; and Mr. J. Amys. gr, to the Hon, Mrs. Elinott Yorieg, of Hamole Cliff, southampton, the 2nd. Messrs. H. \& J. VARe, Chilworth, and Mr. A. Bnowr, Hill Farm, Southampton, were exhibitors staging well-grown examples of leading varieties.
The groups of miscellaneous plants undoubtediy formed a very plensing feature here. Mr. E. Oarr, gr. to W. A. Pichett, Keq., Fair Oat Park, Bishopetoke, came in a good let, with a
group which left Jittle to be denired in the way of arrangement.

\section*{Cut Bloomg.}

These formed an extenaive part of the show, and formed, as uound, it most attractive portion. For eighteen Japaneee varieties, distinet, Mr. Ivelamield was lat with a good set of
blooma Mr. P. Pentord, gr. to Sir Y. Titzwigram, Bart,
M.P., Leigh Part, Havant, wae 2nd. In a mimilar clase for incurved varieties, Mr. J. \(\Delta\) Gste, Havant, was the winner of the lat prize. For twelvo Japanese varietion, diastinct, Her Majesty the LUeEN, Ouborne, Isle of Wight, and Mr. PkN Fond, were placed expual let'd, so clooe in pount of merit were the two collections.
An interesting clasy was that for twelve Japanose varietion the blooms to be cut with long stems furniehed with foliage let, Mr. Carr, with a very worthy oxhibit.
This list does not exhaust clames that were provided for cut blooms, of which, it will suffice to say, that Memars. AGATE, Pempord, and Inglefield, ecured the higher awards.
Frait was capitally shown, eapecially Grapes, which were very fine indeed. Mr, Sanders, Andover, and Mr. T. Hall, gr. to Sir S. Montaque, South Stoneham, were among the more succesaful exhibitors.
Mr. Miles, gr. to W. Perizims. Enq., Portewood, Southampton, ataged really handsome deseart and kitcher Applea, wianiag the leading prize in each clen.

\section*{HANLEY CHRYSANTEEMUM}

Novemars 5, 6.-The thirteenth annual exhibition by the Hanley (Staffu.) Chryaanthemum Society wat opened on Tuenday, Nov. 5. In extent and in the quality of the exhibite also, the show wat equal to any that have been previoualy held. The Victoria Hall (an excellent building), wat well filled, and the hon. secretarien, Mesart. Joneph and Arthur Kent, had arranged everything in a aatisfactory manner. It was thought mome ehort time aince that the society would have to dinsolve through insafficiency of financial means, but the exhibition jutt held proved that if the necenary aupport from the townapeople be forthcoming, there need be no doabt as to the auccess of the mociety in promoting good exhibitions.
There were several exhibits for groups of Cbrymathemums, and Mr. J. F. Madpocr, of Aloggar, who took leading position in the clase for a group arranged in a memi-circle, was very commendable. The best group of miscelleueous plants apranged with a view to producing the beet effect was from Mesare. Jesermson * Sows, zurserymen, Newcuatie-under-Lyme, who, by the proper ase of Orchide and Ferne, made a very attractive group.
Mr. J. MOPHill, Superintendent of the Queen's Park, Lougton, had the best half-dozen plants of large-flowering Chrysanthemum", distinct varieties, and other similar classes.
Cut blooms of Chrysanthemums, were shown in compara. tivaly good number, and the quality was'quite equal to expectations. The beat tweaty-four incurved, in twelve varietiee, were exhibited by Mensri. J. A. Panson a Soma, Chilwell Nurseriew, near Nottinghama and Mr. J. MoPHaIL was the winner in the class for an equal number of Japanese blooms.
Mr. McPrail had the beet twelve incurved blooms in dietinct varieties; and the beot Japaneso blooms in twelve distinct varieties were from Mestrs. J. R. Pearson \& Sons. There were clasees also tor amateura, and local single-handed
gardeners. Miscellaneous competitions included clasees for floral arrasgemento, planta for table decoration, Primulas and other plante, and Grapes.

\section*{HEREFORD FRUIT AND CHRYAAN TEEMUM.}

November 5, 6.-Tair Society held it annual show on the above daten, and it mast be gratifying to all intereated in the Society to witness ite yearly increased auccess, both with regard to the namber and quality of the exhibits, and it financial condition. This matiafactory atate of thinge may be rightly attributed, in a great measure, to the ener. getic and all-round good management of Mr. Oagh, Hon. Sec.
Apples and Penra were, as is uaual, the leading feature of the show, and when it is said that about 3000 disbes of these fruite were tabled, most of them being remarkably good, and not an inferior one amongat them, an idea may be formed by the reader of the importanoe of the exhibition. An intereating exhibit was gisty dishes of cyder Apples from the Pomological Society of France; thase did not, however, compare favourably, either in point of colour or size, with the same type of fruit shown by Mr. J. Watiliss and Mesars, Crington \& Co. The above French Society meat also ammples of bottled eyder.
There were three entriee for fifty diahes of Apples, diatinet. 1st, Mr. J. Watkiws, Pomona Farm, Hereford. Amongst his beat dishes were Peasgoo l's Nonsuch, Blenheim Oramge. Gascoipnes Seedling Byford Wonder, Striped Beaufin, Washington Rmperor Alerander, and Winter Nonsach. Memers. ton, Rmperor Alexandor, were a good 2nd, having Allriston, Cranston a Co., Hereford, were Lane's Prince Albert. Biemarelk, Peaggood's Nonsuch (very fine), La Pippins. Schoolmantor, and Royal Jubilee, King of the Pippins, Schoolmantar, and Warner'a King amongst their best dish
gro to Enrl of Covempar, Croome Court. T. Wright, gr. to C. LeE CAMPBELL, Keq.e Glowston Court, Rowe this was also C. Leod collection; some of the best divhes were Winter Non\({ }^{\text {a good }}\) gooll auch, hane a Pricia. 2nd, Mrs. Evixa, who bad good dishes Cax't Oradge Pippia. 2nd, Mrs. of Wamar'in King, Mere de Ménget, Cox'o Pomons,
Mr. Ward, gro to Lady RMLLY Folery, Btoke Railh.
wae the only exhibitor. His bent dishem were primantom Duchosa, Doyeuné du Oomion, Napoleon, Glou Moronus, Heurre Diel, Ylemind Beauty, te.
Twelve diebee of Peara - - Mnt, Mr. Painter, ©r. To Mer. Wisl. \(1.1 \Delta \mathrm{Ms}\), Rorhford Houne. Tenbury, buving rout dimben of Lowive hompe of Jermey. Doyenne du Comice, lleurre Clantpean, \&:

Applea: Twalve diuben oulinary nud (welve domant int. Me. Arindrod, Er. to P. Y. Pwiluse Miw., Whatheld, who had fine dithes of Gnsooigne's Beetliak, Peragcod's, Cos'e Pomona, Riboton Pippin, Ooz's Orange Pippin, da. ; 2nd, Mr
 Mr. Willimma, gr. to Bir Joskpa plytucy
For the best dish of cuhmary Apglen in the nhow, Mewres. Cranstor \& Co. were let, wilh a grand lot of highly coloumed Peasgood's Nonsuch; and for the beat dimh of dessert A pplea, Mr. Whaler wou with a fine difh of Cow'p Orange Pippin.
For the boot dieh of Peare, J. W. Palmen, Eng.. A Ileston's Hor the baet dieh of Rears, J. W. Palmea, Ming.. Ayleston'u or bent flavoured Pearn, wilh Thompson's.
There wore numproua mallier clamon, which wiepe well Alledt. as were almo those devoted to larmern. Apecinl prises were elto numeroun.
Graper wera fairly well nhown, mome of the bhack varietien
being very good. Mucala, however being very good. Muscala, however, wore not first-rate, many of them beng shrivelled, owing doublloms to the hot, dry season; and othem were far from being woll ooloured.
For a collection of six kinde of fruit.-1 ot, Mr. Haprio, Kr. to Lady H. Som हnskT, Kantnor Caatle, Ledbury: 2nd, Mr. Grindrod: 3nd, Mr. Williama.
Three bunchee of Grapes, Gron Colmap.-1st. Mr. GrinurRod: 2nd, Mr. S. T Whagr; 3rd, Mr. Williams. Thi wel 4 good cluss.
Three bunches of any othep bleck Grape, -list. Mp. Wriayt, with good Black Alicanten; 2nd, Mr. W\&RD, with mice Alnwick Soedling.

Three bunches of Muscat of Alexandría. - let, Mp. Frogett, gr, to M. Harmila, Eeq.: 2nd, Mr. Ward; 3nt, Mr. Williams.
Three bunchee of may other white Grape. -1ut, Mf. Williame.

\section*{Chayantafmums}

Out blooms were remarkably well ahown, and better than they have previoully been eeen at Herford. Groupe, however were not no numerous na at previous shown; but the one which took the let prize, namely, one baving a apace 12 feet by 7 feet exhibited by Mr. Williams, gr. to Sir J. Pullev, wae perfect in every way. The chies priza-winnorn for cut blooms were Mr. Lockyer, gr. © C. HANBCRy, Knq. Pontypool Park; Mr Robinson, gr. 10 K. W. D. HAHILY: Ent. ; Mr. Whliama, Mr to General (inhathitr. Trew yn, Aberkavenimy; Mr. Davis, gr
 mercial 8treet. Heroford, and Mr. Whitime. Whito CromNursery, Hereford, had beautiful wreatho, crowen, Ac, comsposed ebiefly of Orchids, Rucharin, Callas, white Chrysanthe-
mums, and Oarnations; while Messrs. Clibran 80 , Altriacham, ehowed baxee of cut Chrysanthemun, principally new varieties, fine in oolour and form. Thos, Coomber.

This table wasition to the of reat intereat, the fine colour of the fruit, in addion to the size, made rany exclaita: "With such Apples and Peava as theee we shall not want fruit from Americn," ke.

\section*{CIRENCESTER CHRYSANTHEMOM.}

November 6. This bhow took place in the Corn Exchange on the above date, and was in all probability the best ever held by the society, though it an not appear to be supported by the townspeople an it deserves to be-a fate usually experienced in purely agricultural districts.
There were two open classes only, the one for six specimen plants of Chrysanthemumg, the best coming from Mr. H. R Saunders, gr, to James Taylor, Esq., Rendcomb Park, who had admirably grown and flowered brish plants of John Shrimpton, Edwin Beckett, and Source d'Or; and of incurved, Mrs. Dixon, White Venus, and Mrs. Haliburton, this being the only exhibit.
The other open class was for thirty-six blooms, eighteen ncurved and eighteen Japanese. Mr. Geo. Price, gr. to Mrs Bulley, being the only exhibitor, with fine examples of Lord Alcester, Mrs. R. C. Kingston, Baron Hirsch, Violet Tomlin Golden Fmpress, Madame Darier, \&c., among the incurved tolden Kmpres, Madanese Col. W. B. Smith, Eds Prass, Vivind More Molyneux, Duke of York, Miss Doroth Shea, Charles Davis, Rose W ynne, \&c.
Shea, Charles Davis, Rose W ynne, \&c.
Groups of Chrysanthemuma made a very good feature, and bging relieved by the addition of foliaged plants, lessened the effict of stiffness usually seen, but there was too much crowding. The best came from Mr. W. Larner, gr, to JoHn Hrde, Esq., Southleigh. One other group set up by Mr. D. Elkins, gr to A. CATOR, Esq, had to be disqualified as containing plants of Chrysanthemum frutescen, but an extra prize, equal to the 2nd, was awarded to him. A class for a smaller group brought several pleasing exhibits from local growers. Mr. Kirby, gr, to H.F.GARE, Esq, the Hon Secretary, taking the 1st prize. Some fairly good specimen of plants of incurved and Japanese types were staged in their several classes.

\section*{Cut Blooms}

In the way of cut blooms, the beat eighteen Japanese came from Mr. D. Elinins, A. H. Neve, Charles Davis, Sunflower, W. Seward, Boule d'Or, and others, being in excellent charac ter; Mr. G. Price was 2nd. With twelve incurved, the same exhibitors were severally 1 st and 2 nd . Sixes of each were also good. Mr. Price had the best six blooms of an incurved variety, showing Violet Tomlin in excellent character; Mr. Humphries, gr. to J. L. Buraess, Esq, following 2nd, with Bapon Hirsch, which promises to be a very usefal incuryed. Mr. Price also had the beat six blooms of a Japanese variety, having Col. W. B. Smith in splendid form; Mr. Elifins cuming 2nd with Mdlle. Thérèze Rey.
Sowe good blooms of Anemone-flowared types, as aleo Pompons and singles were staged; of the latter, Mury pretty.
l'ases and Eipergnes of Chryannthemuma relieved with foliaga mide a charming feature, Mes. Sarf, leading the way with very tasteful arrangemonts. Baskets of blowms were also very pretty, and these formell of autumn berries and folinge. shown by children, delightfinl. All these were instructiva ohject lesens in the way of home decoration.
Grouns of stove and gresnliouse plants, Primula sinensis, double and single Mignonette, zonal Pelargoniums, Poinsettias, planta for tab'e decoration, and othar subj xets lent variety to he show, and extended its intere \(t\).

Fruit also found a place in the schedule, and vegetables also. Mr. Saunders had the best three bunches of white Grapes Mr. Price taking the lat prize with the same numbir of black. Mr. T. Arnold, gr. to Carl Bathurst, was lst for gix varieties of dessert Apples, as also of culiaary; and with the same number of Pears, showing very good samples. The bsst collaction of nine varieties of vegetables came from Mr. J. Baker, gr. to Col. Porter. Nor are the cottagers forgoten, for classen for Chrysanthemuma, and also for vegetables were provided for them, and they exhibited in a very creditable manner.

A very interesting group of Cuniferous plants, also a fine and varied collection of Apples, were shown by Messrs. J. Jef Feries \& Sox, Cirencester. Mr. O. OrPET, nurseryman, Dyer Street, had a collaction of stove and greenhouse plants. Mr H. DYER, Springfield, also had a collection of Chryanthemum of an attractive character.

\section*{HITCHIN.}

November 7.-A auccenfal pxhibition of Chrysanthemum and fruit was hell in the Corn Exchange at Hitchin, Herts, on the above date.
Among the best thinga shown were the groups of Chrysanthemum plants from Mr. J. F. Parsons, gr, to W. Spencer Esq., Codecate Lodge, Hitchin, 1st; and those from Mr. Prisman, gr. to S. Lucis, Esq., Hitchin, 2nd. The plants of the first named exhibitor were very good, and possessed of fine large flowers.
Mr. W. Springham, gr. to J. H. TUKE, Esq, Hitchid, had the beat specimen plants.
Groups of miscellaneous plants formed a pleasing and desirable feature of the show, and the highest prize fell to Mr J. F. Pansons, for a creditable arrangement, in which Palms, Orchide, and Salvian, played the chief parts.
Cut blooms were numerously shown in competition, and the quality generally was good. P. Bosanquet, Faq., Paffield ( \(\mathrm{Rr}_{\mathrm{r}}, \mathrm{Mr}\). J. Turk), was 1st in the class for twenty-four Japanese varietien, distinct, hil fiowern being large, richly coloured, and consisting of leading waristies; F. FEWWICK
 artless), was 2ad.
For twelve Japanese varieties, M. Prior, Req. Mama House, Knebworth (gr., Mr. Pateman), took the leadigg prive good set.
For twelve incurved varieties, distinct, Mr. Harruss wa 1st, with creditable examples. For six incurved, one ratiety Mr. Hartless won with really good specimens of In Alcester.
White-flowared Japanese varieties were well represeated in the class for sir, one variety, and Mr. J. F. Parsoms we with Mdlle. M. Hoste
For any coloured variety, Mr. TURK stagel Suulowar in capital condition. Pompons were best shown by Mr. Trax. Table decorations, of which the Chrysanthemum formid thy chief feature, were abundantly shown, no fewer that in tables being set out with them. In this compotition, hu
C. E. Foster, Bancroft, Hitchiv, was deserrelly amel C. E. Foster

Some excellent fruit was noted.

\section*{ASCOT.}

November 6, 7.-The grand atand of the Areot racecourse was chosen as the place for holding the Chrysanthemum exhibition, which was abont the average of uch shows as regards the quality of the various exhibite. Cut blooms were, as is now aund, the more important mection so far as attractivenem goen.
For eighteen incurved and eighteen Japanase rarioticm distinct, for which a Challenge Cup was offered in addition to a money prize. Mr. W. Lane, gr. to Miss J. D. Santi, King's Ride, Ascot, was placed lat for substantial shapk blooms in both sections ; and Mr. F. J. Paul, gr. to Ma Bowring, Forest Farm, Windsor, was a close 2ad.
For eighteen Japanese, Mr. A. Sturt, gr. to N. L. Corima Esq., Round Oak, Englefield Green, Kgham, was easily la with the best bloo ns in the show; and Mr, E. Johnson, gro w A. Gillilatt, Esq., Duffield House, Btoke Roges, Sloukh was 2nd.

For twelve Japanese varieties, 1st, H. White, gr. to the Marchiones Covynowam aseot, and Me Tarmer, H. P. Leschalles Hyams, Windlesham, and.

Eur siz Japanese, Me. Hawthorne, ge. ts St. Grosaris Scanol, Ascot, wod. Mille. Mirie Hoste in the chass for ix Japanese, any white variety, placed Mr. E. \$mes, gr. Captain Hanbury, Ascot, in the lat place; as did Virial Morel for Mr. Farmer, in the class for six Japaraw of as Morel for Mr. colour.
The best twelve incurve I Japnnese blonms were those stagit by Mr. F. Paut, and the incurped blooms, it may be mid made a good display generally.
For eighteen distinct varieties, Mr. F. J. Piut wis an 1st; Mr. A. Sturt being 2nd.

In the class for twalve bloons of incurved varieties, the th prize fell easily to Mr. FАRMer; and for six ineurved, th highest aw ard went to Mr, Brro for bloums of Lord Wuble in excellent form.
The trus reflexed varietios of Chrysanthemums wir rel shown by Mr. W. Neate, gr, to Miss Mackab, suang who was placed lat for twelve blooms, distinct ; Ms. E. . being 2nd. Mr. E. R. Smee had the beat six varietied mixt ssction; and he was also th

\section*{Anemone-flowered varieties.}

The premier Japanese blooms ware those of Mulana cun and C.H. Curtis, both of which were shown by Mr. PLUL, very fine examples to3.
Plants were good, and Mr. Hawthorere was let to to trained specimens; and Mr. Neste was lat fot plantrgen as bushes; also for four Pompons. For a group of Ohry mums, Mr. Lave won with plants carrying extre blooms; and Mr. Haw rHonne was 2nd with a gre
arranged, but which lacked quality in the flowers.

Fruit and vegetables were very well represented by a nulio of horticulturists of the district. Messrs. J. STA arranged an interesting group cousistiag of mindale, ha plants. Mr. Thorne, gr. to Maj jr Jotcer, Sunningdable dili pleasing group of choice miscellaneous plants, creditable ith to himself as cultivator, and an scquisition to the exaibin

\section*{BRIXTON, STREATEAM, AND CLAPGAM.}

Plant Groups. - These were divided from ese prize was won in fine style by Mr. Poaltom,

Carcer. Req., withpleasing harmony of white, pink, yellow. and bronzy-red; the flowerg also were of extra good quality. and zuite fit for the exhitition board. Mr. Muraell, gr. to and quite fit for the exhitition board. Mr. Mursall, gr. to
Mrs. Burtor, who was let last year, staged even better than Me did then, but he was fairly bsaten by hia rival. The great be did then, but he was fairly bsaten by his rival. The great
feature of this group was the dwarf growth of the plants, those feature of this group was the dwarf growth of the p
in the front being little more than 1 foot in height.
For six trained specimens of Japanese, Mr. Weston, an old exhibitor, g'. to D. MARTINEAU, Esq., Bhowed a fine set bearing a profusion of well-developed blooms, his best being Margot, Mise Watson, Madame Rendatler, Madsme Levid, Marg La Triomphante.
With six reflexed or incurved, Mr. Cherry, gr. to Mre. GABRIEL, showed well, and reocived the premier award, Glbriel, show his best being Mrs. Geo. Rundle and Mrs. Dizon,
two of his best being Mrs. Geo. Rundle and Mrs. Dizon,
The best six Pompons were from Mr. OrFRry, also the rarieties of Cedo Nulli standing him in good stead, also Commander Schneider and Frémy. Mr, Wraston wes a close 2ad, Black Douglas being one of his best.
Mr. Swain, gr, to E. JoNFs, Req., was 1st, for three pyrnmids or standard of Pompons, showing all of the latter style and of the Anemone section.
Mr. SWark was also lat for three plants of large-flowered Mr. SWAIV was also lat for three plants of large-fowered
varietieg, his plant of Viviand Monel being of rich colour and with fine blooms.
An excellent class was that provided for twelve Japaneze, in \(4 \frac{1}{3}\) inch pota, each plant to carry one bloom, this produced a good competition. Mr. T. Stevens, gr. to B. F. Smitre, Esq., was lst; and Mr. Murselt a close 2nd; the beat varieties being Viviand Morel, Oomto de Surani, and Chas, Davis.

\section*{Cut Blooms (Japznese)}

Mr. Howe, gr. to H. Tats, Esq., showed a grand stand of twenty-four blooms, of large size and very fresh, and uniform throughout, the best were Col. Smith. Viviand Morel, Ed. Molynour. Eda Prass. Chas. Davis (extra), Colonel Chase, Marie Honte, Visconnteas Hamuledon, H. L. Sunderbruck, and a perfect bloom of Lord Brooke. Mr. Munsell followed with
another excellent boavd, Mr. Beward. Deail de Jules Ferry, and another exoellent boavd, Mr. Seward.
Excelsior here were of special note.
Mr. How w was also lst for twelve blooms on long stems as Rrown, he staging again some fine flowers, Lady Sanders, a broad petalled pare whita, wan extra good. Mr. Mursell again followed, and that quite closely, for 2nd place. In both instances the foliage was good, thus adding to the effect.
For twelve broad-petalled varieties, Mr. Howt was placed lat, with an admirable lot of flowers. the hast of which were Colonel Smith. Lord Brooke, Mrs. W. Howe, and Lonime ; Mr. STEVENS
Lord Brooke
For aix of any white varicty, Me. Mursei, was a worthy
1st, with almost faultlesa flowers of Madame Thérese Rey, very pure in colour; Mr Howe being 2nd, with Madame Carnot. For siz of any other colour, the positions were reversed, Mr. Howe winning with a splendid set of Lord Brooke.
In elass for twelve varieties, Mr. Stevers won with an even stand, the best being Madame Hoste, Sunflower, and Charlen Davis: Mr. Poultor, followed up strongly \& ir 2 id place, Louise and Sunflower being conspicuouy.
Incurv-d, \&c - The \(b\)-st twenty-four incurved, very uniform, and of medium size and fresh, came from Mr. Strff.ss, Baron
Hirsch. Princesg of Wales, and Empress Euginie being the best blooms; the 2nd prize lo \({ }^{+}\), from Mr. Roff, lacked size
Mr. Stevens was alvo 1st for twelve Anemones, with a strong board, the best being Delaware (extra). Nelson, and Judge Benedict; Mr. Fulbrook, gr. to B. B. BA Rer, Esq, also Judge Benedict; Mr. Fulbrook, Cr . to B. B. Bak
ataged well, his best baing Lady Margaret and Gliick.
Mr. Wreston had a fine dozen trebles of Pompons, very bright and well set up, not, too, in a formal manner; Mr. Milsom, gr. to G. A. PAYNE, Esq., following closely, some of the flowers being over-blown.
A keen competition was evinced in the clase for twelve blooms, any varieties, open only to single-handed gardeners or amateurs, eight lots being staged. Mr. Farron, gr, to \(G\). Re Preplfss, Ksq., won with a fine dozen, proving him to be quite capable of entering the open classes; the best here were Cham. Davis, Viviand Morel, Rose Wynne. Mrs. C. H.
Yayne, and Silver King. Mr. W. Smith, gr. to thg Rev. S. N. Payne, and Silver King. Mr. W. Smith, gr. to the Rev. S. N.
Ranson, showed well for 2nd place, the blooms being bright Ranson, sh,
and even,

\section*{OTERR EXHIBITB.}

At this show these are always an important feature. Ferns are erpecially good, the 1st prize going to Mr. Hill, Er. to robnst health; also Gymnopramma schizophylla gloriosa, \(G\). Laucheana, and Adiantum Farleyense. Mr. Jones, 作r. to N. N. Sumpwood, Esq., who followed, had Gymnogramma peraviana argyrophylla and G. schizophylle gloriosa, both in fine Condition.
Orchids are also shown well, Mr. Ranson having a strong hall-dozen, Vanda Sanderiana, Oncidium varicosum Rogersi, and Liparis longipes, the latter a lovely Orchid, with long pendalous spires of minute but sweetly-scented flowers,
Toliaged plants were shown well, the best coming from Mr. Chalk, gr . to A. Normandy, Esq. Primulas, table plants, and small Paims were also well sbown.
The best bisket of cut Chrysanthemums arranged for effect Ems shown by Miss Crook. Mr. Stevens, gr, to M. A. Voss, Which had the bast arrangement of other flowers, amongst Which Orchids were a feature.
Frait wha also staged in firnt-rate condition; so also were prodable in baskete-still a good method of exhibiting these products.
Miscellaneous exhibits of fruit and flowers came from Mesars.
J. HEED \& Bows and of flowers from Mr. J. E. KNiaHTs. \(H\).

\section*{CHESHUNT, WORMLEY, AND DISTRICT HORTIOULTURAL MUTUAL IMPROVEMENT.}

November 7.-The fortnightly meeting wa held on the above date in the Society's room at Turnford, and a large number of members was present. Mr. F. S. Hatchason presided. After the traneaction of routine buinese mattors, Mr. J. H. Dama contributed a useful paper on Prars formarket and privati des. In the course of his paper be dealt with the poiltion that trees planted for market parposes ought to occupy, and aid that out of the hundred of varieties, comparatively very few are it for market parposen. These ought not to exceed twelve, and in quantity anfficient to keep the market aupplied with vurieties in anccession.
The twalve rariotice which be recommeaded for utandard trees are Citron des Carmes, Jargonelle, Wallisme' Bon Chrétien, Beurré d'Amenlis, Henale, Cloppis ľavourite, Louiee
Bonne of Jersey. Fertility, Beurré Superfin. Princees, Durondeau, and Doyenné du Comice, these civing : Buccestion of good Pears from the middie of A ugust to esrly in November, which is late enough, as storing tor long periods of time does not pay the market man. Standards of from 5 to 6 fent in height of stem were recommended. Another system practised by some growers for a market mupply is that of buobes worked on the Quince, which allows a large number of choice kinds to be growa in a masll area, if needs be, the varioties to be taker being Williams' Bon Chrétien, Dr. Jules Guyot, Clapp's Favourite, Louise Bonne of Joraey, Beurfé Superfin, Marie Louise (double grafted), Consoiller de la Cour, Pitmaston Duchess, Doyenné du Comice, Conference, Beurré Clairgean, Durondeau, Emile d'Heyt, Josephine de Malinen, Beurré Bultet Père, and Dushems d'Angouleme, which forms a select list of grod large and choice Pears, which would command good remunerative prices in the market.
Keferring to Pears grown for private urc, be add this was practined by masy, but really understood by fow, an a great many take up a nurseryman's catalogue and mete a selection without any regard to the postition they are to ocrupy. Mr. Denn went on to apest of cordons, espaliers, wallm, \&cc. At the close discussion easued, and Mr. Cleaver referred to the alittiog of the bark of atandard trees to make them prolific; Mr. Gotber to orchards plantel under Lian; Mr. Harrimon Pegra for succesaion; Mr. Simons. prolonging the season under glans. Mr.W. L. Jaten mpore of the rarietien Chaumoniel.

The next meeting will the held on Friday, November 22, When Mr. A. Pearee will contributo apypar on "The Tabeross Begonia

\section*{PUTNEY, WANDSWORTH, AND DISTRICT.}

November 7, 8.-Toe eipbte inth annual exhibition, held at the Cromwell Hall, wa, in all respects a most eatiafactory one (tave in attendance of the public, the weather being most anpropitious), the hall being crowded with plant and cut flowera of saperior quality.
Group of Chrysanthemums - The competition in this clase was reen, the premier position being given to a splendid lof, in which fine Japanese flowers predominated, to Mr . J. Williamson, gr. to T. S. JAY, Eeq., Putney Hill: a mont creditable 2 nd being Mr. W. Jonver, gr. to Mine B. Allenswood

Potikr.

Sir reflexed: 1st, Mr, O. Berrler, soteworthy bere ware Amy Furza, Piak Chrietine, and Cloith of Gold; 2nd, Mr. J. Whitiot
Twelve Pomponn, distinct, in bunches of three. a very pretty clana : Iof, Mr. W. J. Wriaut. who had noe flowern of Xdub. Elise 1 Ordmp, Mdife. Martha, and Princt of Orange; 2nd, Mr. . Bentley.
In the rlamen for aingle-hasded gandenom mome very meritorfous flowers wore nown.
Twelve facurved: 1et, Mto J. Dapk, gr, to J. Rooritn, Eeq.o whowe stand contained fine bloown of Mr. Bunn, Baron Hirman. and Gem ; 2ad, Mr. E. P'earce, Er. Lo W. 8. Pariky Mel
Twolve Japacese : let, Mr. J. Holmen, Er. to W. B. Hoonm, Eisco. some of whowe beat flowers were suntiow
The premier Japanese bloom whe Mdlie. Théren Rey, ahown by Mp. W. J. Wrialit. Premier incurved wat May Tomilia, from Mr, Portbury.
Bouquets of Chrysinthemums were very taitefully ahown. Adiantum cuneatum, arranged with white add yellow floworn, were very effective as found in the lot prize exhibit from Mr. E. Phanck; zod, Mr. P. Pottrer.

Some good groupe of mixed plants, flowering and foliage. added attractions to the show, the principel prize winasrs being Mesars. Pottes and Bemtery. A good competition resulted in the clases devoted to Primulan, but wo bave seen better flower.
Fruir mado an effective exbibit. For three bunchee of Misch lismburgh Grapen, Roort momples frow Messrs. A. Merciver and U. Bemthur mined the awards ; willet to the correapmading clan for Muncat of Alexandria, the chief prizewinners were Mensm. G. Huthow and d. Alexamper.
Densert Applee were figely thowa by Memern. J. Pontbumy and W. Thw.
In the clast for three disbes kitchea Applee, wome wonder fully foe examples of Band inghem, Biwmurck, and Alfrieton gaiped the chief awart for Mr. P. Cevanagh, gr. to Madame NTUART, Roehampton; 2ad, Mo. C. Akexanner.
Mearn were nucreafully ahown by Me.m.m. A METEVIN and

 Mood devices in Chrymathemume, wrenthe, cromer, to. \% and Mr. H. Berry, gr. to HUGA C, BMYTE, Req, a fire collection of Applon.

\section*{FOREST GATE CHRYSANTHEMOM.}

November 7. 8 9.-Trie soc ety hat only been calablimed foar years, and, is spite of ite jouth, it may be congratulated on the excellence of the exhibition beld in the Tuwn Hall, Strutiord, and opened by the Countese of Warwick. Tre eproups contributed by amateurn and gardenere contitated quite a feature, and the clases for cat blooms were terdly conteated with fine apecimens. In the group competitions, quality and eff, ct were the leading fentore ruling the jadges' awarde.
In the clase for thirty-six plantr, Mr. W.J. Smith, Plaistow, gained premier honouts with a fille bank- lapanees and ia curves flower, especially qood: MP. C. T. Coure coming in 2ud with a very creditable lof.
Twenty-four planta. Here fine arrangemeats secured the leading prizen to Mr. T. Jomes, Plaistow, and Mr. B. J. Fick li, Forest Gate.
Twalve plants... The Japanese in the let prize lot contributed by Mr. T. J. Yitzaerald, were exceptionally fine, a clome 2ud being Mr. W. C. Latirmmorio.
For tho best three buat pian
For the best three bush plants, any variety, Mours. Bntont and Howerell examples, the group occupring a well grow deners' class. The Japanese in the lst-prize this, the parMe. R. Kenyon, gr. to A. F. Hills Emq., Woodford, 19t, were noble flowers; a good 2ad being Mr. J. WA AD, Buston Road; While a beautiful lot teat by Mr. O. FrTcri, Leytonotone, wa very highly commended. We would mughent that in future the committee request the exhibitora to name their planta, It would add much to the interest and inatruetion of plestors and others.

\section*{and others.}

found in Baron Hirsch from Me. Trckle, Stratford.
A good collection of fruit (Grapes, Apples, and Pears), not fur competition, was sent by Mr. R. Kenyon, gr. to A. F. Hills, Ceq., the tables being decorated with foliage plants (affording a foil to the glare of colour), contributed by Messrs. Titmouse and Kenyon.
Mr. G. Pritchard, Forest Gate, sent a most intaresting and variel collection of Cacti, which attracted much attention, as being the culture of an enthusiastic amateur of these carious and beautiful planta.

\section*{DEVON AND EXETER}

November 7, 8. -This exhibition, with regard to the number of the entries and quality of exhibits, was one of the best yet held by the society. To meet the wishes of those who thought an extension of time would be an improvement, the show was kept open for two days instead of oue as formerly, but the wet and stormy weather, which persistently dogs the footsteps of this long-established society, prevented country visitors from attending, and there was a falling off in the receipts.

Considering that the value of the prizes offered is not very temptiog, the competition throughout is often, and was on this occasion, very keen.

\section*{Chrysanthemua Groups.}

In Class 1. for Chrysanthemums in pots, not fower than eighteen varieties, arranged in a circle of 9 feet diameter, quality of bloom to be the first consideration, effect also to be considered, the lst prize went to Mrs. A. D. Sim, Knowle
(ar. Mr. Willians); the 2nd prize to W. Brock, Esq, (gr., Mr. Williams); the 2nd prize to W. Brock, Esq,
Parkerswell (gr., Mr. Ruwland). This was a close contest, for, while Mrs. Sim thowed the larger blooms, Mr. Brock's as a group was more effective. As proof of this the National Chrysanthemum Society's Certificate was awarded to the 2nd prize group.
2nd prize group.
In the winnin
In the winning collection the best were W. H. Lincoln, Viviand Morel, Col. Smith, Waban, and Lord Brooke. In the and were W. Tricker, W. Seward, Harman Payne, and W. H. Lincoln.
Chryantheniums in pols, not fewer than twelve varieties, arranged with foliage plants is a circle 9 feet in diameter, taste in arrangemont to be the primary conaideration, Mr. Broeir was lat, and Mrs. Sim, 2nd. Both collections were excellent ; Mr. Brocik's the more graceful and richer. looking of the two, the bleading of Chrysanthemums Crotions, Palms, and Asparagus befing a fine bit of work.

A miscellaneous group of plants, not more than twelve to be Chrysanthemumas, in ' 6 -inch pots, urranged for effect on a stand 7 feet square, raised 1 foot from the ground, and not
more than 10 feet in beight. Mr. Brock was 1 st, Mr. T. Chapman (gro. Mr. Emmoet), 2 2d. The winning
collection was well put together, and the effect was light, graceful, and harmonious. The plants used were Poinsettias, Bouvardias, Salvia Pitcheri, Richardias, Tuberoses, Adiantums, Cypripediums, edged with Psnicum variegatum and erowned with Cocos plumoea.
The 2nd prize group was spoiled in effect by a belt of Scarlet Pelargoniums in the centre, over-weighting it with a cullour which requires discrimination in the using. In the smult claneas, Poinsettias and Bouvardias were good, Solanums fair, Cyclamen and Primuls weak, and Violets fatr.
A new elass introduced was that of six plants for dinner. table decoration, three to be in flower, and three tu cunsist of handsome foliage, the pots to be 5 inch ones, and Jawhoo fibre to be used. Unless one's attention had been drawn to it there was nothing to show that the plants were growing
in this new material ; indeed, they were vigoroun, healthy
foliage, and the flowering plants well bloomed.
Another class was for plants in 3 -inch pots and Jadoo fibre instead of soil, and these were very good indeed.

\section*{Cerysanthemums-Cut Blooms.}

In the class for thirty-six Japanese, distinct, the competiIn the class for very close, the Silver Cup and 1st prize eventually falling to Vincent Stuckey, Eiq., Langport (gr., J. L. Lloyd): and the 2nd to W. H. Fowler, Esq., Taunton (gr., Hawkins). Mr. Sruckey's lot, to which Carnot (this flower Nook the prize for the best bloom in the show, though in the opinion of many, a bloom of Robert Owen in Mr. Hammond Spenckr's group (3rd prize) was superior to it). Violet Rose, Mdlle. T. Rey, Nyanza, Lady Saunders, C. H. Payne, G. C. Schwabe, M. Charles Molin, W. G. Newitt, Louise, Go
In the zind prize lot were fine blooms of Madame Carnut, Silver King,
Toulousaine.
Toulousaine.
In the 3 drd
prize group, Hairy Wonder was very good, and Robert Owen was a grand, well-finished bloom, and, as has already been stated, quite equal to, if not superior, to that to which was awarded the prize for the best bloom in the show.
In the eighteen and twelve bloom classes there were some good flowers, nearly all containing some of those abovementioned.
For six white-one variety-the prize went to Madame Carnot, shown by H. Hammond Spercer, Esq., Teignmouth (gr., G. Foster). They were good blums, but uneven as regards size. The \({ }^{\text {Shobrooke Park (gr., Mr. Mairs) for six Beauty of Exmouth, }}\) Shobrooke Park (gr., Mr. Mairs) for six Bea

was 1st with Col. Smith.
Incurveds were poorly represented, the entries being few and the blooms small. In the 1st prize lot-Sir W. H. Walrond, Bart, M.P. (gr., Mr. Heath)-were John Lambert,
Liseley, Prince Alfred, and Baron Lucy K
Hirsch.
Hirsch.
In the anemone-flowered section, Col. Halford Thompson, Teignmouth (gr., Mr. Ssmes) shewed fine blooms of W. Dupenlint, M. C. Leboseqz, Sir Walter Raleigh, and Grande Alveole. The best single flowered were shown by Mark Farrant, Esq., St. Thomas (gr., Mr. Protheroe) Queem of
Singles, Gold Star, Soowfiake, and Mrs. Kellock being noteworthy.
noteworthy.
In the class for twelve Chrysanthemum blooms, distinet, introduced in 1894 or 1895, 1st prize went to V. Stucker, Esq.. who, in a very good lot, included Madane Carnot, Mme. Ant type), Mutual Firiend (a graud white, good in every Way), Ny.uza (a fine dusky, reddish brown), Pailadelphia, Miss
Rita Schroeter, and Mrs. W. J. Godirey.
Taken as a whole, cut blooms were very fine, and the competition keen.

\section*{f'ruit.}

Fruit judging at an Exeter show is always a formidable business, and this year it was rendored doubly ditficult by the large number of entries, sad the nausally bigh quality in nearly every class shown.
In the premier class for twelve dishes dessert, and twelve dishenculnary Apples, all distinct, Sir John F. Davie, Bart., Creedy Park (gr., Mr. Seward), was 1 st with a grand lot, which included Coz's Orange Rippin, American Mother, Rıbstou, King of the Pippins, Adam's Pearmain, Melon Apple,

Lord Derby, Mère de Ménage, and Eciklinville seeding.
In the twelve dishes class, Miss Fripp, Teignmouth (gr., Mr. Stiles) was 1st with a splendid lot, which included Cornish Aromatic, of fine colour, Striped Beefing, Peasgood's Nonsuch, Cox's Pomona, Emperor Alexander, Mere de Menage, King of the Pippins, Warner's King, \&ec, all of which Menage, King of the varieties, and when, as in this case, they are fine exhibition varieties, and when, arge and well coloured, the chances of winning riヶe are large and
The clase for six dishen culinary was a tromendous one, and no finer fruit has been staged at Exeter than that with which Sir J. Davie won the 1st prize. Peesguod's, Cellini, Lord Derloy, and Lady Henniker were very Gne.
The lat prize for mix dishes Dessert Apples was well won by Sir T. D. Acland, Bart., Killerton (gr., Mr. Garland) with very fine fruit of Adam's Pearmalh, Cornish Aromatic, King of the Pippins, Read Ribbed Greening, Blenheim ()range, aul of the Piphins, R'aing
In the single dish classes some wonderfully fine fruit was gtaged. For a dish of any other variety (culinary) th m these named in the sehedule, the prize was awarded to Thomas Wilson, Esq., Pennsylvania, Exeter (gr., Mr. (ross) for a grand dish of Lord Derby-typical fruit-and the prize for five dessert ("other than those named") went for a fine dish of Autumn Pearmain shenn by Sub-Dean Aceand, Broadelyst (gr., Mr. Baker).
The prize for flavour was awarderl to Major Tracey, Pytte Honse (gr., Mr. Clarke) for a dish of small fruits of Margil. Pears, were a strong clase, premier honours fur nine dishessix dessert and three culinary-going to sir T. D. Aciand, 2nd to Sir J. Sheleev. Tue "any other variety -dessert" was won with Marie Louise by W. F. Ru'Hariss, Esq. Broadelyst (gr., Mr. Bawden) ; and the prize for Havour with Doyenné du Comice by sir Dudery Duckworth Kine, Bart. of Wear House (gr., Mr. MeCormick). Mr. Josmph Ham of

Broadelyst a grand dish of Catillac (1st prize) weighing
over 9 lb . for the five fruits, the heaviest being (irapes made a poor show, the only nice erhibit
being the Black Alicante (1st prize) shown by Sir Walrond. Alawick Seedling was also staged fairly This is a variety not much grown in Devonshire, Musats
The Cottugers' Classes produced some very creditableextibite, The thin border line between the employer and the working amateur gave rise to one or two protests, which will hare to be dealt with by the Committee.
The class for baskets of autumn foliage and fruit producod some very pretty designs. The 1st prive basket, thaged by Mrs. M. C. Drayton, being a masterpiece of rich eolonity and artistic arrangement.

\section*{Miscellaneous.}

The Trade exhibits were, as usual, a great help to \(H_{10}\) show. In Messra. Robert Veitce \& Sor's collection vema fine collection of fruit, good Orchids - Cattlega, Phale. nopsis, Sophronites, Pleione, stc. The pretty little Asintpundis ionantha, and the handsome Physalis Franchetiti
The Exeter Nurseries Cu, shewed a bank of Clifsemthemums containing many of the new prieties, all being well grown and full of bloom. In their flomid departmant thes had a wreath and a cross made entroly of Cypl pediums.
Mr. W. J. Godfrex, Exmouth, staged some of his nem Carnations Goldmine, Sunrise, and Reginald Godtrey, and the new Chrysanthemums Clinton Chalfant, golden eeliow; Mrs. W. J. Godfres, a fine broad petalled milly wilith flower : also a fine tand of trusses of Pelargoniums of siderable merit.
Messrs. Jarmair \& Co., Chard, had a collection of Teget ables and Fruit, armongst which were some good speciuens fell-known sorts.
Mr. Chas. Sulater of Heavitree Bridge, and Mr. Wuris Hereford, had large collections of fruit on ahow.
The Rev. J. R. Dumelow, of Membury Parsonaye er hibited three bunches of Black Hamburgh Grapes, which were grown on a south wall in the open air. The bunchas were large, well-coloured, and the berries of a good iiza The Vines were planted six years ago, and the fruit has ripened taree years in succession.
Mr. T. Bartlett, Exeter, had some pretty fioral moriai the way of wreaths and crosses,

\section*{NATIONAL CERYSANTHEMUY}

\section*{Floral Committee.}

November 11.-Judging from the very lare number of new varieties nabmitted for the opiniond the Floral Committee on this occasion, the fiom the tide of novelties appears to wax in volume, for good portion of the northern gallery of the Boju Aquarium was filled with them, and carefan committee may be in the matter of graning ficates, the high quality of ma
Certificates of Merit were a warded to Ewan Camerona, aprax white finely-formed single variety of dwar! growth, ad pos tree, the a ward being made to it as a higaly promilion variety, from Mr. K. С. Goble. Walcot Nursery, white th Wight. 'To Mrs. A. E. Stubbs, also a single pure ming win a fine incurved type, briyht amaranth in colour, wir bil rose and silvery reverse, bro ad petalled, latgy, and fall bin from Mr. H. Joney Ryecroft Nursery, Lamishe m Japanese John Lightloot, delicate lilac-pink, petals suffuser with pink towards the po Heigh,
with purple; and to incurved George from Robert Puttield, pale dull rosy-purple surface, will bhe and gold reverse, large and full, and very promaideal Mr. Robert Owen, Castle Hill Numery, Maidelom fom decorative Japanese Clinton Chaloat, a bright and partaking of the reflexed type, verg brigg pithe plant som promising to make a fine mariet vanne Hoad, very free and excellent for cutting, both from Godfrix, nurseryman, Exmoutb. To Japanad, mawsive, a great acluisition, from masese Arouis the build and in the way of Col. W. B. Smith, bat the petal, and more gold on the reverse, Hill, gular to state, among some new varieties eand like Mr. Ironside's Arona, but with searcely on the reverse, thus illustrating the fact thas very
apart geographically, may yet raise sedlings vien and in all probsbility both will bo send also to Ja
H. Hicks, a magnificent variety, of which men shown, the largest, a mazaive flilacopink, the - astra fine. Pompon Dolly, a rather large raniety, with handsome, well-forme Chenon de I large reflezed Japaneese, the cianamon, with golden centre, and golder poin yellowala -very distinct and fine, fint, the lightly atnined of to Very pleam Bubrieres,
pink, with silvery-white reverse, a fine full flower-all from Mr. Willism Welis, Earlewood Nurseries, Red Hill. To Mr. William Welis, Earlswood Nurseries, Rod Hill. To
incurved Major Bonafion, bright yellow, with plenty of small petals symmetrically arranged - a very promisiog exhibition variety, from Mr. W. Mense, The Gardens, Downside, Leatherhead. This was shown by three other exhibitors also.
Of flowers of decided promise, and which are pretty oertain to guin Cartificates in the future, mention may be made of incurved L'Amethyste (W. H. LEES), bright amaranth, with silvery-roee reverse, a distinct and highly promising varioty ; Harold Wells (W. Wells), a large incurved sulphur sport from Sir Trevor Lawrence, very promising; Mrs. C. Johnson ( \(W\). WELLS), pale ground, the long reflexing pale florets flaked and striped with rosy crimsoo, distinct and novel; incurved Mre. Hepper, white, fine form and good petal; and Mrs. Filkine, a Emall bright yellow decorative Japanese, with thread-like petals-both from Mesers. H. CAmmell \& Sows : Mrs. W. J. Godfrey, a large, white, broad-petalled incurviDg Mrs. W. J. Godfrey, a harge, whita, broad-petallod incurving
Japanese with olight hairs; and Mayor of Ermouth, norel in co:our, of a kind of pale cerise, chestnut bronzy reverse - both from Mr. W. J. Godprey, Exmouth; and Mise Madeline Davis, a silvery-pink Japanese, with long incurving florets, though some what loose, from Mr. H. Weris.

\section*{WINDSOR.}

November 8.-A pretty exhibition of the Chryaanthemam and other anbjecta was held in the Albert Intitute at Windsor, on the above date. Chrysanthemum plant were arranged in groopt, and made a huge dieplay; the quality of the blooms to be a chief point.
Mro. E. B. Foster. Clener Manot (Pro, Mr. Cole), took the lst prize; and Lord Boston, Hodsor Parl (gr., Mr. J. Wood), the 2nd.
Specimen plants were excellient; the best four coming from Mra Bowrivg, Ascot (gro, Mr. Paul), who-e plants wore
6 feet in diameter and well flowered ; and Sir H. D. Goocr, 6 fart., Clewer Park (gr.o Mr Skeet), was 2nd, with wellgrown, standard-trained planta
Amateur caltivators showed in strong force in the twelve p'anta' class, there being no fewer than nine competitors. The lst prize went to MP. H. EDWARDS, Windsor, for an excellent exhibit.
Cut blooms, of fine qdality, were staged in large numbers ; and for thirty-sir distinct, half to be Japanese, and hale incurved varietier, N. S. Cohen. Eby, Englefield Green (gr.,
\(\mathrm{Mr}_{\mathrm{r}}\) A. Sturt), succeeded in winning the lst pace with handMr. A. Sturt), succeeded in winning the list pace with hand-
some blooms of lèding varieties; Mass A. N. RIDGE, Higho some blooms of lexding varieties; Mass A. Ns. RLDG
field, Englefield Green (gro, Mr. G. Lane), bing 2nd. A Challenge Cup, with a good money-prize, was offered for twelve incurved and twelve Japanese varieties, which Mr. lane won with remarkably fine blooms; Mr. A. STUBT being \({ }^{a}\) good 2 nd .
For twelve incurved, Mr. F. J. Paul won the premier place with a meritorious exhibit.
For six Japanese, any one variety, Mr. CAWTr, Dedworth Green, was lst, with E. Molyneur. Anemone-flowered varioties were very well shown by Mr, A. STURT. Mr. W. Neate, gr. to Miss MaCKEr, Ascot, was list for twalve blooms of the reflexed varieties.
Special prizes were offered for a vase or basket of twelve blooms cut with long stems, and in response there were seven really meritorious eshibits, which well showed the value of the Chrysanthemum when used in this mander. Mr. Cawte Was 1st, with a device consisting of a neatly-covered circular
basket, set out with Ferns, moss, \&c.; Mr. J. Wood was 2nd. The exhibits of Grapes, Applee, and Pears were of much merit, and vegetables were largely exhibited.

\section*{TOOTING, BALHAM, AND MITCHAM HORTICOLTURAL}

November 8. - Thie Society may be congratulated upon holding a very pretty exbibition on the above date, which took place in the Baths, the pacions hall being quite filled with many otjects of great horticultural intereat, as in addition 60 Coryanthemums there were several specimen of plants in bloom at the preant time, alaotraitand vegetables. Groupa of plante foard a place round the aidea of the Hall, and the frait and cat flowers on tables. There were several baskts of vegetables-not a good way of thowing them, an they would appear to greater advantage if neatly laid out on ordinary extivition table.
The beet group of Chrgsanthemums, which won the Silver Cup given by the tradesmen of Balham, came from Mr. H. roalton, gr. to C. F. Caler, E q., Lvy Moust; the blooms Very fine, but sadly nee ling the relief of some foliaged plants toreduce the packed appearancs of the group. A group from Mr. H. Beckett, gr. to G. 8. Miller, Ekq., Logie Wood, ran it rery close indeed in point of quality and effect. Some pleasing groups of foliaged plants were also staged; and some wellgrowa and blowmed epecimens of largeflowering and Pompon Chrysanthemums came from Mr. E. Cherby, which were awarded lst prize.
The Silver Cup given by the tradesmes of Tosting for twelve incurved and twelve Japanese Chrysantheraume, fell to the lot of Mr. W. Howe, gr. to H. TıTE, Rsq, Streatham, who had gead blooms of Empres Eugénie, Baron Hirscb, Empreas of Indis, Bobert Petfeld, and Pricen Ahfod; and of Japanese, K .

Molyneux Col. W. B. Smith W. Sewand, Dake of York Golden Gate, and Visconatees Exambledon. J. Wild 4 An Req. Was 2nd, having a slight pull in the incurved blooms, but loaing materially in the quality of the Japanese. Mr. Wild. Man had the beet twelve incurved: Mp. Howe coming lat with twelve Japanese. Sizes of incurved and Japanese were also well shown. Some gord bunches of Pompons were showa by Mr. E. Ceerry.
At each end of the hall was a large table filled with floral decorations, showing the manner in which flowers may bo anployed. The compatition was a epeciel opanclaes. Tue let prize was awarded to Mesans. Harwood Bros, for contributions of a very high crder of merit, showing not only ercellent tasto and judgment in arrangoment, but perfect esecution. Wraaths, croses, a charming lyre, bouquets, shower bouquet of white flowars, and an ordinary bouquet of Orchide, were spocially good. The 2ad prize went to Mr. G. B. Fiscris. of Clapham; but the flopal decorations were epare. and what there was fell far bslow those of the Mesars.
Harwood in print of quality.
Excellent Exotic Yerns in
table plante, berried plants
Frulante, berried plants, ac.
Fruit was reprosented by good Apples and Peare; Tomato were also staged. Messrs. Sutton \& Sons' apecial prizes for six sinds of vegetalles; and those of Mengrs. Harwoon Bros, for the same number, brought good collections. Unfor tunately, the weather was somewhat uapropitious.
Misceltaneous groups of plants were contributed by Messrs. Harwood Bros. Balham Nurseries; B. Peen a Son, Roupell Parl Nurseries; and R. Nral, The Nurseries, Wandsworth, who had two large groupe, and there were smaller contribu tions; to all these Certificates of Merit were awarded.

The term "accumulated temperature" indicat. the aggre gato amount, as well as the duration, of degrees of temperature above of below \(4 c^{\circ}\) Fahr, for the period named: and this combined result is expreseed in Day. degrees - a "Day-degree" ignifjiog \(2^{\circ}\) continued for twenty-four hours, or any other number of degrees for and proportional number of hours.]

\section*{THE PASTWEEK}

The following summary record of the weather throughoat the Britiah Islands for the weel ending November 9 , is furnished from the Meteorological Office:
" The soeather during this period wis very unnettled in all parta of the Kingdom. Rain fell slmest daily, the amounts in many instances being large. The atmosphere wes menerally mild and humid, and much mist and wet fog prevailed a times. A brilliant display of aurora was cbuerved over Great Britain during the evening of the 9 th.
"The temperature just equalled the mean in "Fcotimed, N . and E. and in Ireland, S., but whe abowe it elvewhert; in 'England. E, aud the Midland Counties,' the excess was \({ }^{\circ}\); in the 'Channel Iolands.' 50 : and in 'Eugland, \(\mathrm{S} .{ }^{3} 6^{\circ}\). The higheat of the maxima were reconded either on the fth or

Th, and ranged lroa \(69^{\circ}\) in the 'Chananl Ialanda, \(62^{\circ}\) in
 "Irelond, \(M\) !' The lowet of the mieime were mgictertd, a a rule, on the 3rd, when the thermometer foll to \(21^{\circ}\) in "Boolluad, N. and E.,' and \(23^{\circ}\) in 'Irelend, 8.0 and to botwoea \(27^{\circ}\) and \(32^{\circ}\) in noarly all other diotricta. In the "Chas me! Idende" howerer, the lowent reeding wat \(40^{\circ}\).
-The rainfal was conaiderably in excom of the sean in most dietricts, but only juet equalled the normal in ' feothad. K, and Eugland, N.E." and wao rather ien in ' Eagland, N.W. 8 the ex cose was very large in mont parth of Englaed.
" The bright sunshime was much less preveleat than of lete ovar • England and the Chanpel Ialadn, whare the amouat recorded was leas than the normal. The percentage of the poseible duration ranged froce 97 to 41 in Iroland, from is to 26 in 8ootland, and from o to \(8 \%\) over Rogisnd. In tie Chanmel Lalande ouly 16 per eont wee registered."

Mr. James Adshead has taken over the nursery and florist business of James Firkins, Albert Narsery, Eccler, and which will in fatare be known as Adshead \& Henshall's.

** Owing to the great pressure on our space, several reprets of Horticutural Exhilitions cannot appear in this issue.
Address: H. O. D. M. A. Alegatière. Chemin de la Cruix, Marion, Montplaisir, Lyon (Rhone).
Booss: Encyclopadia. Nicholson's Dictionary, pub. lished by Upcust Gill, 170, Strand, is a vary useful encyclorz ia for a gardener to possess. We do not know the price of tha bound volumes.-J. Dobson. Vines and Vine Culture, by A. F. Barron. poblished at 171. Fleet Sireet, E.C. (Journal of Horticulture). Animals of the Farm in Hoalth and Diseare. a pamphlet of 68 pages, to be obtained at the Roval Agricaltural Society of England's House, 12 Hanover Square, Landon, W.-S. E. J. Chrysanthemums and their Culture 8 h Etition, by Edwin Mulypux, pobirhad at 171 Fleet Street E C. - My Gardoner, by W. H. Ward, published by Egre \& Sootiamode, Fat Harding Street, E.C. or Tilla Gardening by E. Hobdsy, pablished by Macmillan \& Co., Bedford Street, Covent Gardev, W.C., the former being the newer book.-A larger ad more expensive work in the Gardeners' Assistant, by R. Thomaon, published by Biackie \& Sons, Paternoster Baildinge, London, E C.
Best Roses for "Buttor-holes": Beginner. There are not filty best batton-bile Roses. W. Allan Richardeon, Ma Capacine, Devonensis, Niphetow, Máchal Niel, Toe Bride, Hapmoa, A K. Williame are amnng the best. See also p. 497 n Gardeners' Chronicle for Oatobur 26 last. We cannot affird opace for maming fifty tine varietiea for the garden. You must conoult a catalogue published by some good Rose grower.
Cattleya labiata mite new Roots forming and swalling Leads: \(D G\). K ep themgenciy moving in a semperatare, which at night is not leas than \(60^{\circ}\), or by day higher than \(68^{\circ}\) or \(70^{\circ}\). Toe same will hold sood for these C. Monsses which are in \(s\) forward atate.
Catifirya Tanami D, G. Being newly imported, arcer trimeing way dead parta and thoroughly washing every part, put them loowely into pots of a suitable vix, surrounding the roota with clean crocte: place in a warm, nolat hotuls, and occe-
sionally tyringe them. The minimum temperature need not be less than \(60^{\circ}\). When root growth becomes visible, pot them in the usual manner, and whilst inert the sun should not be allowed to shine directly apon them.
Chrysanthemom Sport: S.S.S. The bloom you send mas bave a little more colour than Source d'Or usually has, bat we do not regard it as valuable.
Chrysanthemum Sport: \(W\). Gee. The variety Chre. Davis is asually yellow on the crown bad, but we do not recognise the bloom you send as that variety, though it is near it. In case it may be a port, and bloom to the next Fioral Committee of the National Chrysanthemum Society, or to the Royal Horticultaral Society, or even to some large grower.
Dendrobium Wardianum: D.G. It should improve and grow larger, your treatment cannot be quite right.
Dressina for Vines: \(T\). \(B\). Clay, a bucketful; cowdung, quarter of this quantity; gair-tar, one pint; soot and sulphar, a handful or two, adding water sufficient to make a thickinh mixtare. Strain through a fine sieve before using it. If tar be not liked ute petroleum, at the rate of two wineglannfuls, instead of it. The mixture must be applied when the Vines are at rest.
Eucharis: Wm. G. We know of no remedy when the mites have gained access to the interior of the balbs. Had the attack been commencing only, you might have soaked the bulba in nicotine, or a atrong solution of soot water, soap, and paraffin.
Eucharis-Mite: Wm. \(G\). Your bulbe are attacked by mite, but not at present to great extent. The bulbs being perfectly sound, it may be possible to keep them, if energetic measure are trien at once.
Gardeniss: T. W. Peat, \(\frac{1}{2}\); fibry loam, one year in stack, \(\frac{1}{4}\); leaf mould, \(\frac{1}{4}\); and sand in mafficient quantily to make it rather porous. Some garceners nee a larger proportion of loam if it is of a light nature, and broken sandatone is found to be of use, together with and in making border for the plants. It is a plant that require firm potting and plenty of drainage materials.
Gardeners' Orpann Fund - W. Hunt has thankifor 48. formarded to the secretary to this fand.

Hardy Himalayan Rhododendrons: F. S. At Kew there bloomed R. fulgens, R. Thomsoni, R. duburicum, \(R\). alta-clarense. At Nant-y-G/yn, R. eximiam, R. cinnamomeum, R. campanulatum, and alta-clarenee, flowered in the opan air. See pD. 356 and 363 of Gardeners' Chronicle, March 25 1893
Houlletia picta: \(W\). M. An inepection of the \(^{\text {. An }}\) names of plauts on p. 470 would have hown you that the plant had been noticed, and the name altered to H. Brocklebankiana.
Imported Lelia and Cattleya: D. G. If you prefer to bay knowing what you are getting, make visits Lo the sale room when flowering lots are advertised. Otherwise put reliance in the Orchid dealer, and buy eatablished planta which have flowered or of which he can guarantee the apecies. There in an element of chance, that is not unpleasant to many permons, in buying up unflowered lot..
Inswets: J. L. Grubs of the common cockchafer, mall variety. Eucourage the rooks,
Laws Sand: Subecriber. Thone who have ueed this aborace speak highly of it. We imagine it is some kind of artificial manare, which, by encouraging the growth of the grasese, causes in time the destruction of the weed which even in bad tarf are in the minority.
Maize: T. S. The presence of a few grains on the male influreacpnce of this plant is not uncommon, and it is an undesirable malformation.
Moshroom Buds: G. L. B. L. To all your questions we can only answer " \(N\) o." The productivenens of an old bed map be revived nomewhat, if it have not quite left off bearing, ho watering it with warm water-say, at \(85^{\circ}\) to \(90^{\circ}\)-in which a little salt, at the rate of wo tatue-spooniula to three gallons, is dissolved.
Names of Peante: Conmpondents not ansidered in this isouse are requected to con wit the mext number. Mrs. Lo, Gopted Hall Seeds of the Black Walnat (Juglana nuna).-Lintaba, Oncidam longipes.

CHRYSANTHEMOIIS. - CHRYSAMHEMWUIS.
}

\section*{NORMAN DAVIS}
beGs to say his preliminary list of chrysanthemums is now ready. This is a carefully-prepared Alphabetical List of the orem of recent introductions, so far as in commerce, free from sensational and unnenosary long demoriptions. It will be found a useful list for reference: sent pont-free.

\section*{SPECIAL NOTICE.- GRAND NATIONAL JUBILEE SET OF NOVELTIES.}

Soon as the shows are over I shall prepare a LIST of NOVELTIES for 18\%0. This List will he a short one, an I am anxious that the set shall be composed of nothing but back row flowers of the choicest description. Several of my purchases have already been shown in public, and removed unanimous approval. In addition to the beautiful varieties raised by Mr. H. Weeks, of Derby, and two exceptional sterling Novelties from America, it is with great pleasure that I am able to announce that I have made arrangements with Whumam Seward, Esq. of Hanwell, to distribute his set of six magnificent seedlings, which have justly been the admiration of all who have been privileged to see them. The whole of these will form a grand utile set, worthy of the occasion, and undoubtedly the finest collection of Novelties ever introduced.

\section*{PROSPECTUS.}

The Company has been formed to acquire and carry on the established business of Mr Wh. Arthle DawniNs (known as W. A Dawkms \& Co.), Manufacturers of Photographic Cameras and Apparatus, Optical and Lime-light Lanterns, Horticultural Apparatus and Garden specialities, and etroleum Lamps, and General carried on at 58, Caroline Street, Birmingham, and at the Wholesale and Apparatu8, now carried on at 58, Caroine street, Birmingham, and at depot, 40, Edinund Street, Birmingham, including the following Patent Rights:
1) An invention in and relating to Petroleum Lamps, granted to Thomas William Wilson and Harry Butler jointly, on 8th March, 1892, and numbered 4,583, and contracted to be sold to the Vendor.
(2) An invention in and relating to Garden Syringes, entitled "Improvement in Syringes," the acceptance of the complete spe
21st September, 1895 , and numbered 11,502 .
(3) An invention for improvements in and relating to Photographic Cameras, granted to
the Vendor 22ad June, 1894, and numbered 12,119.
It will be seen that the business comprises three distinct departments: (1) Manufacture of Photographic and Optical Lanternl Apparatus and Accessories; (2) Manufacture of Horti cultural Implements; (3) Manuftcture of Lamps, and for every four shares to his or her annum at special discounts, varying from 10 per cent. to 30 per cent., according to the nature
of the goods purchased, the higher rates of discount being allowed on goods manufactured by the Company.
Tho successful working of the principle of mutual benefit to shareholders has been proved, as is well knuwn, by the wonderful strides made during the past decade by Cooperative Societies in all liranches of trade, and the business of this Company is one admirably Horticultural Apparatus will he sent annually to Sharehulders.

The enormous increase in the use of the Phutographic Camera as a popular companion by mateurs and tourists, aided by the present day faclities for cheap Railwas Tours and Excursions, leads the Directors to believe that the trade produced by the dernands for this class Cameras annually, while a large demand may be expected for the Optical or Magic Lantern by patrous of the Camera as a means of showing their photograpins during the winter venings.
 turing profits, and at the same time to save the cousiderable profits hitherto solely enjoyed yagents and middlemen.

The Directors have also decided to add to the already extensive Lantern-Slide Lending and Hiring Lepartment opened by the Yendor a complete set of popular ancient and modern subjects, tours, and humorous slides of high-class quality. The Shareholders will be entitied hire slides and apparatus at two-thirds of the rate charged to the public.

In the Horticultural Department, also of the Company's business, it is anticipated that there will be a large annual demand for Horticultural Specialities among the Shareholders. The Patent Syringe is already well known to many amateur gardeners, and in connection with this and other distributing apparatus the Company have aequired the formula of a reliable speciality, well known as "Garden Pest Exterminator," and which has for some time past been manufactured and supplied by the Vendor. For the convenience of Share The Directors beg to call special attention to the princluples high-class Garden Seeds.
Thans Petroleum Safety Lamps, an illustration of which accompanies this prospectuis the Patent secen that the object is to provide an inoproved means of attachment of the burner to the vessel containing the oil by means of a straight guide, at the end of which is a bold coupling screw, which reuders cross-screwing in attaclment impossible, and forms a securely locked joint. In case of any accident or upsetting of the lamp the burner retains its relative position, and any possibility of explosion or fire is prevented. Users of letroleum Lamps will have doubtless observed that ordinary Lamps of present make are provided with a connection of burner with vessel by means of cither a small tapered screw or side catches. In the former case the great disadvantage is that the frequent crossing of thread or screw deceives the
operator, as the screw dues not engage and no proper connection is therefore made, and by operator, as the screw does not engage and no proper connection is therefore made, and by
frequent repetitions of this process the thread is ultimately destroyed. If under such circumfrequent repetitions of this process the thread is ultirnately destroyed. If under such circum-
stances the Lamp by any means be unset the burner immediately separates from the vessel stancas the Lamp by any means be unset the burner immediately separates from the vessel and the lighted wick ignites the spilled oil, and this is the cause of the majority of Lamp twhile one catch is being watched in con, side catches, is even more uncertain, as frequently while one catch is being watched in connection, the other unobserved fails to grip, and leaves no atternative but a certain catastrophe in case of upsetting, and rendors explosion by igmiits aimplicity and consequent cheapness in of the Improved Safety Connection principle are absolute safety. This Lamp has been exhibited at two Exhibitions in manipulation, and its following nwards-(1) Certificate of Merit, at the Trades' Industrial Exhibitiond has gained the Spring. 1s92: (2) First Prize. Gold Jedal at Trades' Industrial Exhibition at Lincoln, December, 1892, and January, 1893.
The Vendor has sunber
The Vendor has submitted the Patent Specification to Mr. J. Fletcher Moulton Q.C, the eminent authority on Patent law, for his opinion as to the validity of the Patent. The follow. I am of opinion pinion:-
nature of the invention the title to the Patent, N0. 4,583, of 1892, sufficiently discloses the Specification refer to tho same the Title, the Provisionul Specification, and the Complete aesuming that the finvention is new, I , that the Specifcation and claims are sufficient, and (Signed) J. FLETCEER MOULTON (Templo).

The Directors anticipate large and substantial returns from the manufacture of tiin Lamp, and also from grants of Liceuces to manufacturers under the Company's Pitank of lamps have been offered for sale by retail, and the result of the Vendor's experimenti this direction whs highly satisfactory.

The Vendor finds that to reap the full benefit of the Patent, labour-saving tools mat \(x\) procured, and this his limited capital will not enable him to do. He has, however, arpeadis considerable time and money in developing the manufacture of the Limp, and nois
been designed by him which will reduce the cost of manufacture to a minimum. Hisgene been designed by him which will reduce the cost of manufacture to a minimum. Higgena
business is now also ripe for further development, and will well warrant the introductiand business is now
further capital,
The Plant, Stock-in-Trade, Fixtures, Manufacturing Machinery and Tools, bave bue valued by Mr. T. B. Fallows (Ex-Mayor of Birmingham), who reports as follows:-
59, Temple Row, Birmingham, 27 th Septomber, 1206

Dear Sirs: Street, Birmingham, and have taken in detail a complete inventory of the whole d \(\mathrm{f}^{\mathrm{m}} \mathrm{m}\) finished and unfinished Stuck-in-Trade, Plant, Machinery, Tools, Patterns, Shop, Olita, ex Warehouse Furniture and Fixtures, and have made a careful valuation of the same i the value of the whole, taken as a going concern, amounts to
Hundred and Seventy Pounds One shilling and Threepence.

Messrs, W. A. Dawkins \& Co. \({ }^{-}\).
Photographic Instrument Makers, Edmund Street, Birmingham. Patent expert, who reports as follows :-

Dear Sir, \(\qquad\) In accordance with your instructio, Lord Street, Liverpoo, nin the Pitant 4,583, of 1892 I underotand from you thio tating against its novelty has beeu discovered. Assuming, therefore, the novelth invention, and as far as I can judge it is new, I am of opinion that the Patent is mupent covers the invention claimed. I also think the invention a good one for the these which it has been designed, and that 3 . Would be a fair Royalty to pay profits owiop tit On the basis of this Royalty, and a reasonable valuation for extra trade proits 1 under
monopoly, I should value the Patent at \(£ 3,260\). The American Patent, which monopoly, I should value the Patent at \(\mathcal{£ 3 , 2 6 0}\).
has now been applied for, should also be very \(v\)
or the Syringe and your Photographic Camera at \(\mathcal{L} 180\).
W. A. Dawkins, Esa,
street, Birmingham.
Youra truls, WM. P. THOMP905.
The total purchase price fized by the \(V\)
tent and other rights (including the Lamp) is for the Plant, Machinery, Stook in Ind £ 600 in fully paid up shares.

The Directors have secured the services of Mr. Wm. Arthur Dawkins, the Yemer, Managing Director for a period of five years, upou terms mentioned in aul agreeam for the 6 th day of November, 1895, and made between John Henry Smith, as Trusther pat behalf of the Company of the one part, and the said W. A. Dawkins of the onetion mit his agreement of sae the existimg Patents that he n

Awarded First-clans Certificate of Merit.

\section*{GLOXINIA, "AICBURTH CRIMSON."}

THIS is the finest high-coloured variety ever sent out. As ite name indicates, it is a vivid-crimson self, of the highest merit. The flowars are arsot, of the fineet form and substance, of great aixe, and abandantly produced; the habit of the plant fis all that could be deatived.
This charming variety was raised in our Mursery in 1803, and was exhibited for the first time at the Liverpool summer Show, August, 1894, and was much admired by all who \(=\) wit, and was unmimously awarded a First-clase Certificute of Merit.
Having proved that it io reprodeced quite true from seeds. we now offer Seeds from carufully-fertiliod towers at 23. 6d. per packet, pont-fres.
Liberal terms for this aterling novelty, per dozen or per 100 packets, to the Trade, from Measr. NUTTIKG axd SONS, Mesmes. HURST ATD SON, London; or of the Raisers-

\section*{RESULT}

Proves more than volumes of print. My Collection of Chrysanthemums has again succeeded in winning the President's Prize for Group of Plants, and the Gold Medal for Table of Exhibition Blooms, at the National Chrysanthemum Society's Show, November 5, 1895. In addition to many other prizes my collection has now been awarded

\section*{5 GOLD MEDALS}
in two jears-the highest award obtainable in each case. I have much pleasure in announcing that I have secured some Grand Seedlings from our two most noted and successful English raiser, Chis. E. Shea, Esq., and H. Briscoe-Ironside, Esq., which, together with my own Seedlings will form a collection

\section*{UNRIVALLED.}

My GENERAL GUIDE is now ready, with reduced prices for all last season's novelties, and contains the following Cultural Articles:-How to Grow Japanese for Exhibition; How to Grow Inourved for Exhibition; How to Grow Specimen Plants; How to Grow for Decoration; How to Dress Incarved for Exhibition; and How to Save Seed. A large number of Growers attribute their

\section*{SUCCESS}
to following the advice given in my Guide, which can be obtained, post-free, for eight stamps. My LIST of NOVELTIES for 1896 will be ready in December H. J. JONES,

RYECROFT NURSERY, LEWISHAM, STE.
THE BEST \& CHEAPEST FUEL for GREENHOUSE BOILERS, STOVES, \& HEATING APPARTITS.

\section*{CHRYSANTHEMUMS.}

\section*{ALL GROWERS WHO DESIRE THE BEST VARIETIES ONLY} should obtain a copy of W. J. COODFRE'S CATALOOUE.
It is the MOst RELIABLE LIST published. (Ready early in December).
Before the blooming season bardly began, Catalogues for 1896 were distributed containing long lists of Foreign Novelties, with descriptions appended, as supplied by the various raisers. Not a tenth part of these had bloomed in this country, and not one in twenty will be worth cataloguing another season. Those growers who are tempted into trying them will be sorely disappointed.
W. J. G. has on trial of this season's Novelties 220 varieties from Continental raisers, 76 from America and Japan, all the English introductions, and several hundred second-year seedlings of his own raising. ONLY THE VERY BEST of these will be oatalogued, and no expense and trouble are being spared to s.ft the few "grains from the chaff." Strong, healthy, country-grown outtings can be supplied at once, if desired, and at same prioes as offered by other responsible firms.
 W. J. GODFREY, EXMOUTH, DEVON.

We beg to inform all readers of thls Paper that the Fourth Edition ( 100.000 coples) of our Revised PRICE LIST, conststing of 400 pp . and about 1200 Illustrations, bound in cloth, in Now Ready. We shall have much pleasure in forwaraing to every person one post-free on application. This List is the most complete in the Trade, and has cost several thousand pounds to produce.

\section*{CONTENTS OF SECTIONS.} storion.

\title{
W. W. JOHNSON \& SON,
} SEED GROWERS and MERCHANTS,

\author{
BOSTON, LINCOLNSHIRE.
}

\title{
NEW PEA, \\ " BOSTON UNRIVALLED."
}

A NEW, PERFECTLY DISTINCT, and VALUABLE ACQUISITION.
An unusually prolific, dwarf, wrinkled, Second Early Marrowfat, of the best table quality. Height, \(2 \frac{2}{2}\) to 3 feet; pods large, 5 to 6 inches in length, of the "Telephone" shape and colour, but more even in size than that well-known variety, there being from 9 to 11 fine peas in the pods. These mostly hang in pairs, literally covering the haulm, which is robust, and not subject to mildew.

A first-class Pea for either Private Gardens or Market Growers, and as an Exhibition variety must rank as a decided improvement and great acquisition in profitable Horticulture.

> Retail, per Sealed Half-pint Packet, 1s. 6d.; per Sealed Pint Packet, 2s. 6d. Trade Price and List of Testimonials on application.

\section*{FRUIT TREES A SPECIALTY.}

\section*{Strawberries.}

ROYAL SOVEREIGN - The best Strawberry grown. special quotations for large quantities. Also all the best of the New and Old Varieties. including
Competitor, Sensation, A. 1, Allan's New Ones, \&c. Competitor, sensasion, \(\mathbf{A}\), Alan' Now Ones, \&c.
FRUIT TREES of all sorts, in all forms. Send for Descriptive Catalogue.
JOHN WATKINS,
POMONA FARM NURSERIES. WITHIVGTON, HEBEFORD.

GRAPE VINES AND ROSES: JOHN COWAN and CO.
Have this season a large and splendid stock of Grape Vines suitable for Fruiting in Pots and Planting Vineries. Also e Descriptive and Priced CATALOGUE post-free on spplican tion to the Company-
The Vineyard and Nurseries, Garston, near Liverpool.

\section*{FERNS-FERNS-FERNS.}

30,000 P. CRISTATA in thumbs, good, 1000. Price clean, and free, at 32s. per 100 , or 25 per 32"s on application. Inspection invited. Fres in \(48^{\prime \prime}\) and 33's on application, Inspection invited. Free on rail in
London.-J. HILL, Nurseryman, Lower Edmonton, Middlesex.

FRUIT TREES AND ROSES.
A LARGE AND SELECT stock is Now OFFERED FOR SALE.
The Illustrated and Descriptive Catalogue of Fruits and Roses, post-free, \(3 d\).
Winners of the Royal Horticultural society's Gold Modah 1893, "94, and '95; also at Manchester and Liverpool.

THOMAS RIVERS \& SON, TGE NURBERIES, SAWBRIDGEWORTH, HEBTS Station, harlow, G.er.

\section*{CHRYSAMHEMUNSS - CHRYSANTHEMUUIS}

\section*{NORMAN DAVIS}

BEGS TO SAY HIS PRELIMINARY LIST OF CHRYSANTHEMUMS IS NOW READY. This is a carefully-prepared Alphabetical List of the cream of recent introductions, so far as in commerce, free from sensational and unnecessary long descriptions. It will be found a useful List for reference; sent post-free.

\section*{SPECIAL NOTICE.- GRAND NATIONAL JUBILEE SET OF NOVELTIES.}

Soon as the shows are over I shall prepare a LIST of NOVELTIES for 1896. This List will be a short one, as I am anxious that the set shall be composed of nothing but back row flowers of the choicest description. Sereral of my parchases have already been shown in public, and reoived unanimous approval. In addition to the beantiful varieties raised by Mr. H. Wreks, of Derby, and two exceptional sterling Novelties from Americh it is with great pleasure that I am able to annoupce that I have made arrangements with Wirciam Seward, Esq. of Hanwell, to distribate his get of six magnificent seedlings, which have justly been the admiration of all who have been privileged to see them. The whole of these will form agrabd Jubilee set, worthy of the ocossion, and undoubtedly the finest oolleotion of Novelties ever introduced.

\section*{PLANTING SEASON}

PAUL'S NURSERIES, Waltham Cross, Herts. to Her Majesty The Quren, Tree, Plant, Bülb and seed Merchants. Close to Waitham Crose and Theobald's Grove stations. G.E.R.
PaUlis' NURSERIEs, Waltham Cross, Herts. - Standard and halestandard muses, from \(188^{\circ}\) per dozen ; Dwarf, from 6s. per dozen; Climbera, from 68. per

\section*{THE LATENT VITALITY OF SEEDS}

M.CASIMIR DE CANDOLLE has lately - pablished an interesting paper entitled La Vic Latente des Graines (Arohives den So. Phys, et Nat.; Bibl. Univers., 1895), in which be comes to the conclusion that if the external conditions necessary for the vital activities of seeds be absent for a long time they may be totally arrested, but yet the seeds may be alive and reenter an active course of existence after, perhaps, an indefinite period. His experiments were conducted in a cold room of a meat refrigerator, having made a preliminary one as follows:Three lots of Peas and Haricot Beans were placed (1) in free air; (2) in a tube of air, but sealed; (3) in pure carbonic acid. After two years (1) had increased in weight, and nearly all germinated; (2) had lost weight, while a smaller proportion germinated; air now containing 11 . per cent. of orygen, and 3.8 per cent. of carbonic acid; (3) none came ap. He asks the question whether the enfeebled vital activities had ceased before the end of the experiment, so that respiration and assimilation had completely stopped; if so, the protoplasm mast beoome quite inert. He believes that to be the case. He now experimented with an intensely cold temperature, having previously determined that Peas, Haricots, and Fennel seed would germinate after an exposure of four days to a temperatare of \(148^{\circ} \mathbf{F}\). He wrapped up some Wheat, Oata, meeds of Fennel, of the Sensitive plant, and of Lobelia Erinus in tin foil. All were well packed in a cylindrical iron box of \(3 \frac{2}{2}\) oubic feet capacity; the lid being hermetioally sealed. This was placed in an open wooden box for protection. The whole was subjected to an intermittent stream of intensely oold air coming direct from the refrigerator, from May to September, 1894, or 118 days.

The cold air was continued from eight to twenty hours per day; the average time being fourteen hours. On the greatest namber of occasions (sixty-eight times), the cold was prolonged for twenty hours. The lowest temperature reached was \(-65^{\circ} \mathrm{F}\), and the highest \(-36^{\circ} \mathrm{F}\).

In the intermediate periods the warming was very slow, for the temperatare moaroely passed freezing-point at the ead of two to three hours, after atopping the machine. Convernely, the oooling of the box was very rapid, as it was directly exposed to the current of cold air.
M. De Candolle asks the question whether the box could oheok the cooling. As an experiment in this direotion, he completely filled a box with oorn. The lid, being hermetically sealed, was then pierced to allow the bult of a thermometer to pass through it, and the hole was then nlagged with cotton-wool. He then observal the thermometer outside a window. The rate of cooling varied much according to the initial tem-
peratures, and in proportion as the exterior air was calm or agitated. Thas, in a strong north-east wind, the temperature of the room being \(18^{\circ}\) Fahr., and \(17.5^{\circ}\) Fahr. outside, it took twentysix minutes to ascend to \(21^{\circ}\) Fahr. On a calm day when it was \(53.6^{\circ}\) Fahr. in the room, and at freezing point outside, it took one hour and eight minutes to descend to freezing point.

But, as M. De Candolle observes, this experiment does not bear much, if any, analogy to the cooling by the air from a refrigerator, for the box was placed in the direct current from it. Moreover the seeds were surrounded by a metallic paper, greatly facilitating the conduotibility of the bor. He thinke, therefore, that not more than a quarter of an hour would be required to put the temperature of the box in equilibrium with that of the oold air. On taking out the seeds, they were at onoe sown. Nearly all the Wheat, some of the Oats, and some Fennel seeds quickly appeared. Of sixtysix seeds of the Sensitive plant, thirteen only came np; while of numerons Lobelia seeds, only ten germinated.
The failure of the seeds of the Sensitive plant was not solely due to the cold, as many failed to germinate, while many Lobelia plants grew in a control experiment. The conolusion the anthor arrived at was that life, as expressed by vital functions, was completely arrested for a time; the protoplasm was inert, and could not either respire or assimilate. The cause of some being killed was that their protoplasm had not yet become completely inert.

If this result be true, then, one would expect that seeds could be maintained with impunity in a medium unsuitable for respiration, provided there were nothing whioh could exert a deteriorating effect upon the internal ohemical prooesses, as does osrbonio soid.

He , therefore, tried the effect of plunging seeds in mercury: thas, 8 grains of Wheat were placed below 2.5 em . of meroury for one month (October 19 to November 19). Of these four only germinated. Of 5 grains of Wheat under 13 cm . of meroury, from November 27 to Deoember 28, four grew. Of 5 grains of Whest ander 5 om . of meroury, from February 5 to May 5, all grew. Similarly 13 grains of Cress, ander 5 om of mercury, for two months, all germinated.
This experiment, therefore, as that with a low temperature, shows that seeds oan exist in a state of complete vital inertia; and that the internal changes of metabolism can be arrested, as long as the necessary external conditions of temperature, moisture, \&c., are withheld.
M. De Candolle thinks that this state of chemioal and vital inertia may last, perhaps, indefinitely. He then gives the following oases in illustration:-M. A. P. De Candolle mentions a case where grains of the Sensitive plant germinated very well aftor apwards of eixty years repose (Physiologie, p. 621)。Girardin has seen Harioot Beans germinating whioh were taken from the herbariam of Tournefort, where they had lain for a century. In 1850 Robert Brown sowed, for cariosity, some seeds from the collection of Sir Hans Slomne, 150 years old, several germinated, as for example, one of Nelambium speciosum, of which the plant is still preserved in the Nataral History Museam. He refers to the popular notion of "Mammy Wheat" having germinated, only to refute it, adding, that it appesars that the grains were sterilised before being pliceed in the tomb-but he doss not give the proof of this. The present writer finds the starch grains to be perfeotly sound, and to colour readily with iodine; so that the grains could not
at least have been boiled. The most extraordinary oase to which he refers was observed by Prof. De Heldreich (Garten Flora, 1873, p. 323), the Director of the Botanic Garden at Athens. In botanising aboat the mines of Laurium be discovered in 1873 a new species of Glanoium, G. Serpieri. It made its appearance from under a thiok layer of voleanic scoria, to which he would assign a date of 1500 years. He concludes with a reference to the investigations of M. Peter, who took soil from the interior of forests, and, after taking every precaution, found that soil from ancient forests gave rise to woodland species only; but soil from reoent forests supplied species of open plains and fields, acoording as the forest had replaced these respectively. Admitting that his experiments did not decide the question, M. Peter thinks it would be safe to allow at least fifty years of duration of arrest of vital activity in the seeds baried in the soil of forests.

\section*{New or Noteworthy Plants.}

\section*{CIRRHOPETALUM ROTHSCHILDIANUM, \(n s p\).}

AT the meeting of the Orchid Committee of the Royal Horticultaral Society on October 15, the Hon. Walter Rothachild exhibited what was unanimously agreed to be the handsomest of the plume-bearing mection of Cirrhopetalum, and under the above name it was awarded a First-class Cortificate-an honour only once before accorded to a member of this singalar genus. The plant was received from an explorer somewhere in the hills beyond Darjeeling a few yeara ago, but owing to its long and slow journey it, together with a few othera, chiefly new botanical Orchide, arrived in so withered a condition that only this season, after caroful nursing, has it succeeded in flowering. As the cultivated pseado-bulbs are acarcely one-third the sizg of the imported onen, it is but reasoable to in'er that the flowers, beautifal though they are, will atill improve as the plant gains strength. The paendo-bulbs vary in form from ovate to Pear-shaped, each bearing a single fleahy light green leaf, more or less diatant on the rhizomes. Scape erect, 8 inchen in height, baaring at the top a one-sided umbel of flowerv, each over 6 inches in length, and exceeding 1 inch across the broadest part of the lower sepals. The prevailing colour of the flowert is bright crimson-parple, some blotches of clear yellow appearing on the sepals. The cacullate upper sepal is yellow with parple lines, and with marginal fringe and a very anaitive plame of a parple colour at the apex. The petale are narrower, bat similarly coloared and decorated. The lower sepale show little other colour than rich crimson-parple, the ame hae pervading their slender tail-like appendages, which tometimes intertwine, and at others are free. The triangular, grooved, hinged labellum is parple, and the whole flower so remarkably sttractive as to command attention even from those who profess to care for nothing bat the howiest Orchids. Its neareat affinity seems to be C. Collettii, Homal.

Caytheya labiata Broomeasa, n. var. This is one of the finest of that best aud most urefal section of C. labiata known as "autamnflowering." At a glance its gorgeons flowers remind one of C. Wartcewiczil (gigas), there being in this a similar broad expanaion in the front of ite velvety crimson-purple lip, which also bears on each side the roundish cream-coloured blotch urually seen in C. Warceewiczii. The broad petals expand to nearly 8 incher, and both they and the aepale are of a warm rosy-purple, the venation being diatinctly traced by a darker tint of the asme colour. It was lowered by Joseph Broome, Eiq., Sanny Hill, Llandudao (grower, Mr. Shill), who ir not only very fortunate in getting fine varieties of Cattleyas, but is also an adept at cultivating them up to their besto James O'Briex.

A N N U A L S
Not only in every gardening paper, but slao in conversation with any member of the ancient craft, do we frequently hear the pithy remark on some floral or frait exhibit: "Ab, they're what I call well done ; " or Mr. -- , gardener to His Grace the Dake of Blankshire, exhibited in mont clawes, ked it is needless to ay all hir exhibits were thoroughy "well done."
To confine my remarks to one very humble clau of plants, though one more often ill done than the opposite, "annuale," it will be found that there is rcarcely anything a gardener or amatear take in hand that will more liberally repay care and proper cultivation.
The average amateur, and, I may an well asy it u think it, nine out of ten professed gardenern, look upon annuals from such an obtuse angle that rurely do you see a genuine attempt to get the bett realla out of these most varied and in most cates elegant, not to say beantiful, denizens of our gardens.

For the hardy kinds-to neratch a need-drill or circle in the ail of the border or bed, or to now tho seed broadcast, and then rake in, conatitates the total that is aupposed to be necemary to get a good renalt, the young seedlinge come up, and then are left to take care of themselven. It may be, if the annual sown is what is termed half-hardy, that tho seed is nown in a box or pan, and placed to germinate in a hot-bed, or on a thelf in the greenhouse, bat even then eventaally the poor tender nurselinga are left till they being sown thicker than should be, become drawn, and get woody and hard, while the pan or box gets fall of roots; and when the time comes to transfer the reedling plants to the bede or bordert, they are aickly, apindly, and showing immature bude or blosnom--in fact, they are only fit to be put on the rubbish-heap, as they cannot now repay farther troable, and if planted out will only lead to disappointment. Poor thingo, they are " ill done."
Bat let us look on the opposite of this. I have in my mind's eye a young man, whose ambition and deaire it is to neglect nothing he has under his caro and who, like the deacon's wonderfal chaise, has no weak point, a maxim with him being, and it it a capital one-" Worth doing, worth doing well."
Beginning at the foundation, he treats hits soilto a generons coat of half-decayed dung, leaving thii on all the winter, and then digging it in. As soon whe the soil has "sagged," i.e., nettled down to ita unal level, selecting a d-y and still day, he jutt atirs the arface with the Datch-hoe, and then drawing a drill, of a depth adapted to the size of the seed to be somp, he commits the wonderfal germs to the carre of mother earth, rakea in the noil carefally, and than gently treade the earth firm around and above the seed. If the weather be warm and showery, the minate cotyledons (seed leaves) will soon appan above the surface, and continuing growth will be rapidly followed by the true leaves, Now the firt thinning is made ; and after this is done, should the weather be dry, a slight watering with a fiee-rote pot will again settle the disturbed noil, and give the young nurselinges a further impetas to grow. Room to develop themselves fally is thav secared, and the greater distance in reason the planta remain sparth the better the final result. The laet thinning mis bo made when the first budu appear, when, if thees directions are followed, the seedlinge will be atardy, evenly balanced and grown, and able to take care of themeelves, rarely needing any aticks or ties.
The grower will now be rewarded by plante amply clothed with healthy, well-developed foliage, mationg them even at this atage protty objecte, for the majority of hardy annuals have elegant foliaged When, however, they flo wer abandantly, with encl flower well developed, the ample reward for all care will be reaped. Many whonever anw annanil once grown will be astonished, and all will at onfer concede that they are "well done." The dwarfer Clarkias, Godetias, crimson Giant Mignonette, Esehacholtziar, Schizanthus papilionaceat, she making single apecimens 18 inches high and the esme through; while exch coarreer-growing abjoets
ns the annual Cbrymanthemums, Malope, Lavatera, Bartonia, Cacalia, Calliopsie, Calendula plavialis, Campanula macrontyla, Centarrea deprena, Entoca,
flower, and Whitlavia will range from 1 to \(2 f\) feet. One can scarcely realise the rat difference in appearance they prenent when cared for, instead of

 ( BER P. 60\%)

Hibiscna, Emperor Larkapur, Love Lien Bleeding, Lupins (in variety), Martyniap, Nemenia, Nigella, Shirley Poppy, Prince's Feather, Miniature San-
being neglected; on the one hand being really henduome, ffective, and useful, but on the other little better than mere weeds. Thomas Bunyard.

THE WHEAT CROP OF 1895.
Up to October 20,1894, on which day the experimental Wheat was Bown, the autumn was favourable for agricultural operation. After that date much rain occurred in some parte and but little in others. The winter also was protracted and severe, and to a certain extent injured the Wheat plant.
The following Table nhown, in the unual form, the produce of Wheat on the melected plota in the experimental beld at Rothamsted for 1895, which is the afty mocond year of the successive growth of the crop on the eame lind. It aleo given for comparison, the average produce of the same plote over 10, 33, and 43 yearn, 1852-0 1 incluaive.

(1) Equal to 81 bunhels at 601 lb . per buashel.
( \({ }^{2}\) ) Equal to \(29 \frac{2}{3}\) bushels at 601 lb . per bushel.
(2) Equal to 208 bushele at 00 lb . por buehel.
(i) Equal to sil bushele at 00 Ib . por buahel.

The seed having been sown in October, the Rothamsted experfmental crops suffered comparatively little from loes of plant during the very eevere weather in January and February. Following the much more than average produce of 18 bushels grown on the unmazured plot in 1894, the Table shows that in the present year the yield was only 10 bushels, which is considerably below the average yield of the plot. On the other hand, the land manured every year with farmyard dung gives, this year a produce of 434 bushele, of more than 68 lb . per bushel, which, if reckoned at 60 lb ., is about 11 bushels more than the average of that plot; and the crop was gencrally selected by those who visited the field as much better than that by any of the other manures. The selected artificially-mamured plots give in fact an average produce considerably be'ow that of the dung; partly owing to injury in the spring to the piant on piot 16 , which receives besides mineral manures a large quantity of nitrate of soda; and as happens in some seasons with such large applications of nitrate, the surface soll became very moist, and when it was rolled in the apring it clotted, and the reault was injury to the plant, and defective growth, whilst the leaves had a very dark green colour.
The chief features of the experimental crope this year are high quality of grain, and a very small quantity of atraw, and much the same may be said of the crops of the country generally. Whatever may be the actual weight of the bushel grown, farmers are in most districts required to deliver 69 lb ., and fortunately this year a measured bushel will very frequently weigh 63 lb ., and British grain will be in request by millers. The shortness of straw is, however. a great misfortune, especially since the value of the straw for thatching and other purposes, is stated to be a chiof reason why many bushel of the grain on our selected plota was close npon 631 b , the average produce of 293 bushels corraponds to 81 buehele at the official weight of 60 Ib. In compering the estimato 31 buthele so arived at with thers five irrespectivels of
 weight por bushel, which than yoar would in mayy caters be as much as 63 lb ., and in othern perhaps reckoned at that weight, it ahould be borne in mind that such entimates would this jear irequently represent about 13 bushel more if reckoned at 00 lb . per bushel.
Adopting, for the sake of argument, the average produce o our selected plots an indicating the average produce of the United Kingdom, the question arises what will be the yield of the country, and what will be our requirement from other sources? A careful study of the climatic conditions of the harvent.year would point to the conclunion that they were at any rate not unfavourable for a full average crop of gratin where the moil conditions were favourable. Indeed, the Table shows that without manure the produce was much
below the average, with farmyard manure much above average, with the highest artificial manure also above average, but with the others below average. It would seem that the result was much the same in the country at large; that is where the condition and the cultivation of tine land were good, more than average crops have been obtained, and where they were bad there have been less than average crops. The very small area of Wheat grown this year is doubtless partly due to the wetness of the autumn; and if we knew how much was got in badly, or sown ton late, we might be able to make more confident estimate of the yield of the country. At any rate there is reason to fear that it will prove to be below the yield we have recorded.
Although there is at present more labour and time spent than formerly to ascertain the produce of our Wheat crop, the question as to who is to benefit from the information when it is ohtained, must now frequently suggest itself to commenced until comparatively recently, the yield of the hom Wheat crop was an important factor affocting the supplies which we received from other countries; and the rise and fall in our own produce was watched with great interest by both bome and foreign growers as well as by dealers. After the bad Wheat crop of 1860 , the imports of wheat increased from 43 million quarters in the previous harvest year to \(10 \frac{1}{2}\) million in 1860-61; while after our great Wheat crop of 1863 and 1861, the imports fell from nearly 91 millions in 1862-3, to a little over 7 millions in 1863-4, and to about \(5 \frac{3}{2}\) millions in 1864-5. It will he of interest to show on the other hand how little the yield of our home-grown wheat influences the foreign supplies at the present time. wheat influences the foreign supplies at the present time.
The Board of Agriculture estimate of the yield of the Wheat The Board of Agriculture estimate of the yield of the Wheat
crop of 1891 in the United Kincdom was \(30 \%\) bushels of indecrop of 1891 in the United Kincdom was 307 bushels of inde-
finite weight, which would probably represent about 32 finite weight, which would probably represent about 32
bushels at 60 lb . per bushel, our own estimate being 33 bushel at 60 lb . per bushel. As the imports with which we have to compare the home produce are reckoned at 60 lb , it will be more convenient to adopt by way of illustration our own estimate, which was obviously not much higher than that of the Board of Agriculture would be at the same weight per bushel. Now, deducting 2 bushels per acre for seed per bushel. Now, deducting 2 bushels per acre for seed reckoned on the area of the 1894 crop, we last year estimated
that re million quarters would be available for consumption from the home crop, and that rather more than \(21 \frac{1}{2}\) millions would be required from stocks and imports, to meet the requirement for consumption at 6 bushels per head, and that the total requirement so estimated would amount to 297 million quarters. But the actual imports within the harpest yoar 1894-5 were nearly 243 million instead of only \(21 \frac{1}{2}\) million quarters, as estimated to be required. According to these quarters, the total available supply from home and foreign figures, the total available supply from home and foreign
sources would amount to about 32 million quarters, leaving A surplus of more than 3 million quarters to be otherwise Parplus of more than 3 milion quarters to be otherwise ever, that the area under the crop in 1895 was more than 500,000 acres less than in 1804, upon which the above calcu-
lations are founded. Adopting the number of acres now lations are founded. Adopting the number of acres now
recorded as under the crop in 1895 (though it is said that some which was sown was afterwards ploughed said that amount required for seed was less than was lod upl the mated, leaving of course more available for consumption ; and if we assume the previous calculation to be so corrected, the if we assume the previous calculation to be so corrected, the
result would be that the total available supply from home and result would be that the total available supply from home and
foreign sources would amount for the last harve jear to 32 , foreign sources would amount for the last harvent jear to \(32 \frac{1}{2}\),
instead of \(32 \frac{1}{3}\) million quarters, and the surplus would be instead of \(32 \frac{1}{3}\) million quarters, an
rither more than 3 million quarters.
It may be stated that our imports of Wheat last year reached on mount equal to feeding five-sixths of our population. With favourable seed times, our own area under the crop may indeed increase more or less beyond that of the past year; but unless growers over some large areas of the world find that it does not pay them to deliver Wheat into our ports at the prices current at the time, our own growth of the crop cannot be xpected to show much life, or to be the importon cannot be British agriculture which it was before the severe competition foreign producers in recent years. J. P. Lawes, Rothamsted October 31, 1895.

\section*{BERLIN}

\section*{GERMAN \(v\). BRITISH CYCLAMENS.}

Ar a recent meeting in Berlin there were exhibited Cyclamen pernicum grown from Englifh seeds. Besiden these, some German sorts of the same plant were exhibited. The Eaglish worte were the following:C. persicum hybr. and C. p. h. parple, from Mearr. H. Cannell \& Son of Swanley; C. p. Crimson Queen, Duke of Connaught, giganteum roseum compactum, and Rons Morn, from Mesurs. Carter \& Co., London; C. p. Brilliant, Criman King, and Mauve Queen, from Mr. George Reid of London. The German \({ }^{\text {morte }}\) were:-Käthchen Stoldl, pure white ; White, with carmine eye; Rosa, from MarienChal, stold at bright dark-parple form from Mr. C. Stoldl at Hamburgh. The plants were grown by a Cyclamen apecialist, M. Sehwarzburg, at Pankow, near Berlin, who grows every rear at least 4000
to 5000 planta. The object of the exhibition
to ascertain whether the Englich sorts are so much better than the German ones, that it would be desirable to introduce English Cyclamen blood into German cultares. A year ago similar trials were made with English Primula chinensis, which gave the result that the English sorts were in some way much better than the German ones. This I mention to show that the German gardeners do not hesitate to acknowledge the beat even when it come from abroad, and that they by no means aesert that all German things are best. On this occation not one of the English Cyclamens could rival the German varieties; indeed, the flowers were so little satisfactory compared with those of the German sorts that they would rank after all otherv. Bat not only were the flowers compared, but also the leaves, I do not know whether in England worts with self-coloured leaves are preferred [ No ]. Here, in Germany, leaves are desired which have a rich marbling; the more they resemble thone of C. hederefoliam the higher they are valued. The English sorts were robust and very healthy plante, bat the foliage was green, and therefore also, like the flowers, of less value. As Mr. Schwarzburg remarked, the reason for the superiority of the German sorts is that German Cyclamen growers do not buy their seedy, but raise them themselves. They select from their whole stock of many thoassind planta only some twelve to twenty plantz, for need-growing. By regular selection during many years, they have raised sorts which are accounted excellent for their pure colours (the Eaglish sorts by no means showed this quality), for their very large size (the German orta are moatly about one-third to one-half larger than the English ones) [!], for the good bearing of the flowert, and for the good colouring of the leaven, which are also of good habit. Mr. Schwarzbarg asid it may be ponible that English growers have a different method of cultivation to that of the German gardeners, and that he would much like to learn the Engliah plan, so as to make a further trial. During the debate a seed merchant, who is also a apecialist in Cyclamen cultare, Mr. Van der Smissen, of Steglitz, near Berlin, remarked that there are in Germany four centres of Cyclamen culture-Berlin, Hamburgh, Frankfort-on-Maine, and Dresden. The latter place prodaces sorte which differ notably from those of the three other placen. He remarked also that the German weeds cost about one-third less than the English sorts. Whilat among the above-named Engliah sorts are nome, of which a thousand seeds cost £3 15s, the beat German sorts cost £1 per 1000 seeds. To these general remark, your correspondent would add a hope that Eaglish Cyclamen growers will visit the great international exhibition in the apring of 1897 at Berlin, where they may nhow what first-class English-grown Cyclamens are. Perhaps some English Cyclamen growers will be kind enough to send some good flowering apecimen now, that they may be compared with oura. Should it interest any of the English growera to learn how Cyclamens are cultivated here, I shall be glad to give information. Plante with 100 and more flowern are by no meann rare. Only by interchange of knowledge is progrens ponsible. It is not for one or another to hold a monopoly, but it is for all gardeners to make une of the experiences of the auccessful ones. That is why it in so much wished that English gardeners should come to the large exhibition with their products. We shall learn from them, and we also can promise that Euglish gardeners may here learn a few things from at,
The antumn here is this year quite an abnormal one. Carionsly enough, though the average day temperatare for some weeks hae already been above the normal one, a great many trees and nhrub are atill green, a fact quite unprecedented here at the beginning of November. In many places Dahlia variabilis is atill flowering in the open air, whilst in other year, these plant are killed by frost four weeks earlier. The reamon is, that we have not yet had a mevere froat, and that the plants are gradually accustomed
to a lower temperature. It would be intereating to
try if plants grown from seed which ripens now, would be more resiatent to our climate than the mother planta. A plant that very seldom froita here is Sophora japonica, which this year beara much fruit; whether these will ripen is another question. Paulownia imperialis has flowered here this year, also a very rare occurrence. I do not know whether it has ever done so before.
Chrysanthemum nipponicum is a plant that nome time ago was sent over to us an a very fina novelty. It is in flower here now, bat it is worth nothing. The plant itself, with its thick fleshy leaves, is interesting, but the flowers are not good.
Saintpanaia ionantha, or, as it in called here, the Violet of Usambaria, is, on the contrary, a mot delightful and very satisfactory plant. Seedligga raised in January were in fall flower in June, and are atill flowering now, Nov. 1 , in my room, Cer. tainly this Gemneraceous plant is one of the betn novelties brought forward of late years. Besides meding freely, it is easily to be propagated, like a Gloxinii, by leaven. The culture is quite easy. It is to be hoped that East Africa, eapecially Kilimandzaro and Usambara, will furnish us with ome other worthful plants for our gardens. Prof. Volkens, who he lived for one and a half year on Kilimandzaro at an elevation of 1550 mètres, at Marangu, showed at the last meeting of the Berlin Horticaltaral Societs, a good many mont interesting plants, which grow at an elevation of 4000 mètres and higher, and which would be quite hardy here also. The mout interesting ona was a new species of Rubus of the Blackberry groap, with fraits 2 inches in diameter, and of a yellow colour. Alao a nem Anemone is very remarkable. Very large is the number of Monocotyledonous planta from Kilimandzaro which are worth growing by ud, Amongat the Polygonacex, the moat remarlable is Rumex nervona var. unambarensis, a climber with atems 8 inches in diamater, with enormous pure purple frait-talks. It grows at an elevation of 2800 mètres. The Killmandzaro plants are of the highest value, eapecially for Eaglish gardeners. Professor Volkens remarked that for eight monthe the oun is not to be seen, because clonds, and fogn, and rains darken the aky. The rains are not thunderstorms, an in other tropieal regions during the rainy neasons, but mild raios The total rainfall observed daring one year, at an elevation of 1550 mètres, was 1900 mm . The highest temperatare is not equal to that which wo have in the aummer months. Potatos grew very well, also all our other vegetables. Vines do not ripen; it is possible that the damp is the canes of thic. Barley grows very well ; but when the main stalk begine to how its ear, the plant ramifee, and young shoots grow up, no that afterwards all atages, from young shoots to ripe ears, are on the mme plant, which gives much trouble in harvesting. Professor Volkens thinke that this may be altered by selection of the plants and by raining local sotha U. D., November.

\section*{FRUIT GROWING FOR SMALL \\ GARDENS.*}

First, having settled upon the size of the plot of ground we can apare for growing Apples and Pum, the next point to decide is what shape our treel shall take, as the number of trees to be planted in a given plot will depend upon their shape; then, having finally settled upon the number of trees we are ablo to plant, the next most important atep to decido is the kind to grow, and in what proportion. Thisw shall find a most difficult task, for, although we may know of several good kind ourselven, it will not help us much, as most of these are grown entirely for the markets in large orchardn, and are wholly anauitable for growing in small gardent, owing to the large size the trees attain, besides which many of these orchards have been planted for the last gene ration or so, and other kinds of better flayonr, and better keeping qualitien have superaeded them. A an instance, we probably all of us know what a good

Fxtracts from a Paper read before the Strestham Agaseíz Society, on Oct. 25,1895 , by Mr, J. C. Walthat=,

Apple a Blenheim Orange is, and I have known eeveral, for this reason, who have grown it without making any enquiries about it, and have been terribly dianppointed, for the Cox' Orange Pippin has entirely taken its place; first, becane it comes into bearing when only three to four years old, whereas the former cannot be got to bear until it is folly twelve years old; and, secondly, it bears more regularly, and keepa a month longer and better than the Blenheim Orange does, and without doubt is a far aperior Apple all round. Again, if we look through catalogue, we find some 150 to 200 apparently more or less good varietien, so that we do not get much information from thin source. By far the best plan, when it cas be adopted, is to go to a good grower, and get him to give you a ammple or two of each of the bent kind ripening each month, and most uitable to the growth of trees you propose to plant; by this means one is able to jadge for onenelf of the quality of the fruit, and suit one's own individual tate.

\section*{Tratinge,}

There are some five or six methoda in general ute for training the trees. Firat, we have the orchard atandard, which, owing to its size, is quite nasuitable for mall gardens, as they not only take away too mach natriment from the ground, but prevent light and air from getting to the plants, \&ce., in ite vicinity. As it does not come into bearing uatil some five or six yeara old, the amateur atandard is not infrequently grown. It is similar to the sbove, bat the straight atem is covered with short spars, which are allowed to prodace frait antil the apper portion of the tree is in full bearing, when they are cat off, thus giving us a bearing tree some two or three years earlier.
Where apace in a amall garden is very limited, the walk is often bordered by espaliera; these are trees grown on a atraight atem, with branches about 9 inches apart running at right angles to it in the amme plane, and are trained and kept into position by being fastened to wires atretched from post to post. They nually bear well, and if heavily laden, there is no chance of the branches being broken, nor is the fruit so eavily blown off in a high wind; but the greatent objection to this method of growing trees is that it wereens the garden far too much from light and air, and plants will not thrive unless there is plenty of air passing through a garden ; in fact, they act, in this respect, as a second wall to the garden, as the branches are to close together. Many Apples and Pears will do very well on this principle when grown against a south or west wall, but are very liable, when the stalks are long, to get damaged by rubbing against it; beside which, the un can ooly get at one side of the fruit, and the branches are reduced in bearing surface by exactly a half, as those bude next the wall cannot, of course, come to matarity. Such treeashould be planted about 15 feet spart, and ahould never bo tied permanently to either wall or wire until they have been in the ground for nome four to siz weeks, and have had time to thoroughly settle, as otherwise many of the amaller branchea will probably become damaged through the strain put apon them by the tree sinking. Trees are also grown againet wires or walls in the shape of fang, but there in more troable in training these than eapsliere, and they do not cover a given aurface to well and evenly as the former do. For Goomberries, Cherries, Peaches, \&c, this method is, however, more aitable, as the growth of thene kinds of frait trees is not mo robust as with Pears and Apples.

Borders are sometimes edged with trees in the form of a letter T , the two side branches forming the top of the T are fastened to a wire about 9 incbes to 1 foot from the ground. But these are not much good, as they have to be transplanted so often to prevent them cankering; they are aleo very liable to be choked by surrounding plants, and the fruit and wood do not become properly ripe. They should be planted about 12 feet apart.
Hedges are made of cordon trees about 2 feet apart, which are also uned for covering walls. These are trees with straight atema apon which no branches
are allowed to develop; so soon an the would-be branch is about 6 inches long it if cat, and not allowed to grow any longer, tha the atem in time becomes thickly atadded with apars, as they are usually called, upon which the frait is borne. They have to be continually traneplanted, anless they are allowed to grow to a great height, otherwise they grow too fast and will canker through being praned so much to keep them within bound. It is a growth of tree which is not to be recommended except under special circumatances, auch as a high narrow wall where no other kind of trees would be suitable, or where everal kind of fruit are being tried for experimental parposes and little room can be given to them. They are uaually growa in an oblique form, no that the fruit hange away from the atem as much as porsible; they mometimes take the form of the letter U.
We now come to the buch tree, which requires but very little attention, fraits well, bet is very lisble to apread about too much for a mall garden, but there are a few kind of fruit that will grow in no other way; when such kinds are required, there is no other alternative than to grow them in this form. (That now before you is a Jargonelle Pear about ffifteen or sixteen years old, bears regularly every year, and has only been transplanted once during that time.) If thay are planted cloner than 4 to 5 feet apart, they would require to be taken up every three or four years.
The best of all trees, and undoubtedly that most muitable for amall gardens, is the pyramid. This tree has a straight atem through the centre, with the branches radiating out from it on all sides, and when once fairly started, will keep growing in this shape with but very little troable and attention other than pruning regularly twice a year. These trees, if not allowed to grow too thickly, produce the fineatflavoured fruit that can be got, and, if proper sort: are grown, will fruit regularly every year. The plan I myaelf adopt is to plant them 5 leet apart all wayp, and not allow any branches to grow lower than 12 to 15 inches from the ground; dwarl Beans, Peas, Spinach, Lattace, \&ce., are then grown in row: between them.
Having decided upon the shape of the tree we wish to grow, the next point to wettle iz whather we will graft our own, buy young trees, or thowe which are already et with fruit-buds.

\section*{Grafting.}

Grafting is very intereating work, bat not to be recommended except for experimental parposen, an one-year-old treey, or "maiden," as they are termed, cost only 10 d . to 18. 6 \(\%\) each, and will commence to fruit in two or three yeare; fruiting trees cont from 3s. each upwards, and will bear the next year if kept well watered daring the dry season, thereby saving both time and labour. It may not, however, be out of place here to describe the method of grafting. Young well-rooted trees about the sizg of one's little finger, usually known as atock, are procured from any grower, and when well-established, are cut down in an oblique form to withinaninch or mo of the ground, the catting or scion is taken from the tree just as the sap it rising, and also cat in an oblique form, the two fresbly-cat parts are then bound tightly together, care beiog taken to see that the bark of one is touching the bark of the other, so that the sap which rises between the hard wood and the bark can make an easy paseage through from one to the other; it will not matter if the barke on the opposite side do not touch, bat the nearer thay are the better. Clay, well-kneaded with horsshair, is then packed closely round the joint in the shape of age to keep the sir out. If this is covered over with a Rhabarb leaf it will allow it to dry more gradually, and probably prevent it from cracking; all cracks must be filled ap at anon as they appear. Various atocks are ueed according to the tree which is to be grafted on to them. Apple is grafted on to Qaince, Pear on to Paradise, and Cherry on to Mahaleb, Plum on Massel. Old, wornout trees can profitebly be made nas of by catting back half the branches to within 6 inches of the
ntem; on to these are grafted nome two or three acions. The year following the other balf ahould be cut back and grafted in the anmo way; they not onfrequently commence to bear the next year.

\section*{Planting.}

As the fature of the tree depends largely upon the way it is planted, too much eare cannot be expended upon this. The holes to receive the new trees ahould be dug nome time before they arrive, so that the earth can be got into condition by allowing it to absorb an much oxygen ae possible; and it ahould be only jast as deep as will allow the tree to be buried to the same depth a formerly, but muat be large enough for all the roots to be laid out atraight on all sides. Care ahould also be taken that the roote do not become dry or touched by the front during removal; and before they are planted all damaged roote should be trimmed with a aharp koife, otherwise they will become diveared and will injure the tree. Before planting, tie the apper fibrous roots around the trank, then place the tree firmly in the centre of the hole, apresd out the lower roote evanly all round, and if large and atif, stake them in position should this be necesary; work in loose earth around and between them, fill in to the apper lot of roots and tread down lightly, The upper roots should now be nutied, laid out all round, and covered with loone lonm, to which a little lime has been added, and the whole trodden firmly down. When a second person's eneistance can be procared to keep the tree straight, it will makn the work all the eatier. If the trees are received from the naraery directly the leaves have fallen, and at once planted, they will get thoroughly settled in by the autumn rains before the froat comas, and will commence growing at soon es the other treen do in the apring, and will than experience hardly any check at all, which they would do if plented in the apring.

As the woolly aphis or American blight is about the only enemy which attack Apple trees, I might just say here that the best way to get rid of it is to bruah the part affected with a hard paint brush dippod in a weak wolution of paraffa and water.

\section*{Proniva.}

Trees, like children, to be properly trained, muat be taken in hand when young, and although we can follow a general routine in caltivating them, yet the details of their cultivation must depend, in each case, apon the individual variety. For inatance, some varietier grow very erect, and if allowed to continue in this form will choke themelves, prodace very little frait, if any, and this of a very inferior quality. Bat as our objoct is to get open trees so that light and air can get at every part of them, it woald be no are in this care praning to a bad on the inside of the branch, as the latt bad always forme the leader for the next year, and would therefore grow directiy into the centre, and the tree would be atill more crowded ; we must therefore prane to bade on the underside and the branches will then grow outwarde and away from the centre. Again, some kinds have a propensity to droop their branches, so that if the last buds left are under onef, as in the former case, they will very soon grow down to the groand ; in this inatance s top bad must be left tn erntinue the branch. Whan the brach is sofficiently long to allow of ite being duplicated at the and without fear of crowding, it should be praned to a point where the laet bad is on one side, and the next one is ezactly on the opposite side; these two bufa can then be allowed to grow, and will form a \(V\) at the end of the origiaal bravch; but when the two end of the \(V\) are about 1 foot apart, the direction shousd then be again altered into a parallel direction by praning to an inside bud on ench arm. The aim alway to be kept in view being, never to allow the centre or any part of the tree to become crowded. As ageneral rale, the lat three bads on a branch will shoot ont and form new growthe, while the remainder, if the tree is halthy and not too vigorous, will develop into fruit bude, oo that with thil knowledge in view we can alwaya prane our trees to form branches in whatever direction we like. It is a
moot point an to when trees should be pruned; some say during summer and autumn, whereas other do not agree with this, affirming that the tree is harmed thereby, and that all praning should be left till the atumn; again, those who advocate apring praning give it as their opinion that the newly-cut parts are liable to be injured by the front coming before they have time to heal over when carried out in the antamn.
There is no doubs that there is some foundation for all these assertions, but, on the other hand, if the pruner bas a little common-sense and jadgment, they can all be overcome. Natarally, if the tree is pruned all over at the end of Jane, it is, as it were, auddenly thrown out of gear, as there are no free channels for the ap to flow through, and no doubt a great deal of injury will be the result, bat the method I myself have paraued, and with the best resalts, is to prane only the side-shoota back to two eyen, and not touch the end shoots at all. The anp, then, is checked but very little, and the surplus which is not required for continuing the branch onward flows into the fruit, which is then large enough to take almost any quantity, and the two bads in most cases will lie dormant, and form frait-blonoms for next year; if, however, there in not anficient frait on the tree to abrorb this surplus aap, only the upper of the two buds will shoot, and mast be cat back in the antumn to two bade again, while the remaining bad will be are to develop into a fruit-bud. Here, then, is a distinct gain of one year, for if the shoot had to be left till the autumn to be pruned to the two eyen, it would then have been far too late for them to develop into frait-buda by the following spring; the remainder of the tree is then praned in the autumn directly the ap han ceased to flow, and the newlycat parts will dry before the frost comer on, when no harm will result. When the tres is in the condition it ahould be in, hardly any pruning will be necemary, other than cutting back the new wood at the ends of the branchen to 6 inches from the atart. There is still another advantage in anmmer pruning that should not be overlooked, and that is, that light and air will more freely circalate in and about the tree, and its bearing propartiea be considerably increased through the wood being ripened, that is becoming hard through the zap being, to a certain extent, dried up, and the fruit is better matured.

\section*{Selrction of Varibtirs.}

At already pointed out, a difficulty that always arises is the choice of varietien most suitable to amall-growing trees, and therefore a little gaidance as to the best hinds to grow will not be out of place. Tastes vary very considerably; but for my own part, I prefer Applen which are crisp, jaicy, and weet, and with the later kinds, good keepers, and not liable to get woolly (early kinds should invariably be eaten direct off the treen, as they soon lone their frethness); in the cate of Peara, they should be luncions, jaicy, and remain ripe for some time before going rotten or sleepy.
The following varieties of desert Apples falfil the above conditions an nearly at ponsible, are reliable and constant croppery, and will give continual supply for ten or eleven montha, viz.:-August, Devonahire Quarreaden (which, however, will not thrive in cold, damp localities) (Irish Peach)*; September, Worceater Pearmain (Lady Sadeley); Oztober, Mother ; November to Jancary, Cox's Orange Pippin (King of Píppins); Febraary to June, Starmer Pippin; April to May, Allen's Everlasting. Should only one be required, Cox's Orange Pippin should bo grown ia proference to all other, as it keeps no long (November to Janaary), beara well, and is of mediam aize. I have had over thirty good-sized fraits on one of these trees when only four years old. Althongh the above list is very condenaed, I consider it far better to plant saveral trees of a small number of varieties, provided they are good kinds and constant bearere, than fow trees of several varieties. Highly-coloared Applen, grown prin-

\footnotetext{
hinds.
}
cipally for how, are asually soft and woolly; some, however, prefer them.
Cooking Apples are uaually no cheap, that they are hardly worth growing, unless one has plenty of room ; but the following varietien are good bearers, and worth growing where practicable:-Augast to September, Dachens of Oldenbarg; September to Ostober, Lord Grosvenor ; Oetober to Janaary, Bismarck; (November to Dacember, New Hawthornder), (November to March, Wellington); November to April, Lane's Prince Albert. A! Apples are dearer in the apring of the year than daring nummer, Lane's Prince Albert should be grown in preference to the othera, where all cannot be grown, as they give a anpply from November to April (aix montha).*

\section*{(To be continued.)}

\section*{FORESTRY}

\section*{THE EDUCATION OF THE FORESTER.}

Mr. Forbes' letter on this abject in your last number raines a queation which has often baen discussed in your columns before, bat seldom with any practical realt. It is perfectly true that, with the exception of a few great estate in Scotland, a few Royal and Government forest in Eagland, and here and there a property whose owner is in the happy position of being entirely independent of the income derired from it, there is no such thing now. a.day as scientific forestry in Eagland, no demand for scientific forestert, and, as far as I can see, no reason why there whould be. The reason it a very aimple one. Scientific foreatry doen not pay. Royal Commiarions may be appointed, and achools of foreatry institated, lectures and articles on the subjoct without end may be written, but all will bs perfectly ueelens, because the people who have to manage propertie know that the whole thing is purely peculative, and in my humble opinion there is far less opening for cientific wood management or forestry than there was a century or two centuries ago, when, if there were not many cientific foresters, there were plenty of excellent woodmen who knew their businent and did it. In those daya there was some certainty of a fair return for their labour and oatlag. Now there is none. If any one can thow a profis-and-losiaccount of the woods and plantations on any property in Eagland which daring the last ten or twenty years have been so managed as to pay a fair rate of intereat on their original cost, it would do more to encourage cientific foreatry than all the talking, lecturing and writing in the world; but eithar such a thing does notexist, or the conditions are so exceptionally favourable that they are no guide to ordinary practice. Is there any nort of timber or wood product which cannot be producad in some other country far cheaper and in many cases better than in Eagland? If mo, I have not discovered it, and I have aeen more of the foreste of North America, Europe, and India, than nine out of ten of those who talk about meientific foreatry.

There wat one tree which for a long time did seem as if it would prove a mource of profit to many English planters. I mean, of course, the \(\mathrm{L}_{\text {arch }}\); but what is the preaent condition of half the Larch plantation in Eagland under twenty jears old? and what have the ucientific forester done, or what can they do to stop the progress of a disease which neeme to be apreading and increasing everywhere? As far as my experience goen, abolutely nothing.
Mr. Forbes wayn very truly that the majority of British woodlande owe their exintence to the game they harbour, and I believe it is a literal fact that the mont scrubby, ill-managed, neglected woodlands, if well situated for game preserving, are worth far more to-day to asll or to let, and giva more satiafaction to their owner than the most cientifically. managed foreste where there is no game.

\footnotetext{
The paper was illustrated with practical demonstration of the various methods of gralting, samples of well and badly grown branches, be side: a good collection of the above-named
}

Another reason for the neglect of forentry in England is the absence of any certain market for the prodace. It is true that the owner of a large quantity of clean, sound timber not too far from a good road, and a manufacturing or mining diatrict, mas get a price of aome nort for it ; but what can the average Engliuh landowner get for the few reoru or hundreds of trees that he has to cat from time to time? What can he get for his bark or his nader. wood compared to what he got in bygone times?
At a rule, he only cat heavily when be mate money badly, and in ordinary timen cata only what he wants for estate parposes, firewood, fencivg, and so on. He could very often buy it better and cheaper, bat he doen not like to turn his woodnon of, and at any rate the money atays on the proparty. Bat he hates the very name of a timber merchant, who in mont diffizalt to deal with in such tranactions as an average landowner han to do with. If he cac get enough out of his wood to pay expenuen, and the young trees which he plants are not tatally crippled or deatroyed by rabbita, drought, apring frosts or insect pests, he thinks himelf lucky, add though he may plant for ornament or shelter, ho now hardly ever planta for profit.

I have often thought that a time mat come when the price of Eaglish timber will rise considerablyand no doabt this time will come; bat whether the accesmor of the men who planted it will get ay adequate return for ite original cost is as mach a matter of apeculation as the price of coal a handred years hence. The finance bill of last year had done more to check cientific foretery, or any other 80. called improvements of the kind which Eogliah landowners have hitherto done so much of, than the apportere of the bill have any idea of. When they have atarved out the land-owner they will want the State to do what he used to do, bat the goose will be killed by that time, and it will be too late to cr out. H. J. Elwes, Colesborne, Cheltenham.

\section*{WEST INDIAN PLANTS:}

Cxrtopodium Woodfordi, Benth. (Cybtopra Woodfordi, Lindl ). -In one or two districts of Gre nada this O chid is fairly common. Along the roadrite on stiff loamy soils it grows naturally, and also near st hand oftentimes it greenish-parple scaper may bo observed quite at home in swampy flat patches of land, peering out of the Sadger and other ammpo loving plants. It leaves simulate in situ somenhat those of a common Grenada grase, namely, Panicas palmifoliam. I am told by an old whita ettlerone C. W. Protin by name-that the lower portion of the plant yields a viscid sap, by whone nid broken wares may be repaired. Grisebach records (at p. 630) in his Flora of the British West andies, apon the authority of Crueger, that in colour tho flowers are "white, with a yellow apot on the lip." This reference meem; to me to raise a doubt a to whether Crueger did not mean Cyrtopodiam erit tatum of Grisebach instead, for-if my memory nerru me correctly-this latter terreatrial in a pare whiw with a yellowish tint nomowhere about the flowit When I saw it growing in the Arip: manas of Trinidad (B. W, I.), about three years sinct, brought to mind the Lily of the Valley. Oar Grenadan C. Wood fordi certainly showe no tendenct to white; but, on the other hand; is decidedly of brownish green-parple coloar. When collectiof herbarium material last year, I noticed the floweritg atem to be succulent and pliable, and the leares brittle. It flowers during the months of Augat and September, and posaibly October. W. E. Broadmas, Botanic Gardes, Grenada, B. W. I.
Poltpoditm (Edfolipodium) xiphoptanoidmontis Jenm. n. sp.
Stipites tafted, wiry, fliform, atiffly erect, browh aaked, slightly acariose, margined to the bave, 3 dart or inches long; fronde bipinnatifld, firm, erech, widp, green, naked, 4 to 6 inchen long, \(1 \frac{1}{8}\) to 2 inches widn ruddenly reduced at the base to minute deltoid aptrid like segmente, the apex termionting in a pinnasiad pinaa I to 1 I inchee long, broadent at the bave, otherwise similar to the lateral ones; pinnes aprein nide, linear, \(\frac{3}{4}\) to \(1 \frac{1}{4}\) inch long, \(1 \frac{1}{8}\) to 2 lires wid
broadly adnate and narrowly decarrent, forming a alightly interrupted wing to the brown wiry alightly fexuose rachis, terminating in a minute obtuse lobe, cat two-third to the dark filiform mid-vein into obtase obliquely deltoid decarrent segments重 to \(\frac{3}{3}\) line wide and deep, with an open, cblique, subacute sinus between; veins imple or forked,
the latter abraptly paas. Though the frond are larger, the pinna are only half the namber of thoue of melanosricham. The cutting of the pinda is exactly like that of Xiphopteris frouds. Pachille cefoliam, Kaulf, of Ecaador and Brazil, is the onty other pecip of this small groap. G. S. Jenman, Demerara, Oct. 24, 1895.

\section*{CORDYLINE BANKSII, ON STEWART ISLAND.}

This fiae "Palm-lily" ie one of the moat beautiful and interesting plant in the New Zealand florp. Although occationally cultivated in the touthern portions of the British Islep, it is not well known as it ought to be, from the besuty of its inflorescence, and the picturetque effect of it long drooping lesven. The drawing presented herowith. fo. 103 , is from a photograph taken by Dro J. R. Riley, of

Winton, and repretent a apecimen of the Banka Pdm-lily planted an a reedling on the Island of L"iva, Paterton' Inlet, Stewart Iuland, by the late Mr. Charles Traill in 1888, and flowering for the firts time in 1894. It present height from the base of the atem to the aper of the panicle is about 11 feet; the leaver are between 5 and 6 feet long, and about 3 inche broad in the middle, being narrowed into a rounded leaf-atalk, which becomer alightly expanded at the baec; a longitedinal red band aun down the middle of most of the leaves, and increases the beauty of the plant. The hage open pacicle, which in old plants is drcoping, and often from 7 to 8 feet in length, is characterised by the long, alendes, and rather distant branches unually forming a right angle with the rachis, and in at once aingular and beantiful, reambling a large apecimen of ramifying white coral. The common Palm-Lily, C. autralie, differing in its abort atiff leaves, and maller more compact panicles ; although acarcely less besatifal than C. Benkuii, is certainly less graceful, and presente a atrong contrat with that species, while it abtainas much larger size, apecimen 60 feet high, with a trank 6 feet in diameter, being occasionally observed; C. Bankaii sarely exceed 10 feet in height. C. australis in dietribated throughout the Culony from the North Cape to Stewart Island, but C. Bankeii is only found in the North Maland and in the northern fart of the South Island at far soulh ee Weacland. Sipwart Islard in atparated from the \(S\) suth Island of New Zealand by fureanx Strait, and bas a very interenting flora, containing many endemic plante of great beanty; it climate is mild and remarkably equable. Although the atmonphere is almost contantly astarated with moiacare, the actual rainfall is acarcely larger than that of Cook Strait, asy about 42 inches per annum.

An account of its flowering plants and Ferns was published in the Tramactions of the Niw Zealand
 is of enpecial intereat as forming the extreme southern liait of arborescent Ferns, which extend to the South Cape, lat. \(47^{\circ} 20^{\prime}\), instead of to \(45^{\circ} 50^{\prime}\), as unally atated in our text-books.

The tree Fefn on the right hand aide of the drawing is Dickennia equarrosa; the trees thown st the back ale the Kamahi, Weinmannia racemota. T. Kirk. Colonial Muewm, Wellington.

\section*{Vegetables.}

\section*{KITCHEN GARDEN CRUPS IN 1895.}

We may now compare note with previou years, and it is well to do so for futare kaidence. Io this dintrict we soffered somewhat everely from the extreme cold in Febraary, cot only so, tut the grcand was sendert unworkable till quite late, which prevented us from getting meny of the cropenown and planted at the time we should have preferred. April was a momewhat cold munth, there being only one night throughout it in which the thesmometer regiaterid over \(45^{\circ}\), and oaly two days that might be considered hot, or when the thermometer in the sade registered as many as \(7\left(t^{\circ}\right.\), the consequence being that vegetabies made but slow progrens during the whole time, and thin, together with the drawback of the previous two monthe, began to make thing look rather eeriouf. May was a very dry month, when only 014 of an inch of rain fell with ut, the same being the cate in June, when 0.36 fell, while Jaly was by far the wetteat mouth of the whole gear.

Asparague was by no means so plentifal as in some former years, while Peas affered so mach from the slug in April, that they made bat a poor thow for a long time, and were there!ore mach later than usual. Many of the varieties, however, did exceedingly well, even till the end of the meanon; particularly fine were Sutton's Late Queen, Veitch's Main Crop, and Eckford's Memorial. Caulifowern got well eatablished during the showery weather in April, and then prodeced bead, the like of wich
we have neldom had, all kind boing satisfactory alike. The first to turn in were Early Forcing from seed nown in pans early in January, and thene were followed by Walcheren that had been protected in a cold frame daring winter, and planted out in the open quarter at the end of March; after which Mammoth and Aatumn Giant that were rained on a alight hot-bed and planted out in April, the roots having time to take a good hold of the soil before the hot weather set in, and on that account, they did not bolt as did nome of the summer varieties planted out at the same time. We can therefore recommend this plan to others situated like ourselves with a certainty of saccess. Root crope of all kind are very good this meason. Carroty are excellent, particularly those that were not sown till late. With us, Carrots sown about the middle of June will uanally grow large enough even for exhibition by the end of September, and finer aamples need not be than those sown at that date this year, the bountiful thowers during the latter part of Jaly being jast the thing for them. Seed awn daring the aecond week of that month on ground that had been cleared of an early crop of Potatos, have produced a fine sample of aseful roots. Those who are troabled with the Carrot-maggot, and have to find supplien to carry them on through the winter, would do well to adopt this plan. For these late sowings we une Model, Intermediate, and Gem. Beet-root that were aown early have grown far too coarne, being more of the atamp of Mangel Warzels. Those who have good ground would do well to confine themmelves to growing the dark-leaved kindu, which need not be sown before the end of May or early in Jane. Seakale Beet is one of those usefal vegetables not so well known as it dererves to be, for at this season of the year, when both Beans and Peat outuide are over, and before forced Asparagus and Seakale come in, there is always something needed for a change, and few vegetable than thic, particularly if a good atrain be obtained, the parly-white leafatalk: being very tender. Globe Artichoken have done well this antumn, and continued forming heads from young plantations till they were cat down by the frost, which, with us, was very evere for about a week, there being \(14^{\circ}\) registered on the night of October 26, and \(11^{\circ}\) and \(10^{\circ}\) the two following morningu. Jerualem Artichoken, especiaily the white variety, have grown very atrong, and will, no doabt, prove useful during the coming winter.
Tarning to the winter green cropa, Brassele Sprout form the principal, as these continue to give a supply daring bad weather, when Broccoli outaide are cut down. There are now so many fine varieties that it in difficult to say which is bent. Those, however, who have good ground would do well to grow the smaller kindr, unlens the othera are planted late, as they grow far too large. With us it is seldom that Bruselela Sprout need is aown before the second week in April, and then a north border or open quarter is relctect on which to sow it, otherwine the plants would be too forward. Plenty of aprouts are then uoually ready for uae by the time Peas and Beans outside are getting over. Celery is a vegetable no much eatoemed ia mont places, that a good supply should always be had. Laat wintar, the one that withatood the froat beat with us was Major Clarke; thin fine molid variety when well grown, is hard to beat. Broccoli with us are not so good this seavo, the hot dry weather in September affecting them very mach, and if wo should have a severe winter, many of them will no doubt accacab. Borecoles are mach more bardy, and on that account ought to Sad more favour in our garden. There are some very useful kinds amongat these, ach as Al, Arctic, Favourite, and Exquinite. Hanner Beans have become no numeroa that one would almont wonder how more can be sdded, but when we come to connider that half-a-
dozen or co varieties may be had out of one pod, the dozen or co varieties may be had out of one pod, the marval is that they are kept motrue. A variety we grew this meason under the name of Exhibition, produced an abundance of atraight, well-shaped pods about 13 inches in length. We hope, therefore, to give it enother trial next meason. H. C. Primep, Suseex.

Walcheren Cauliflower.
Although I have cultivated everal varietien of Caalillower for wintering in frames and for an early sapply, I have so far foand none to be equal to the Walcheren, and were I limited to one variety, I would give my preference to that one when true. Early London Caulifower may be a few days earlier, but it is more apt to " button;" at least, that is my experience. It is a mistake to get these plants for frames too early, quite amall plants being bet. Lift and transplant them into frames, hand-glasses, or to a pot where hard frost can be warded off, and give the ail a gentle stir occanionally between them, and plenty of air at all times when there is no actual frost. It is seldom that they will then fail to turn in well about the firt week in Jane, earlier or later according to the season.

At all times Cauliflower should be planted where they are to form their heads, on deeply-trenched, well-manared land, and not left too close together. Walcheren ia more hardy than many, and is of a compact habit of growth. I alway plant them out at 7 inchea apart in frames for the winter. The Erfurt type is useful for sowing in pans in heat in late winter and early apring, and if duly attended to, it will come into ase at an early part of the summer, bat great care mast be taken they do not get a check, or nearly every plant will "button." H. Markhan, Kemt.

\section*{TME WeEk's Work.}

\section*{THIT ORCEID HOUSE8.}

By W. H. WHITE, Orchid Grower, Burford, Dorking.
HINTS ON CULTURE.-Plenty of light at all timea is necessary for the healthy growth of Orchids, and at this season more than at any other. The glass in all the Oichid-house should be kept clean by washing it inside and out. The wood-work should likewise come in for an occasional cleaning; a white, clean surface increases the light in the houses. Examine every plant for insects, and sponge the leaven with clear water; wash the pots, and kesp everything about the plants trim, clean, and tidy. Whiltt re-arranging the plants in the cool-houme, examine each for slugs, which are nearly alway preaent in the phaganm-mose, paring no trouble in getting rid of them; failure to do this will lead to nambers of young roots and ancculent flowerapike being lost. Lettuce leavea, mall shallow pana filled with brap, alice of Potato, \&c., are useful as baits for nlags, and thene should be placed on the atages and the moss, and often examined. When the flower-apikes of Odontoglosams push, a piece of rough wadding whould be wrapped around them, as over which slage seldom pans. As to Odontoglossums of the cool-house, the mejority are in full growth, and it will be noticed that at the base of many of the leading breaks there is a brown-coloured outer sheath, which sometime clasp the growth 10 tightly as to prevent the young roots from emerging, and it should be carefully ulit in several places, and palled off in amall pieces. Failure to do this causes the roote to come up inside the sheath into the air, and make no further progres, instead of the shagnam-moss. The plants of Miltonis vexillaria now growing freely will require similar attention, as also the new growthe, which should bo examined occanionally, and the tender young leaves that atick to each other and become crumpled gently separated from each other. Among Orchids of mall growth the pretty yellowflowered Oncidium cheirophorum in now opening it flowerw, and till the flower-spike is fully developed, the plant ahould be hang ap close to the roof-glass in the intermediate or Cattleys-house, so that it may obtain plenty of light. It is a plant that should be aparingly watered at all times, and especially daring the winter, or the paeado-bulbs and leaven will rapidly decay. After the flowers fade, the plant may be afforded rest by applying just afficient water to keep the peudo-bulba plump-looking, and when growth recommeaces fren material should be placed about the planto Shallow well-drained pani, with a thin layer of peat and sphagnum-moss to root in, suit this plant. Oncidiam. Phalænopais, cucallatum, olivaceam, and nubigenum, although their flower are small, are very lovely, and they keep freahlooking for meveral weeks; still, it is unadvisable to retain them on the plants too long, or they will nuffer in health. Like many other species of Oncidium, these fail in mome inntances to grow as atilsfactorily as their owners would with; and being
purely cool-house plants, they require a light ponition in the Odontoglomam-house, and plenty of water at all times. The ame kind of treatment will nit Mesonpinidium vulcanicam, M. sanguineam, Odon toglossum roseam, and Cuchlioda Noeziliana. Theme specien hould be potted rather high ap in wello drained pots filled with peat and sphagnam-mous, and the best time for repotting them in juat when root activity begins.

\section*{FRUITB UNDFR GLAS8.}

By Riohard Paricer, Gardener, Goodwood, Chichutre.
GENERAL WORK. -The practice of placingnumbera of plants of Chrysunthemams in every available finito
house is reprehensible, because it leads to sn im. proper treatment of the Vines, Peachen, Figa ime. permanently planted in them. For inftance, firsheat has to be used in frosty weather, the rentilation is also not what the Vinem, \&c., require, the borders are made anduly wet, and the surface trodden down and made impervions to the air. To lessen the evila of housing the Chrysanthemums as much an may be, they should be removed as soon at they are patitheir best, so that the freest ventilation may be afforded the permanent occupants, and the neceasary operation of cleaning, pruning, tying, \&c., pushed on without lous of time.
peaches and nectariner. -Treen in borden which will be atarted in December, will require to be thoroughly cleaned with soft-soap and hot-water or Gisharat Compound, or simply a weak nolution of tobacco-water, whichever may appear to be the more suitable. Having done this, and scrabbed sll moodwork, limewahed the walls, and rendered the glase clear and bright, the training of the tree may be proceeded with. This operation finished, the border! should be raked clear of rabbith and clod, and not distarbed with a digging-fork unless their hard condition render it necesnary, digging however shallom destroying many rootm aituated near the suriace; moreover, a firm soil is productive of the fingr rooth. A dreasing of freah loam 2 inches thick laid on the border will do much to encourage the roots to the surface, and will not promote grons growth. The hotwater-pipes, if not new, may require a coat of lamp-black and lineed oil (no turpentine), and to have valves and joint put into good order. The house thould be kept cool until forcing begin.

CUCUMBER8. - With short days and gloomy tiet growth geta less and leas vigorous, and aphiden, rad apider, and thripe attack the foliage, rendering mach attention necessary to keep their nambers so low that but little injury is done by them. A mild famigation once a week with the XL All Vaporiser will ched aphides, \&c., which is a safe means. Guard agsinu high temperatures with their consequent dry sir, which should be avoided, as red-apider and thriparo not then so mach encoaraged. Some fresh honk dung apread on the borders occasionally
ficial effect on the growth of the planti.

\section*{THES ELOWIR GARDIIN.}

By Bailes Wadds. Gardener, Birdsall Gardeur, Xork
PLEABURE GROUNDB.-Now that the graster portion of the foliage has fallen, much sweeping be lawns and walk is entailed, and which caniof bidy neglected if the garden is to have a neat and be appearance. wheeled to the whea to the leaf-heap at once, all to leave hoold is to bave to do the work over again. aways be three heaps of leaves: that which is ald and therefore in a state of mould; that which in low decayed; and lantly, the freahly-fallen lempan The autumn, whilat frotim are not intense, mas bo utilised in taking up the tarf on aneven laminh making the land level by digging it a fer incha deep, and then levelling it, or by the addicarf. woil. Make it quite firm before relaying the kufl, When worm-casts are so numerous at to be uaigus choone a dry day for aweeping them ap, and thea light wood roller uned frequently for the parpow keeping them down. Poor grass whould recin o dressing of charred garden-refuse, quickimat rather freah-slaked lime and loam, which will gro and improve it. If put on the turf on a dry daj, it is brashed or raked about, and afterward yollon, lam readily distributed regularly. No wor should be carried on in fronty weather.

WALK8 AND ROADE hould have the edgingh when these consint of tarf, neatly cut, and the mata and of which the walk or road is made woface ghat rolled after rain, or whenever the suria now be
loosened. The regravelling of walke miy undertaken, and old gravel may be turned and tho
arface made good again. In parte of the country in which gravel in not cheaply obtainable, the road are made of flint or Macadam and ea-gravel or mand ; and such walks and roads should not be dag up or disturbed, but be dressed with Weed-Kıler, or weeded by hand, made level, and rolled once a week. When much now has fallen, do not sweep the gravel walks, but use sriangular anow-ploughs of various sizen. The broom throw the mall atonea and grit on to the laws and grase vergen, to the detriment of the mowing-machine.

FLOWER-BED8 which will not be planted till the apring should be deeply dag, and the surface left in ar rough state.

Charaina REFUSE,-On dry dayn, burn in a mothered or open fire the pruninga of trees and shrubs and other garden refase, pasning the ashes when cold through a wire acreen or coarse-meahed sieve. Thi fine powdery material is excellent for
mixing with the potting soil in which Pelargoniams mixing with the potting soil in which Pelargonium:
and other bedding planta are grown, an also when mixed with manure a dreange for the Rose beds and herbaceous bordern. Compost for a variety of parposes may be got together at this season, throwing the materials into conical heap, so that they may not become unduly moiat. When the weather permitn, the digging, carting, and atacking loam and peat, sand, \&c., for fature use, may be proceeded with. The decaying leafheap may be aifted, and the uable portion put under cover in readiness for use, the reat being again thrown into a heap to decay atill further.

\section*{PLANTS UNDER GLASE.}

By W. H. Smitr, Gardener, Wast Deas Park, Chiehester.
THE FORCINQ-HOUBE.-Batchen of Lilac. Lily of the Valley, early varieties of Tulips, Dentzia gracilia,'Spirma, Tea and other Rones, Weigela (ronea and othera), Azalea indica, A. mollis, hybrid Rhododendrons, Hydrangea hortensie and H. paniculata, Staphylea colchica, Choiaya ternata, Dielytra spectabilip, and the doable-flowered variety of Prunues minenis. All plants, excepting Lily of the Valley should be syringed overhead three or four time daily, less or more according to the weather, and the air of the hnace maintained in a moist atate. Balba of Roman Hyacinthe and other plant now coming into flower hould be less ayringed, and removed into a slightiy less warm-house, for the purpose of inuring them to bear the temperature of the conservatory and apartments. In eatablishments requiring great quantities of cut bloom, Narciasua, Tulips, Lily of the Valley, Roman Hyacinthu, Freesias, and Helleborus niger should be planted in saitable boxes, with a view to economising apace in the forcing-house, Rhododendrons may atill be lifted from the open ground, and potted in leaf-mould and peat. A Peach-house juat tarted ia a capital place for the forcing of Lilacs, Kalmias, Gueldres Rose, \&c., which are plante that should be very gradually forced into bloom at this season. The temperature of the ordinary forcing house should be \(60^{\circ}\) at night, less in very cold weather, \(70^{\circ}\) by das in cloudy weather, and \(75^{\circ}\) or higher with sun-heat. Lily of the Valley requires a botiom-heat of \(85^{\circ}\), and to be forced in darkness, crowns being employed, not clumpr, which do well enough after February. Only force Azaleas, Rhododendrons, Lilacn, and Sitaphylea which posen prominent flower-bada, or which have been suitably prepared. The watering-can must be carefully ased, applying no more root-moisture than affices to keep the ball moderately moiat, or excesaive leaf and hoot-growth will occar, to the detriment of the appearance of the plants. If the shoots atart to grow on Azalea indica and Rhododendron, pinch them back or break them out.

CARNATION SOUVENIR DE LA MALMAIBON.When early bloom: are wanted, some of the forwardeat plants shoald be placed in a house with a temperatare of \(55^{\circ}\) by day to \(50^{\circ}\) by night. Only those plant which are throwing up a flower-stem should be chosen at this date. Afford a light overhead syringing in bright weather, and examine them for aigna of the Carnation disease, catting off all affected parts as soon as detected, and burning them. Famigation mould be resorted to once in three or four weeks. as means of checking the increase of aphidea. Young atock of thil variety of Caraation hould not receipe too much water at this seaton, and if the plantis can be plauged in Cocos-nat fibre refuse, they will acarcely need any water. It is anfer to err in affording too little than too mach water. A good place for the plants in the winter is a low pit to which artificial heat can be applied, and which
should be ased in very damp or frosty weather. If young plants affected with the spot disease (Cladomporiam) are carefally examined once in three weeks, and all affected parts removed with the knife, the plante neually grow out of it.

EUCHARI8 GRANDIFLORA.-The flower-spikes in mont cases should be pushing up, and copious rootwatering, togetber with the use of liquid-manure occasionally, must be resorted to. Ai a mild kind of manare, I can advise the une of soot-water, if made weak, for keeping the leavea of a deep green colour. The house ahould be kept in a moist condition, and be ayringed twice or thrice a day. If the bed in which the potfuls of balbi are plunged in getting deficient in heat, wome fresh stable-litter and tree leaves in a fermented atate should be added to the old materials. It is an easy matter to keep the air of the house cooler if the blossome come in at too early a date.

\section*{THE HARDY FRUIT GARDEN.}

By W. Pope, Gardener. Highchere Cantle, Newbury.
PRUNING AND NAILING FRUIT TREE8.-The work of pruaing and nailing, or otherwise securing the branchea and hoots, hould be pushed forward, whenever practicable, instead of being (as ie often the case) postponed till the colder days of midwinter, it being poasible for the work to be done with lean discomfort than at that season. The Cherry, Pear, and Plum trees should be first taken in band, following with Apple, small fruit busbes, and lastly, the Apricot, Peach, and Nectarine, the nailing, \&cc., of these being uaally deferred to the spring month for the ake of omewhat retarding their fowering. If the treen were properly attended to in the matters of pinching and regulating the hoot daring the summer and early autumn months, but little praning will now be required. The side eshoot of the weet Cherrie that were hortened back in the month of August to 6 or 8 inches, should now be atill further reduced, leaving two or three bude on the base of each. In doing this make a short clean cat from below the terminal bud, but not so close as to endanger it. Look well to ties, bred, and naile, and see that no aail is close enough to the rind as to be a cause of canker. All of the larger branchea should be secured with racher large and noft tarredatring, with plenty of space allowed for the awelling of the shoots. Shoots for extending the ares covered with the treen may be fastened with shreds and nails or ties of well twisted bast. The shoote of newlyplanted trees should not be shortened at this neason, but loosely fatened to the walls or to atakes, so as not to interfere with the eettlement of the plant in the noil of the border. Prane sach plante in the apring before growth has begun.
pruning and training out-door grape VINE8.-These Vines ahould be pruned as soon as the leaven have fallen, early pruning being eapecially called for if large branches are removed to make apace for the accommodation of young thoots, of which some ahould be laid in yearly. Such old wood, if not taken off in good time, is liable to "bleed" excessively when the ap rises in the pring. to the detriment of the Vine. To still further gaserd against "bleeding," it is advisable to dreas all largo wound with etyptic, or pacent knotsing, when the wood is dry, so as to clowe the cells. In ordinary praning, cut to a stont plamp bad near the base of the lateral bhont, long apars not beiag deairable in these Vines. In training the main rods on walla, the intervening apacen should not be less than 2 feet in width, and fasten these rod with tout tarred-string or leather atripa. If an increase of the atock of Vines be wished for, cattings from 9 to 12 inches in length, taken off with a heel, hoald be choen; cutting the buds out of the part to be inserted in the soil, and leaving one or two on that part that is above it, and inserting them where it is wished to have Vinen-or, they may be pat into a cutting-bed and tranaferred when just about to atart into growth the second year.

\section*{THE KITCHEN GAHDEN.}

By John Lambirt, Gardencr. Powis Cautle, Welshpool.
THE GLOBE ARTICHOKE.-The plants of the Artichoke, owing to much rain having fallen on a noil abnormally warm, were an they were cat off by froat. Being so green and oft, there ia the more reamon for well protecting them againut injary by hard frost. After removing all the atem that have borne flowerheads, and a few of the leaver, afford the land a drassing of rich farmyard manare, forking it in lightly, and afterward place atable-litter or tree eave around the plants to a depth of not lens than

8 inches, making this secure by apreading a little noil over it. When the tope are quite decayed, remove them, and cover the remaiader of the plant, in very nevere weather with light litter, removiag thia material on mild day.
the jerusalem artichoke. - These ahould be left in the ground till towards the end of the year, the steme being cut off at 3 inche above the ground. Lay them evenly over the soil, which they will serve to protect from fromt; or if that be thought too slight a covering, wome long litter may be ueed. The topa this meavon are very trong, and almost all have flowered. When lifting the crop generally of for current use, carefully pick out thoes intended for consumption-that is, the beat and largeat-and select the tubers of a fair nize and good ahape for next year' set. The white-tubered variety hat the nicest shape, and it is a good cropper as well as an improved variety.

PEAB. Where seed is not as yet sown out-ofdoors, the matter hould be: borne in mind, and a dry day choen for getting it into the ground. The well-drained early lea crop thould be, if posithle, a well-drained soath border, which should be dressed with well-decayed manare or leaf-mould before digging or bastard-trenching it. The drill ahould be about 8 inchen wide, and before and after the Pear are sown, aifted refuse-soil from beneath the pottingbench should be placed in thedrilis; a covering of the depth of 1 inch of the ataple will be anficient, making in all a covering of about 2 inches in depth. Above each drill a half-inch layer of tine coal-ashes may be placed as a deterrent to the sluga. The distance at which the drills are drawn will depend on the height to which the variety of Pea grows ; and Dr. Maclean, Sangater's No. 1, Veitch's Chelsea Gem, Dickmon's Firat and Beat, and Sutton's Improved Ringleader are excellent as early Peas. Mice muat be trapped, or the seed rolled in mixtare of redlead and petroleum before sowing.
broad beans.-A mowing of the Mazagan and Beck's Dwarf Green Grm varietie may nuw be mado wher the ground is not too rooist to be trodden upon. Sow either in drills, or dibble in, the diatance at which the rown stand apart being determined according to the parposes the ground between them may be put to, and whether large or mall-growing orops, or none at all, are to bo grown in the apaces. In wet land, ridges hould be thrown up, and the drills drawn either on the top or at the sides of the same and as soon as the young plants appear, afforded protection by drawias the wil ap to them, and placing branches of the common Yew or Fir on either side of the rown.

A New Perfume Oil-Under the name of "Kuromoji," the essential oil of Lindera sericea, is stated by the Chemist and Druggist, to be alowly acquiring some degree of popularity among manufacturing perfumers. Several lots, it seems, have recently pased through the Liverpool market, and gone into consumption. It having been noticed by some of the buger that the everal parcele of oil differ in odour from one another, enquirien were set on foot to discover the cause, and these enquirien bave elicited the fact that the Karomoji oil is not produced on a large scale by essential oul distillere, bat by amall farmera in Japan, each of whom distila the yield of the shrab growing on bie own eatate. These small tocks are then bought up by dealers in various centres, and mixed together, almont precluding the ponibility of getting exact uniformity in aroma. The oil is obtained from the young shoot and leaves of the plant, which is a Laurineons ahrab of from 4 to 6 feet high, growing in the monntainous diatricte of Japan. The old wood is mach used for making toothpick. The oil, which has a plesant, aromatic, balwamic odour, is of much value in perfamery, especially for toap making. It is atated to have been introduced into Earope in 1889. Oa the authority of the ame journal from which the foregoing is gathered, referring to the interruption, owing to the war, of the Camphor trade of Japan and Formona, it is asid that effort are being made to get Ceylon planters to take up the caltivation of the Camphor tree, a few apecimens of which have been growing for some years in the botanical garden of the island. It is thought that in the parte of Ceylon where the climate in comparatively dry Cumphor trees would be a profitabla cultare. The great objection from a planting point of view, is of course, the loug time which mast elapse ibefore the tree become productive; but the seme objection was raised years ago against the caltivation of Cinchons.

\section*{EDITORIAL NOTICES.}

Advertinementes should be sent to the PUBLISBER.
Newapapers.-Corresponients sending newspapers should be carsful to mark the paragraphs they wish the Editor to ses.
HIastrattons.-The Editor will thaniffuly receive and seled photographs or drawings, suitable for reproduction in these pages, of gardens, or of remarkable plants, flowers, trees, dc.; but he cannot be responsible for loss or injury.

APPOINTMENTS FOR THE ENSUING WEEK.

MEET\|NGS.
GATURDAY, Not. 23-Eoyal Botamic Society.

CORRECTED AVERAGE TEMPERATURE FOR THE ENSUING WEEK, DEDUCED FROM THE OBSERVATIONS OF FORTY-THAEE YEARS, AT CHISWICK.-41号.

Thr Royal Botacic Society seems
The "Botanic." to have fallen upon evil times, and to be going through a crisis similar to that whioh befell the Royal Hortioultural Sooiety few yeara ago. Other points of aimlarity between the two Societies may be found in the retirement of the Superintendents in both cases, and in the abolition of the office of gardenmanager at the "Park."

We see that applioation is to be made to Government for a pecuniary subsidy to aid in oarrying on the work of the garden. We do not wish to undervalue the worl of the Society, but we imagine that before such an application oan be entertained, the society must be able to show some reason for the allotment of a portion of the national revenue for its support. The garden is charming, the houses contain some interesting plants, and useful work has for years been done in supplying students with specimens. As for the flower-shows, they have become so stereotyped that it is not a difficult matter for the reporters for the prese to concoot a sufficiently acourate report of any particular show by referring to the account given of the corresponding show the year before, An inspection of the prizelist, to see if perchanoe any new exhibitor is forthooming, is nearly all that is necessary, as we know from experience. The policy of the Sooiety, hitherto, has been to exolude the publio by a high rate of subsoription, to pander to fashion by evening fêtes, and even to descend to frivolitien, appropriate enough in a tea-garden, but quite unsuited to a Sooiety onlling itsell Botanic. The resalt of similar prooedures was badly exemplifed some jeare sinoe at the Royal Hortioultural Society, whioh, however, never
sank quite so low as to offer prizes for the decoration of donkeys. We have not a word to say against such diversions in their proper places and st saitable times, dulce est desipere in loco, but we demar to any portion of the taxes being devoted to their promotion; and we protest against the incongruousness of mixing up such amusements with the parsuit of horticultare, and still more with that of botany!

The work that the Royal Botanic Society has done for botany is not large; and as for hortioulture, it must be admitted that the influence it has exerted, and still exerts, is quite inconsiderable, as compared with that exercised by the sister society. If any Government aid is to be granted at all, it should be given first, and in fullest measure, to that society whose record is, in spite of many vicissitudes, and occasional backsliding, so highly honourable to it.

The royal horticultural Society.-The next Fruit and Fioral Meeting of the Royal Horticultural Society will be held on Tuenday, November 26, in the Drill Hall, James Street, Victoria Sbreet, Westminster; and at 3 PM , a lecture will be given by Mr. James Mason on "Asparagus Culture." The committeen will meet as unall at \(120^{\prime}\) Clock.

Horticultural Club.-The anal monthly meeting and conversazione took place on Taenday evening, November 12; the chair wan occupied by Mr. Geongr Paul. There were present Meare. Philip Crowley, H. Selfe Leonard, Geo. Monro, Petbr Kay, H. Tubner, J. Walker, \&c. Aa addrese was given by Mr. D. T. Fish, on "Flowere, Fruits and Plante in the Life and in the Home," it ranged over a wide area and many interenting facta were brought forward ; at it conclusion hearty vote of thanks wat proposed by the chairman. The table was decorated with Chryanthemum from the Royal Narseries, Slough; and some dishe of wellgrown fruit of Emile d'Heyat Pear were added to the deamert by the kindnene of Mr. Jambs Walierb.

National Roge Society.-A prize of five guineas, prenented by Alexander Hill Grax, Eiq. will be awarded by the above Society for the beat easay on the "Hybridisation of Romes." Intending competitorn are requented to forward their enays to one of the Hon. Secretarien-H. Honeywood D'Ombrain, Weatwell Vicarage, Ashford, Kent; Edward Mawley, Rosebank, Berkhamated, Herts, on or before March 1, 1896.

National Chrysanthemum Society.-The General Committee met at Anderton': Hotel, Fleet Street, on the 185h inst., Mr. B. Winne presiding. The Secretary reported some correapondence he had with Mr. J. Rrtchie, the chairman of the Royal Aquarium Society in reference to the imperfect lighting of the bailding on the occaaion of the exhibition at the Aquarium, eapecially in the matter of lighting up earlier in the day; and an amendment wa promised in respect of this matter. The Secretary also reported, that in addition to the Challenge and other Capn, Medals, \&c. the money prizen awarded at the November how amounted to \(£ 245148\), and he read a liat of the medals awarded to mircellaneons mabject by the arbitration committee, all of which were paseed ; an interim financial atatement was abmitted of a decidedly atiafactory character, the Secretary reporting that the chequea for the November prize-money would be cent out within the next ten days. A atatement was made on behalf of the Catalogue revising committtee by Mr. C. Hamman Payne, aetting forth the courne determined upon by that bods. A start would be made from the Catalogue isured at the time of the Centenary Celebration in 1890, thns superseding the two Sapplemental Catalogue issued in 1892 and 1891; a new alphabetical arrangement will be made, and the servicen of some thirty experta reaiding in variout parta of the country will be requented to
assint in compiling eelections of the beat varietien in their several sections. If is proposed to insue tha Catalogue in September, 1896. Three now Fellow and twenty-two member were elected. The nsual vote of thanks to the chairman closed the proceedingal

Botanical Magazine.-The planta figurid and dencribed in the November number are:-

Angrecum Kotschyii, Rchb. f., in Gardeners' Chronicle, 1880, ii., p. 456 and p. 693, fig. 131.-A native of Eatern Tropical Africa. The pendolons racemes have numeroun white long-spurred flowert, each abous \(2 \frac{1}{2}\) inches across. Sir Trevor Lawrence; \(t_{0} 742\).

Spathoglottis Kimballiana, Hort. Sander.-A native of Borneo. Leave 5-7 nerved, 4 ant, ( \(1 \frac{1}{2}\) incb) broad; flowers 8 cent. ( 3 incher) actos, egment oblong ovate, rather obtuse, pare yellon, internally red, mottled externally, lateral lobeu of lip ear-mhaped. Flowered at Kew; t. 7443.

Catasetum Lemosii, Rolfe, in Kew Bulletin (1894), 394.-A native of Hede Marago, Province of Pan, where it wan diacovered by Dr. Lemor. Flowers greenish, male only known; t. 744.

Amasonia erecta var. late bracteata.-A Verbenaceous shrub, native of Tropical Suath Amarich, and remarkable for its orate, rose-coloured bract, from the axils of which proceed short racemes of pendulous flower, with a cylindrical narrow tabe, and an irregularly 5 -lobed limb, with short white segments, traversed by pink veins. Introduced by Mearr. Sander; t. 7445.

Selenipenium Sargentianum, Rolfe, in Orehid Ro. view (1893), p. 239; Gardeners' Chronicle. 1891, ui, 781, f. 100. F. Sander; t. 7746.

The Book Gardener.-"In my younger dajni," writen Mr. Mrehan, "progremaive young men mero often informed by the eminently practical youth that he could grow Potatos just as well withoat any knowledge of the countrie they came from, the true nature of a taber, or the differences between a Cabbage and a Cauliflower. In many caser they could do so, but it was interesting to note as the years rolled by that while these excellent practical men never rose above raising Potatom and Cabbages, mont of thone with a broader education became eminent and usefal members of eciety." In the asme number of Meehans' Monthly from which we have taken the above, is a story of a practical gardewer twitting a companion who was reading his Mechans' Monthly, with, " Ob , is that the art of gardener jol are? a book-gardener;" and then comer the mond. The unthiaking man never advanced in hir proferaion. He is practical still-as the spade and the shovel.

The Reigate ano District Chrysanthe MUM SOcIETY. -This vigorous Society hat beta unfortunate this year in holding its show on a met day (November 8), and in consequence saffering ? considerable diminution in it gate-money. This is the more to be regretted from the fact, that the Society hands over each year a certain aum of mond to the Rojal Gardenera' Benevolent Intitution, and Royal Gardenera' Orphen Fund. In point of axcollence the exhibits equalled those of any preriont year-groupn, cut bloomn, and plants, being captes.

Campanula mirabilis.-Under thir name y Correvon speaka in the Revue Horticole of a specia diacovered in the Caucasus by M. Albofr, ad described in the Bulletin de bherbior Boistier, 5 , n. 5. It in dencribed an an exceptionally beatititu apecien, clonely allied to C. medinm, and gromivs naturally on calcareous soil. It is aupposed to bo 1 arvival from some previon geological era, mont of the representative of which have vanished, 4 Correvon has seedlings, no that we may hope in time to make the acquaintance of this wonderfil Campanala.

The surveyora' institution. - The asi ordiaary general meeting will be held on Moudal, November 25, when a paper will be read by No. R. M. D. Saunders (Fellow), on "Landlorde al Tenante in Ireland." The chair to be taket al 8 o'elock.

Meeting of the Bruseels Orchidéenne.The meeting held on Nov. 10 was a mont intereating one, and largely attended. Among the vieitore was M. L. de Bboyn, the Minister of Agriculture, who rarely fails to attend the monthly meetings of this society. Among the more remarkable
for the first time in 1894. These detaile, farnished by the exhibitor, are given in hopes that othere may follow his example. C. x Mantini obtained airatclan Diploma of Honour. M. Flor, Pauwels ataged a splendid Cypripediam Charlenworthi, the atandard of which is unurual in development and colouring;
aplendid Vaada Sanderiana, with two truaes, one of five, the other of eight fine blooms; and Oncidium Forbesi, with a pretty truss of benutifully tinted floweri. Md. Trieu de Terdonck showed Cypripediam nitens, which wae very beautiful. M. Knight, Director of the Rojal Parks, staged a large epecimen of Catt-

Fig. 101--catasetcar chbistyanum : flowess, ceccolate bown with anex hip. (ber 8. 618.)

Orchid I may mention the following:-From M. Georgen Mantin, Châseau de Bolair (Loiret): flowers of the hybrid Cattleya \(\times\) Mantini (G. Mantin) \(=\) C. Skinneri (Bateman), var. Bowringiana (Veitch), aub-var. floribund colorate (G. Mantin), \(\times\) C. labiata (LindJ.), var. Dowiana (Batem.), mub-var. aurea (Williams), fortilised in October, 1889, fowered in October, 1890, nown in Nevember, 1890, bloomed
M. Stepman nhowed a group of C. Charienmorthi, comprining six specimens, one of which bore an unuamally dark standard. M. Liaden aent a vory fing example of C. regale; apscimen of C. insigue montanm Lindenw, of jellow colour, mach admired by connoiseurn; Cattleya Warocqueana, bearing a great resemblance to C.gigas; C.marima gigantea, with the petala veined with parple; a

Jeya Warocqueans, a the variety with thirty flowert. M. de Lombaerdi went a beautifal C. aurea; M. Warocque, C. Warocqueana fulgens, of a pretty deep rose colour; M. Madoux, C. Gaskelliana, of a dietinet ahade of pale coloaring: MM. Lacien Linden et Cies, cat lowers of C. Triacoi, very good varieties; M. Van Imehoot, C. Warocqueans marmorata, of a beautiful dark colour, and with all the divisions of
the flowers indiatinctly atreaked; and Laslia Lawrenceana (Botanical Certificate). M. Madoux aloo ataged a Laxio-Cattleya apecier, with division of unuanal width and beautiful coloaring; M. Coppena, a very diatinct Cattleya Eldorado alba. In the houses of l'Horticulture Internationale there are now in bloom numerous varieties of C. maxima gigantea, C. Warocqueana, C. gigan, Catasetum, and Mormodes. Ch. D. B.

Technical Education,-A coarse of four lectures on the caltivation of vegetables and frait was concladed on Monday evening latt at the Public Hall, Fawley, under the auspices of the Hampshire C. C. The lecturer, Mr. Garner, of Cadland Gardens, Southampton, illustrated hia lecture with diagrams, showing both good and bad epecimens of vegetables, aleo the right and wrong way of pruning both the brancher and roots of fruit trees, as atandards, bushes, and enpaliers. The winter treatment of soils and it preparation for the reception of seed in apring was explained, and the economical uees and application of manures of different kinds were with the above listened to by a large attendance of the public at each lecture.

Requlations at the Drill-hall. - In reference to a note on this subject on p. 587, it is pointed out that our correapondent has been misinformed. The rule which is generally observed, and oaly occanionally infringed by inadvertence, is that the entry-carde are not brought up to the table, so that the committee is anpposed not to know, and often does not know, apon whone exhibit they are adjudicating. We can confirm this in the came of the Orchid Committee, where the chairman exercisea care to prevent the entry-card being seen till after a decision is arrived at. "Firat-clasn Certificates" are confined to new and rare plants, and are not given to floriste' flowera unleas they reprenent an entirely new type. "Awarde of Merit" only are given to ordinary seedinge, \&c. Some arrangement should be made to preclude mambera of the Committoen neeing the exhibita before the meetingg.

Newcastle and District Horticultural Mutual Improvement Society.-The monthly meeting of this nociety was held at 25, Weatgate Road, on Tuenday evening, Nor. 12, Mr. John Bullock occupied the chair, and there was a good attendance of membera. Among the upecimens exhibited on the table was a collection of Apples from Mr. Todd, care of Memra. Watson \& Co., nurserymen ; Carymanthemum bloome by Mr. Larar, Northdene, Gateshead ; and three aplendid pots of Cyclamen by Mr. Lawson, Heathdale, Gouforth, all of which were mach admired. Mr. Lawson, Heathdale, read a practical paper on the Onion, which was followed by discustion.

\section*{Shirley and Surbounding Dibtaicts Gar-} deners' and Amateurs' Mutual improvement Association,-The monthly meeting was held at the Parish Room, Shirley, Southampton, on the 18 ch inati, when Mr. E. J. Wiloox presided over a good attendance of the members. The "Caltare of the Muhhroom" was the title of a paper read by Mr. F. D. Woole, of Totton, who in a grower for market of mome experience. A long and interesting diecasaion followed, and a hearty vots of thanke to Mr. Woolf closed the proceeding,

Kew in September.-The fine weather in September iaduced many pernona to visit the gardens. On Sanday, September 22, the number reached 22,42\%. The highest shade temperature in September was \(28.8^{\circ} \mathrm{C}\)., ( \(8 \pm^{\circ} \mathrm{F}\).), on the 24 th . It was remarkable as following a minimum on the grass of \(0.55^{\circ} \mathrm{C} .,\left(31^{\circ} \mathrm{F}.\right)\). This, esya the Kew Bulletin, gives a range of temperature during the tweaty-four hourn of \(53^{\circ} \mathrm{F}\). The hot weather lasted exactly a week, the maximum temperature never falling below \(244^{\circ} \mathrm{C}\). \(\left(76^{\circ} \mathrm{F}\right.\) ), from the 23 rd to the 30 th.

Caube of "Finger-and-Toe" in Turnipb.The connection of an attack of "Finger-and-Toe" in Tarnips, \&c. with a previous impoverishment of the soil in lime, is woll shown by two noil analysea
juat completed at the Soath Eastern Agricaltural College, Wye (County Conncils of Kent and Sarrey). One portion of a 16 -acre field in the south of Kent was badly affected by "Finger-and-Toe," the rest being only elightly attacked. Samples of the soil taken from that part of the field where the dinease was prevalent, showed on analysis only 13 per cent. of available lime, while the soil from the rest of the field contained 43 per cent. Wherever " Finger-andToe" (Anbury or Club Root) showa itnelf, the land probably wants a dreasing of chalk or lime.

Professor Hellriegel.-The death of Profemor Hermann Helleigari, at the age of nixtyfour, removes the discoverer of the important fact that leguminous plants are capable of absorbing free nitrogen from the air, through the agency of microorganiams existing in the nodules on their roots. Dariag his career he devoted his attention almost exclusively to researchen dealing with chemical and physiological questiona relating to the natrition of plants. For some years he acted as director of the agricultural experiment station at Dahme, Brandenbarg, and after occupping other position, made the great discovery of his life at the experimental station founded by the Verein für Zacker-Induatrie, jointly with the government of the Dachy of Anhalt. Pharmacentical Journal.

Dwarf Form of Lillum auratum. -Mr . L. Comaing of Eastrield, Ragby, sends us a photograph of some plante of Liliam auratam growing only a foot high, and bearing well-developed flowers. The buibs were imported onen, and now, when in bloom, manifest no trace of weakliness or anhealthiness, the only unusual feature being the shortnem of the atem. Mr. Comming quentions whether this habit woald bo of permanent character, and if a aimilar peculiarity has been observed in other Lilies of this variety. The dwarf habit would have, for certain positions, a value of ite own, and such plants would prove a welcome addition to thone already known to un.
"Rubber."-A new woarce of thim precious material is brought under notice in the last number of the Kew Bulletin, where an Apocynaceous plant, Kickxia africana, is figured. This is one of the mont beautifal foreat trees of western tropical Africa. The rubber it produces is of high quality. A very important rubber industry was asarted at the Gold Coast by Governor Moloney in \(188 \%\) and ten yeare after the exports are noted as amounting to the annual value of \(£ 200,000-\) - remarkable and atriking inatance of the creation of a new indactry by official action. Similar meanarea have been taken at Lagor, in which colony the tree above mentioned grows. Iadeed, it extends from Sierra Leone to the Gold Coast, and beyond the banke of the Niger to the Bight of Biafra. The development of the rubber induatry at Lago is shown by the circumatance that in January the weight, in roand figarea, was \(21,000 \mathrm{lb}\)., the amount gradually increasing till in Jane of the same year the weight exported was upwards of \(268,000 \mathrm{lb}\)., and the value over \(£ 12,000\).
"Orchide, their Culture ano Manage-MENT."-A *econd edition of Mr. Watson's useful treaties hat jast been published by Mr. Upcotr Gilis, 170, Strand. This is a book apecially muitable for amateurs and beginners. The general principles of cultivation are clearly laid down, and if the grower once graeps these intelligently, the rest is a queation of attention merely. The arrangement of the genera is alphabetical, and alight descriptions are given of the most noteworthy species. The book is copiously illustrated, and well fulfill its object.
"Orchid Guide Book."-Mr. H. A. Burberry hat juat published a accond edition of his work, entitled, The 4 matewr Orchid Cultivators' Guide Book. We commend it to growers and to would-be grower: as a aimple and reliable aathority. It is not too mach encurabered by noten about floriats' verietien of Orchids, but given clear dencriptions of the sorts best maited for cultivation, and the means to be adopted to succeed with them, It in illuatrated with
coloured and other platea, and im of handy aize ; thiu, the new edition, being altogether an enlarged asd
improved one. proved one.
Synoptical Flora of North America, The first fascicle of thie work (prepared at the herbarium of Harvard University), in contianation of that commenced by the late Dr. Asa Gray and Dr. Watson, and, on the death of the latter, by \(D_{f_{0}}\) Robinson, is now ready, and incladen the orders Ranunculacem to Frankeniaceæs. A necond fanciello, dealing with the orders Caryophylliceee to Poly. gonaceex, was begun by Dr. Asa Grar, and is being continued by Dr. Robisson (the Editor), ansiated by Professor J. M. Cocirre, Profenor William Trelease, and Profemor L. H. Baiuz, This part is in adranced preparation, and will be issued at an early date.

\section*{CATASETUM CHRISTYANUM. (Fic. 104.)}

Thil remarkable apeciea was originally dencribed by the late Profensor Rsichenbach in the Gardemerd' Chronicle, May 6. 1882, when he mention ith affinity to the less showy C. saccatum, Lindl. It in, indeed, perhaps the most extraordinary of a lerge section of the genus Catasetum, having the curious bearded or fringed lip, and which invarisbly attract considerable attention when in flower, no matter how many thowier thing may be in bloom at the time in the ame house. For a long time the plant was very scarce, but recently Moserc. F. Sander \& Co. have imported it, and our illustration wat prepared from a plant exhibited by them at the meeting of the Royal Horticultaral Society, 0et. 29, 1895. In colour C. Christyanam varies in the different specimens, the sepale and petala being uaually chocolate colour, and the lip greenish-yellon, with dark parple fringe; but in some the petalia are alightly freckled with green. It is pleasant to notethas in several collections the Catasetumsaregiven a proper amount of attention, and in each case they amply reward their caltivatora with their aingular flowen.
There appearn to be but little difficulty in groming Cataseta if the proper cool reating easaon after the leaves wither in observed. It was the neglect of this which upjastly got for them, in former timet, the character of being difficult nabjects to grow.

\section*{ABOUT CHRYSANTHEMUMS.}

\section*{(Continued from p. 580.)}
at Castla Hill Nugsbries, MadbrneedoAfter a journey to wee Mr. R. Ower's collection at these narseries, we have a very good opinion of many seedlings now in bloom. Possibly nome weeding out hat already been done-though we do not know thin to be the case ; but whether or not, the percentige of promising varieties among the unnamed needling appeared to be good-certainly higher than that which usally rewards the raiser of new Chrganatheo mums. Mr. O wen has a few nice span-roofed houther, in which the plants are aheltered; and thought there of is consequently no effort made to mase the mhole of the plante to produce a general effect, the display in each hoase is by no means inconoiderable.
The firat novelty to be noticed wan a aport from Robert Petfield, which has been called Chas. High, As far as could be seen, this is a aport in respectit to colour only, the habit of growth of the plantand the quality of the bloom will probably be about equal to the type. In colour, the bloom is pale rosyo purple, and on the reverse side the petale are golid of bronzy at the tips. Whilst speaking of inccurrode mention should be made of Mre. R. C. Kingaton, one of the very largest of the newer incurveds. The florets are not broad, but the flower is high and goow colour full rose tipped with white。 Chas. H, Cartil (H. J. Jonen) was noticed in more excellent form thin we have seen it on the plant previoualy. Copper King is a promising needling from America, flowars deep bat not very large ; and Misa E. Smich, an incurred and twiated Japanese, a pretty mixture of niver and rone. Lady Ridgway is an English seading of marm buff, base of the fiorets rone coloured, the flower globular, florets not long but very numeronis. Mra

Higginbotham is a first-clana, large, hairy variety of rony-lilac and silver, Pride of Maidenhead, a longpetalled loose Japanese, white with lemon centre. Jao. Lightioot, a silver-coloared Japanese, with lilac-rose-margined florets, gradually apreading over name as the llower develops; floret forked. Certifi cated by the National Society on the 11th inst.

Amongat a number of unnamed seedlinge was noticed a very wide-petalled Japanese, slightly twiated, and an incurped Japanese white, both of which were full of promise. Graphic is a Japanene incurved with a very large flower, and broad florets, upper aurface striped rose, below milvery. A seedling Anemone-flowered variety from America, pale lilac in colour, lacking grace; and Freedom, an American seedling, Japanese of warm blush, wero noticed; and two Continental introduction are Madame Lebeque (Chantrier), a globular Japaneae reflexed, white, with amber-coloured centre, when fresh; and Dame Blanche (Crozy), a white, amooth Japanese, in the instance under notice, having more yellow on the otherwise white flowers than we had previouly seen.

\section*{At Dover House, Romhampton.}

The collection of Chrysanthemums annually cultivated in the gardens of J. P. Morgan, Esq., is like in mont reapect to some others we have seen in wellappointed private placen. Though none are required for exhibition purposen, the syatem practised is essentially-but not quite-the wame as where the firat prize in a particular competition is the expected finale of all the care and laboar expended on the plant during the gear. Naturally, therefore, when the planta are grouped together in the vinerien or other convenient atructure, they furnish a display quite worthy the visit even of the apecialist, for he will be sure to see good exhibition bloom: of many of the choicer as well as of the latent varieties ; and, moreover, the plants present a better cared-for appearance, by reason of their dwarf character and their retained foliage, than in nometimes the case when the grower's aole object has been to secare flowers for his exbibition atand.
To some minds, perhapm, it may aeem wasteful to grow large blooms at the expense of numeroussmall onea, when the purpose is but to provide material for cutting. We do not think so, but, on the contrary, are of opinion that the beat cultare of ordinary varieties, if the object is to furnish vases in livingrooms with blooms, is to une medium-nized potspots 9 inches in diameter are quite sufficient in mont cases; grow the plants well and fairly strong, and thin the bloom to three, four, five, or aix to each plant, according to the habit of the variety. By auch means excellent bloom are obtained, of good aize and colour, and these are more handsome, and will last very mach longer, and are, therefore, no more expenaive than thin, mall, poorly-developed flowerm. We aid ordinary varieties advisedly, because there are some which we generally style decorative varietien, and there are the aingle-flowered and the Pompon-flowered artw, which are admittedly more effective, when little, if any, thinning is practised.

The collection under notice numbers about 1500 plants, and Mr. J. F. Mc Leod has added almont all the novelties that have proved themelves worthy a place in a collection containing already as many as 367 varieties. It is thought, and reasonably enough, that this number is needlessly large, and Mr. Mcheod intend to weriously reduce it before another seanon. As most of the varieties which have done well here thin meason have been noticed pretty fully in other collection, we wall only mention a few that were conspicuoul a week ago. In the first place, a word in deserved by Golden Gate, a very pretty Japanese flower of coft yellow mooth floreta, and no doubt very good one to cultivate for cutting from; the planta only grow moderately high. Jno. Shrimpton, with unally four blooms on each dwarf aturdy looking plant, is likewise very useful, the habit being so good. Sunflower in not slwaye kind, but here we noticed a namber of good bloomn. Robert Owen, MdUle, T. Rey, Viviand Morel, President Borel, Mrı,
F. Jamenon, G. C. Schwabe, H. L. Sunderbruch. Florence Davis, Emprest and Golden Emprens of India, Golden Beverley, Hairy Wonder, and Jno. Salter were all good. A variety much in Mr. McLeod' favour is Lady Saunders, a tolerably ahortgrowing good habited Japanese, bearing mooth white flowers with warm lemon centre when first opened. Madame Calvat, a moderate-aized Japanese flower with broad forete, and Dake of Wellington, may also be remarked. Anemone-flowered ortsincluded the old Fleur-de-Marie, and the new and excellent Descarter; also La Marguerite, violet-parple; Delaware, white, with pale lemon centre; and Marguerite Solleville, lilac, tipped with shaded white. Liberal and excellent culture is afforded everything that is given a place in this garden, and there will soon be a capital diaplay of early-flowered Cyclament.

\section*{At Mer Stevens', Putney.}

For very many yeara has Mr. Geo. Stevena been growing Chryanthemams at Patney, and during these jears he has raised and introduced not a few sterling varietien. He may have been engaged ia the work thirty seasons, perhap more; certainly, not appreciably fewer. Now, however, his concern chiefly reats in the cultivation of blooms for the market, and for the florist's buaness, repreaented by his shop in the High Street. There can be no quention that Chrysanthemum culture for market was rewarded a fow years eince by much higher prices than can now be realised; trae, the public are buying these in common with almost all kind of flowern more freely now than they have ever done, but parallel with this is the better aupply. \(O f\) late jears, not only have a greater number of growers to be reckoned with, bat many of these cultivate the plants in prodigious and hitherto unheard-of numbert, These large producer are also content with auch a retarn that mut make many of their contemporarien wonder how and by what mean they secure any profit at all. The outcome of all this is, without doabt, a boon to the pablic, who are now able to get cheir "bunch" of Carysanthemums for as few pence as once they paid hillinge. On the other hand, the grower themselves are driven to the atrictent economy in labour and other renpects, and they mutt grow only varietie which by reamon of their adaptability to the production of a quantity of bloom, will furnish a profit at the present market prices. In apite of this, there is little doabt that the 4000 plants which Mr. Steven cultivates give a good account of themselven when the blooms are upon the market, but he is inclined to grow fewer large blooms than formerly, owing to the desire of the buyer to have an large a number as possible for the price he pay.
Among varieties in bloom a week ago in this collection were Florence Percy, white, incladed owing to its diaposition to free flowering. Mdlle. T. Rey, a very uneful nort for supplying a number of better-clan blooms; Wm. Stevent, a variety rained by Mr. Steven some aeven yeara ago, and nimilar to Soarce d'Or, bat of better colour; W. H. Lincoln, than which few varieties are better auited for market sapply; Rabra perfecta, a pretty little crimaon flower; Golden Gem, of which a number of plantw were in bloom; and Mra. C. Orchard, another of the Soarce d'Or class. Boale de Neige is still kept in good quantity for the production of white bloome at a late date, though the flowers are not \(e\) pare as could be wished; and L. Canning is grown largely. As interesting as any, perhapa, was a batch of Niveum, with a number of good blooms apon each plant. It will likely prove very desirable from the market growers' point of view for the aupply of what they term " better-clan blooms." \(P\).

Allanthus Bark.-Mr. David Hooper, is the Pharmacoutioal Journal for October 26, hat an article on the medicinal qualities of the bark of this tree. The bark is intensely bitter, and is used in dymentery and as a vermifuge. It would in all probability be as good an insecticide at quaseia.

\section*{Home Correbpondenoe.}

BPORTING IN POTATOB.-I cannot admit, in response to "D. T. F.'s" aggeation, that I have met with namerous eport is Potato in my time. So far from that being the case, I have very rarely met with a aport: indeed, in my own pertonal experience, never. Mr. Fenn has a striped Potato which he seys aported from the white Rector of Woodatock: and Mr. Chopping, of Sittingbourne, ham a pretty mottled Potato which is asid to have aported from Vicar of Laleham. I know only so much of them. The aportivenens I have chiefly met with in relation to Potatos is their tendency to appear from time to time ander diverae appellations-but Nature hat nothing to do with that, Divervitien come only at the prodact of intercrosning the flowers, bat that is not aporting. If I were told that a white finh Potato had aported to a yellow one, or vice versd, I abould simply laggh at the angeetion. Naturally aceptical, I am not credulous, and always doubt what perwonal observation lead.me to regard as the reverse of fact. A. D.

THE TRUTH ABOUT PRICEs. - My scepticism as to the amount of the prices mentioned in the prize enay is not to be regretted, since it ham produced positive proof that such thing are; but let no general market grower llatter himeelf that he can obtain them. He may atrive to grow his frait well, and insist on his gatherers rejecting all unsound Apples, so that they may not infect his atored heapm. Hi may sort and pack carefully, and allow no unfair trading, to that he will gradually acquire a good character. Then his goods become known and appreciated, and are enquired for and cleared off the alenman's atand, while other aro neglected; bat he certainily will not get double the prices ruling in the market. Mid, Kent.
requlations at the drill.hall meetinas. -It is much eaner to auggent what bould be done to secure absolate snonymity for product of any description sent or brought for consideration by the committee at the Drill-Hall meetings, than to earry them out. No doubt all that "Vivitor saggeats could be done, but, all the ame, in the majority of caesen it would be known whoee exhibite were presented. It is so difficult for myone to take produce to the Hall and atage it without being seen and noticed by membern of the committeen. Still farther, it is very possible for many members to tell intuitively from whom thinge come. If anonymity cannot be absolutely secured, what use is it to attempt eocaring it at all. But again, what harm in done if it be known to whom the reapective products belong? It would be a matter of surprise to learn that sach knowledge made any material difference to the awards. I can speak for the Fruit Committee, at least, and say that it treats everybody, membera or non-members, known or unknown perton, alike; merit in the products alone secures award. It mast be anderatood that in entering for the respective committees' award, there is no competition. At ordinary exhibitiona, auch eecresy as to exhibitora may be desirable ; although I think few men would, as judges, be influeaced by pertonal knowledge of the competitort. In any case, I do not think any evil reandes at the committeen from the prement aytem. If there be aay, I have not seen it. \(A\). D.

ANONA CHERIMOLIA. - Amongst the Kew notes in laet week' inue of the Gardewers' Chromiche, mention is made of the succenaful treatment of this plant. When living at Warwick a friend gave me a plant of it, thinkiag I might be able to fruit it. I kept it in an intermediate-house, and gave it apecial attention, but without nuccem. I have an idea that if it was treated as Peaches are in a Pesch-house (a) your correspondent recommends), good resulte would be obtained. I thould like to know what age tho plant now fruiting at Kow is, and what it the ajze of the pot that it is in. Geo. Burrooos, Berwiok, Shrecosbury.

LILIUM AURATUM AT BRICKLEHAMPTON HALL GARDENB.-A bulb of the above Lilium wat parchased in the early apring from Mearrs. Sutton \& Sone, of Reading, and potted in an ordinary compost, used for the generality of greenhouse plante here. It was kept in a cold frame uatil it warted into growth, when it was tarned out-of-doors, and planged up to the rim of the pot in coal-amen. Daring the summer it was attended to regularly with water; when the pot was filled with roota, we gave it weak manure-water occationally. At 1000
as the buda began to appear, and the firat flower ready to expand, it wam removed into the conservatory, where it remained until the blooming period was over. On August 12 it contained thirty-two expanded flowers, and one bud unopened, when the photograph wes taken in the conservatory. The thirty-third flower opened ahortly after, and before any of the othera began to fade. It was a grand sight ; the grateful odour exhaled filled the house with most delightful perfume, and it was the admi yation of all vieitore during the time it wa in flower Edward Lott, Bricklehampton Hall Gardens.

TODEA SUPERBA.-A magnificent apecimen or the above was noted last week at Brinkburn, Dar lington, the seat of H. F. Pease, Esq. 'The plant measures from tip to tip over \(6 \frac{1}{3}\) feet, and at the present time it is carrying five years' growth, and the fronds are of the most intense dark-green colour, feature which diatinguishes healthy plants of this pecies. I was informed by Mr. Wand, the gardener that the plant is twenty-seven yeark old. So fine a plant indicates verv careful attention during a long period of time. The house is unheated, and the temperature in it last winter was as low as \(12^{\circ}\), or \(20^{\circ}\) of frost. In the ame house is a grand mase of the Killarney Fern (Trichomanes radicans) in a 24 -inch pan measuring over 5 feet across. J. C.
the crab for flowering and fruiting I am very glad to see Mr. Harrison Weir and others trying to bring the Crab an prominently before the readers of tha Gardeners' Chronicle I quite concar with "D. T. F." that many of our shrabberies are too mach filled with evergreen shrabs, which are very good in their way, bat when nothing elee is planted our gardens and landscapes are apt to become tomewhat monotonons. A judicious mingling of deciduous trees and ahrubs would have an entirely diffarent and more agreeable effect. Crabs being both uaeful as regarda their fruit and ornamental, sither in frait or flower, should be more commonly planted in the shrabbery than is now the case, and also at ths margins of ornamental plantations, where they would show out well in contrat with the more nombre hues of other trees. Bat why ahould we not plant a numbar of the strongest and hardient of one Apples, auch as atandards, amongat the shrubbary and ornamental borders, for nothing looks batter in the spring, nor could there be anythiag more urefal in autumn. I have seen Apple-blossom greatly in demand for decorative purposes when it could be had. Bat no one would care mach about cutting blossom from a tree they expected frait from; bat, on the other hand, if there was a number o Crabs and Apples planted amongst the shrabs and odd corners, the blossom could bs taken without fear of in any way cartailing the sapply of fruit in the garden. I once planted a large shrubbery with groandwork of the common Liarel and Rhododendrons, dotting it over with standard trees of th Apple, Crab, Crapægus, Almond, Pranus, and Liburnum, and the effect was exceedingly fine. D. \(L, M\).

CEDRUS LIBANI BLOOMINQ OUT OF BEABON. A ccording to my exprrience, the Cedar of L:banon blooms in May and June. I was therefore arprised to see, about the middle of last month, a tree of middle sizt growing in Tooting Graveney, the brancher of which were laden with a great number of it jellow flowera. Are Cedars generally blooming at this unumal senson about the country, or is the above an exceptional occurrance? William Earley.

DIPLADENIA AMABILIB.-When well done this apecies ranks amonget the moat showy and unefal Gtove climbers we ponseas. When at Chevering Park Gardens, Sevenosks, a few days ago, I foand the roof of the atove adorned with this plant and the beartiful Dipladenia bolivienuia, and a grand specimen of Allamanda Hendersoni, all of them flowering profasely, enpecially the Dipladenia amabilis. This plant is growing in a 20 -inch pot, and coveras roofpace of 21 feet by 6 feet. It has had apwarde of 150 racemes of flowers, the strongent of which bears no fewer than from thirty to forty blooms, it being a wonderful example of good caltivation, and one which naturally enough attracted my attention. Allround gardening is done well at Cheverivg Park, Mr. C. Satectogreat credit upon the head gardenor Mr. C. Satton. 4. 0.

THE ROYAL HORTICULTURAL gOOIETY AND OHIAWICK OAADENB. - No doubt when Mr. Barron formally retire from the management of Chiswick new arrangements will be made in connection with
the management of the gardens, but that nuch arrangements matt necessarily be improvementa is open to question; at the same time, it is to be hoped that some atep may be taken in order to render the Royal Horticultaral Society and it doinga more truly national. The importance of horticultare, abd especially commercial horticulture, is daily becoming more apparent ; and the aim of the Royal Horticul taral Society in the future should be to fonter horti culture as a national industry. The Society ihould encourage, by all means in its power, all efforts made to improve caltare, to increase and improve varieties and to extend the use of fruita and vegetables as ementials of daily national life and health, and also the free use of plants and flowers asimportant factors in the anm of human happiness. There can be no doub the frait, the pablic in a freah and proper way, constitute an important element in the production of a contented and healthy atate of national life. Amateur horticalture should, of course, be encouraged by all the means at the diaponal of the Royal Horticultural Society, but at the ame time much prominence should be given to the importance of commercial horticultare. In these times of enormous foreign imports of fraits, flowers, and vegetabley, not tn mention egge, poultry, and butter, it becomes us as a nation to seriously conaider whether or not we can compete more thoroughly with the foreigner. Preferential railway rates in favour of the foreigner exist at the present, but is it too mach to hope that a time is coming when this will not be the case? Is it too mach to hope that British agricultuiste will rise to the occasion, and go in for producing more of those articles that are always in demand: And is it too mach to hope that the Royal Horticultaral Society will become alive to the importance of foatering, by all means in its power, the important induatry of British horticalture. in sll its branchen? The immense importance of fresh, well-grown fruits and vegetablea is daily becoming more evident to the people generally. A better general atate of health can be maintained by the jadicious use of fresh fruits and vegetables than by any amount of mediciner. The sooner this comes to be universally acknowledged the batter for our people and if the Royal Horticultaral Society wil people, and make it itn endeavour to epread abroad the glad tiding of peace and good health to men and women through the extended ase of fruits and vegetables in a proper condition, the Society will have done much to earn the national gratitude and to desorve nationa nupport. John Thomson, Clovenfords, N.B., Nov. 13.

Thank you for your leader on Chiswick It is aid that history repent itself, bat another Lindley is not likely to appear there, I should say I think it is time the Royal Horticultural Society Council gave the Fellows eme notion of their pro posed new movement. Oae thing is pretty clear there will be no peace and progress till the governing body pate itself more fally in touch with gardeners generally. As it is, the Royal Horticaltural Sociaty is simply a trado society-it scarcely toucke the amateara or gardeners of England beyond a radina of 30 miles of London. My idea is, that such society ahould have branchea or agencies in all large centres of the British iales, and especially it ahould bind all bona fide gardenern into a nationa society, or union, or gaild, call it whatever you will. Pottering about in London, giving medals to nurserymen, and helping them to advertise their goods, is all very well in its way, ao is the carrying on o trials for the trade at Chiswick; bat there is a higher and wider field untouched. We want anion, we want science, we want progrens and extenaion and if country gardenere will not come to the aociety in London the Society must go to them. F. R. H. \& [An elaborate acheme for the institution of local secretaries and branch eccietie was formalated at the time of the exodan from Kensington, but nothing has been heard of it since. Perhap the failare of the last provincial show at Liverpool diacouraged further efforts in that direction. It was certainly worthy of a better fate. ED.]

A FREAK OF NATURE. - The production of a green pitcher on Nepenthen Cartiaii in these gardens is an occurrence worth commemorating. The plant, a amall one, carries only six normal pitchers, besides the green one. Thic freak may not be uncommon, although no similar cate has hitherto come ander my notice. By stopping the shoot immadiately above the leaf which possenses the green pitcher, and thus cause ashoot to break from ite axil, it in possible that a sport may be secured. Thon, Coomber, The Hewdre, Nownowth.

\section*{SOCIETIES.}

\section*{ROYAL HORTICULTURAL.}

\section*{Scientific Committee.}

November 12.-Present: Dr. M. T. Mastert (in the chair); Mr. McLachlan, Mr. Michael, Rev W. Wilks, Dr. Bonavia, and Rev. G. Henslow, Hon. Sec.
Death of Prof. Riley.-Mr. McLachlan spoke of the gree oss sustained by the death of this eminent entomologita of the Museun of Natural History, Washington. Ho wa the State Entomolugist of the Agricultural Departmenk, formerly for that of Missouri
Hybrid Asters.-With reference to the specimors wat of the last meeting by Rev. C. W. Dod, Mr. Dewar reports as follows:-"Although not quite prepared to agree with him fully, neither am I disposed to materially difer from his suy positions. 'The chief difference was one of colour; the flower of the supposed hybrids are undoubtedly somewhat larger than I have before seen; the colour, however, is quito
distinct from that of typical A. Thomsoni. The ceos distinct from that of typical A. Thomsoni. The crow
between A. Thomsoni and A. Pyrenæus (?) is in every respect, except its large flowers, typical A. Thomsoni The other cross (?) differs little except in colour of flower from seedlings. A. Thomsoni is a very
variable species, becoming of course considerably more so by cultivation." Mr. Dod having kindly forwarded more so by cultivation." Mr. Dod having kindly forwarded fruiting specimens of A. Thomsoni (Clarke) and of the hybrid The leaves solected from simi'ar places were much larger and broader in the former, with mure serratures; the hair out the stem were shorter, but the involucral bracts were lew hairy, the tips being nearly glabrous. The pappus wa markedly ihorter thall that of the hybrid; a few bore ripe achencs. In the hybrid several of the ray florets were bisexual with perfectly free stamens, the anthers being more less rudimeutary; a few of the ray corollas were of the quilled form. Ali the ovaries, disk and ray, were abortiva The above characters might be varietal only, but the presence of stamens, sce, perlaps indicate the efiect of crussing.
Fungus on Pears.- With reference to the specimens receivel from Messrs. Veitch of Exeter, at the last meeting, the fol lowing report was received from Kew:-" The fungus on the Pear is Mouilia fructigena, Pers. The individual patches of fungus are limited in extent; the first formed exhausts the necessary food for a limited distance beyond its fruiting area Its sporen germinate and grow just beyond this sterile zone, hence succeeding cropis are more or less concentric, and hence succeeding crops are more or less concentin, thei separated by narrow ster
thus resemble Fairy-rings.

Cocos anstralis.-Dr. Masters exhibited orange-colour Plum-like fruit received from Antibes, and sent by \(Y\) Naudin, and also by Mr. Hanbury from Lia Mortola. Itis native of Paritguay and Chili. It was the first occasion of a Pine Apple
Cypripelium, Hybrid.-Mr. Veitch sent plants of C. Minosh (male) and Cors of the parents-viz, C. \(\times\) Arthurisinual (male) and C. spicenitnum (female). The furmer is the reo a cross between C. finsigne \(\times\) C. Fairieanim. Two sping from the sarne pod showed considerable "dissociatia, the in that one mure resembled the male, and the other the emale; but the peculiar purple and white stuminode of the nale was lust, the green one of the female parent bein present in both. The spotted perianth of the male was very pronounced in one, while the white sepal of the female wo the female appeared on both.
Rhodulemdron, Hybrid.-Mr. Veitch also sent a now form Hhodnchulron, Hybrid.-Mr. Veitch also sent nowne, indico-javanievied
multiculor var. Curtisi. Indico-javinicum resultiod from crossing Lord Wolseley (a bybrid containing the than true species, K . jasminiflorum, K . javanicum (twice), R. Broukianum var. gracilo) with Azslea indiva, "Stella. This pruduced rather contracted flowers of a brick rod culour.* This was crossed with the small crimson.flowerem ( 1 inch) R multicolor var Curtisi, Numa bears large flown 2 inches) of a deep red orange, with a shorter tube than tha of the female parent. Hence the effect of the male in of the female parent. Hence the effect of the manale, the transmit the form of the corolla; but that of the Iarger an colour as well as the foliage, which is lanceolate,
broader than the leaf of \(\mathbf{R}\). multicolor var. Curtisi. Bluch-skinned Apple.-Dr. Masters exhibited an Apple, the rind of which was of it deep purplish black colour, the collume tissue within being light brown, apparently due to fermad tation. It was forwarded to Kew. Mr. Michael remarkilar that he had known Blowheim Orangee to assume a simili appearance.
lies, Dead, adhering to Barley.-Mr. Henalow exhibitods specimen propared by the late Professor J. S. Henslow, 1840, of fies attacked by a fungus, and which had died further ears of Barley.
investigation.

\section*{KINGSTON CHRYSANTHEMOM.}

November 12, 13.-Held, an unual, in the rooul but very cold Drill Hall, and, for the time of you in fair weather auapices, the Kingaton Society in

Tigured and \$loscribed in. Journ B.EIS, rol xilily \(p^{\text {t }}\) p. \(23(1821)\)
bo congratulated on having a capital show. In aome features, perhaps, notably in the popular Challenge Vase class, there was a falling off in the competitions, but in the fruit clasee a great advance. The achedule inclades so many classes, nambers of which are merely local, that we present results only in those of wider intereat.
Plants. - The miscollaneous groups were relieved from their umal dulness here by a very light graooful arrangement set up by Mr. Ridge, gro. to EWIMFEX EıDY, Req., Q.C., Weybridge, who was a good lit. Mr. F. Hopkiag, Er. to Mrs. Wodderspon, Walton, was 2 ad ; and Mr. Tekell, gr, to B. F. S. MCGMACE, Keq., Kingston, 3rd.

Chrysanthemum groups were of the vaual very wolld order, simply plants and flowers orowded into a semicircular mases. Mr. French, gr. to Mre. Barclar, Wimbledon, was lat, having the best front; Mr. G. H. Hage, gro to Karl Dysart, Ham Houes, coming 2nd, having the freshest blooms, but bid front; Mr. Porbes, gr. to D. Nictiol, Eeq.o Surbiton, came 3rd.

Trained Plants.-Siz very fine apecimens, suparbly bloomed, ware shown by Mr. Swan, gr. to MUrray Smita, Esq., Weybridge, who had Florence Davis, W. Tricker, Mrs: Stevens, Ping Chriatine, Mra. Dixon, and Mra. G. Ruvdle. Mr. Pend, gr. to R. S. Bond. Req. Surbiton, was 2nd. Mr. Swar also gr. the beat three trained plants. The best three standard esme from Mr. King, gr. to A. F. Perkins, Eqq., Holmwood, who had good apecimens of Viviand Morel, Pink Christine, and Chinaman. Mr. Swas wee again lit with four trained Pompons, having Black Douglas, Bose Margaret. W. Wentlakp, and Marguerite St. Coo; Mr. J. Plowman, gro to C. LATERS SMITH, Kaq, Long Dition, was 2ad, with better flowered plants; Mr. Pead came 3nd.
Cut Blooms. - Only four growers compoted for the seventh grand Challenge Vase this time. The competition comprised twentr-four Japsnese and twenty-four incurved flowers. Lest year the Cup was won by Mr. Higgs, gr. to J. B. Hankey, Esq., Fetcham Park, Leatherhead, who takes the 1st place this time, and thus in two years wins the trophy outright. He had fine incurved, the varietioe as they ran from back to front being L. Lambert, Lord Wolseley, Joanne d'arc, W. Tunnington, Princem of Walon, Violet Tomlin, Lord Alcester, C. B. Whitnall, Lord Rosebery, Mrs. R. C. Kington, and othera of recognised merit. Of Japanoes, the best were Mdlle. Thérese Rey, Charles Davis, Mons. Panckoucke, Deuil i'e Jales Farry, Sudflowar, Viviand Morel, Cal, O. B. Saith, M. Marie Hoato, W. M. Soward, and other popular varietien. Mr. Hunt, Rr. to P. Rachi, Req.a Ashatoad Parly, Was Violet Rose, Sunflower, Col. Chase, Madame Marie Horte, V. Morel, to : Mr. Nerille, gr. to Y. W. Fleart, Erq, came 3rd, his stand including a Rcod Madame Carnot ; Mr.
Q iarterman, gr. to C. E. Smith, Esq., Cobham, was 4th. Q ae executive will now havo to provide a new Vase for next year.

Incuroed B'ooms. - In the class for twenty-foup, Mr, Meses, gr . to A. TATE, Esq., Leatherhead, Whs a good let, having fine
Howera of Lord Alcester, Maj)r Bonnajon (selectod as the pre mier incurved in the show), J. Lambert, C. H. Curtis, Rmpress of Iadia, Lord Rosebery. J. Doughty, Golden Empress, Jeanne d'Arc. Princess of Wales, Globe d'Of, \&c. Mr. Higas was 2nd, with very fair flowers. In the class for twelve blooms. Mr. King was let with fine flowers; Mr, Ridge coming 2nd; and Mr. Coombes, gr. to W. FUrse, Esq, Teddington, 3rd. In the class for air bloma, Mr. Quarterman was lut, haring good Qaeen of England, Lord Alcester, John Lambert. Kmprew of
India, Violet Tomin, and Mies M. A. Haggas. Mr. Mirciax, India, Violet Tomlin, an
Leatherhead, was 2nd.
In the class for six blooms of any variety, Mr. Higes was lat with Larga, bat rather rough, Empress of India: Mr. Felgate, gr. ts the Duchess of Welungton, Walton, having Violet Tomlin, 2nd; and Mr. King was 3rd with Robart Petfield.

Japanese flowars ware very plentifal, the bent twenty-fout coming from Mr. Mense, who had very good Viviand Morel, Mr, Owen, Silver King, Good Gracious, W. G. Newett, Golden Gate, Charles Davis, Mrs. W. H. Leen, Dulke of York, de. Mr. G. Elliott, gr. to P. W. Grafick, Req., West Molesey, was 2nd, having some very fine flowers. Mr, Standing, gr, to Mr. Goad, Worthing, was 3nd.

Mr. King had the best twelve Japanese, including fice Viviand Morel, Sunflower, Lord Brooke, Louise, Mdlle. The è se Rey. Vicoouatess Hambledon, tc. Mr. Coombrs was 2nd, and Mr. Holden, gr. to C. W. Izod, Eqq., Eoher, 3rd.
being 20d. In the clas for ir Japanens of Quirtermax being 2ad. In the clans for ix Japanese of one rariety, Mr. Kiwg was lat, with fairly good Mdlle. Thérèse Rey: fine Golden Gate and Madame Carnot (the premier Japanese bloom) from Mr. C. HUNT, who was 2nd; and the first-named from Mr. Higgs, 3rd.

Other Sections.-Mr. Mesese was egain to the front with the best twelve reflezed, having the ususl varieties.
Jap inese Anemones were very good indeed, the beyt twelve coming from Mr. Turner, gr. to O. F. MuRrar. Req., Epsom, Who had Sir W. Raleigh, John Bunyan, Enterprise, W. W. Astor, Madame Julea Benedict, \&c., very fine. Mr. C. J. Waito, gr. to the Hom, Col. T^Lbot, Ebery, Was 2nd; and Mr. Spriagthorpe, gr. to A. A. Beavas, Esq., 3nd.

Mr. J. Plowman had the best 'Anemone Pompons, and the bent twelve Pompons in trebles. With three variotios of the Hundle family, six blooms of each, Mr. Read was lat.
Singles were very fine indeed, and beautiful. The beat box Of twelve varieties came from Mr. Forbes, whu had Adeiral Meymour, Charmiag, Rose Pink, Purity, Mary Anderion, \&ec.:

Mr. Micheim had the beat six table plants; and Mr. Port-
bury, gr. to W. N. FROYD, Eeq., Putaey, the beat nine plant it whilst the best six Bouvandian came from Mr. PEad.
Mr. Erence had in well-fruited, long red Capaicums, the best berried planta; and Mr. Mirliay the bent six double Primulas.

FRuIt.
These Exhibite were plentiful and good. The beat four dishes of various kiads from \(\mathrm{Mr}_{\mathrm{v}} \mathbf{W}\). Davies, gr. to J. B. CHappell, Keq, Toddington, who had Alicante Grapee, amall Piat, Cos's Orage Applet, and Beurré Diol Pears; Mr. G. H. SiGE was 2ni.

Black Grapes were in flae form, the beat, pretty, well-finibhed Alicante coming from Mr. G. Ellott: Mr. J. Burr. Byfleet, coming 2nd, with other good Alicantes.
The best whites, all bela, Muscat of Alexindria, were from Mr. Taylop, gr. to 8. Bayren Eeq., Forest Hili: Mr. Cole, Mr. Taylof, gr. to 8.
There were fifteen lots of dix dinhes of Apples, Mr. Wics Taycka, Hampton, comidg lst. with beatiful examples of Cora Orange, Riboton, and Kiag of the Pippins. Emparur Alexander, Annie Elizabelh, and Blenheim Pippin; Mr. Tubb, gr. to B. Ourrie, Eeq.o Frimley Manor, Faraborough, was znd The best four dishes of Pears, came from Mr. Daviles. He hed good Doyenné du Comice, Glou Morceau, Beurfé Boec, and Beurré Diel.
Mr. C. J. W Artw had the beat baket of vegetables.
A nice collection of fruit was shown by Mr. Wilt Tayker and Mesars. Tuttock and Sheprerrd, exhbited a capital dish of Bórioart de Thury 8trawberries from the open ground quite ripe.

\section*{FARNEAM, SURREX.}

November 12.-This exhibition was held in the Corn Exchange and the Assembly Rooms, each of which was well filled, whilst by judiciously engaging two rooms there was no overcrowding in any section of the show.
Groupa were a feature. Mr. Cresswell, kr. to Miss Kkwiedy, Aldershot Park, wain denervedly lat, both from point of quality and arrangement. Mr. Gaymer, gr. to Mra. Anderson, Waverley Abbey, Farnham, wan a good 2nd, In another group clam for trade-groweri only, Mr, Mortimer, Bwins Nurnery, Rowledge, was an excellent lst with plants not so severely disbudded, each plant bearing several fine flowers, with buds also showing colour Mr. B. Bude, Alma Nureery, Farnham, who wai 2nd, had done even less thinning, this group being very bright and showy
Spec
miscellaneous ond Farmham, was both bright and good.
The Challenge Clase for cut blooms was won by Mr. Garuer; this being the thind time he has won tho Cup, It now becomes his property. Very Ine blooms were noticed in both sections, the best of the Japanese were those of Fairy Wonder, Madame Therese Res, Mr. W. H. Lees. Of incurved, Wonder, Madame Thérese Rer, Mr. W. H. Loes. Of incurved,
Empress of In lia, Miss Haggas and Princess of Wales. Empress of India, Miss Haggas and Princess of Wales.
Mr. Fry, gr. to Sir W. Rose, Moor Park, Farnham, was a capital 2nd. In another class, also twonty-four Japanese and twelve incurved, these same two exhibitors occupieci similar positions.
The best aix blooms of one variety of Japaneme were those of Viviaud Morel, shown by Messrs. Doriay \& Son: Mr, Osmax, Ottershaw Park, Chertsey, having six good blooms of Jeanne d'Are in the Incurved class.
The best Grapes were of Blacks, Alicante, shown by Mr Mortimer; and of Whiten, Muscats, by Mr. Osman. The best vegetables in two clasacs came from Mr. Powney, gr. to Colonel Fitzrov, Hale Place, Faraham, twelve
varieties in each case being required. The best if dithos varieties in each case being required. The best fix dishes of dessert Apples wereshown by Mr. Prewell, gr. to T. J. WoonRorye, Kiaq., Fransham; and the best nix culinary by Mr. Turner, gr. to R. H. Conmas, Eaq, both exhibito being good.

\section*{LIVERPOOL.}

November 12, 13.-The autumn exhibition of this Society was held in the St. George's Hall, and was very satisfactory. The quality of the cut blooms of Chrysanthemums was better than has been the case during the last few years. Fruit, usually good at Liverpool, was excellent. The arrangements were very good under the direction of Mr. Dickson, the Secretary. Cut blooms receive most encouragement, and they were staged in large quantity.
The principal prize was that for forty-eight blooms, to be composed equally of incurved and Japanese varietien. There were meven competitons: the lit prize being somewhat easily won by Mr. J. Jellicoe, gr. to F. Gossaoe, Eaq., Camp Hill, Woolton, with blooms possessing much mealt.
The incurved wero particularly fine and well staged, and includad Lord Alcester, Emily Dale, Queen of England, Beauty, Princen of Wales, and Lucy Kendall. Mr. G. Eaton, RT. to W. H. Surresy, Eeq., Allerton House, Was 2nd.
For eighteen Incurved blorman, Mr. J. Henton, gr. to R. P. Hoviton, Esq., M.P., Nursery Roed, Aigburth, won with excellent blooms, including leading varieties. Japanose blooms in eighteen varietles were dintinctly merituriuus, 80 well were they ataged. Mr. J. Heatom agrain won the pre.

William, gr. to J. Procroz, Enq., was ind. Mr. C. Sherlock, gr. to E. Edmompeon, Eeq., Woodlands, A igburth, won the premier ponition for tweive Japanese in a brisk competition. Anemoneflowerod varietien were bent mown by Mr. G. Eiton, in the clana for uix blooms, the centre, or diec, being thoroughly well doveloped. A like remark applios to the retered variotion, aleo ataged by Mr. Eatom.
The class for exbibitort who hare not prevlounly wod a price at thin ahow was an extromely grod one. Mr. J. lucurved, and the same mamber of Japarisese interas.
Japane blooma ataged with long stems for effoct wero well shown by Mr. B. Cromwoll, gr, to F. Butrom Timmia, Enq., Cleveloy, Allorton, who was let. He had guod bluoman diuglayed on an oxtru eired alo ing thand.

\section*{Planta}

Planta wore contributed in large numbern. For three trulnod specimens, Mr. T. Goman, gr. to J. A. Bants.ert, Erq., Lyyton. Momiloy Rili, Liverpool, wan lat with plant Prooly flowered and not two etifly trufnod. For one untrained
 lace, Boltonmoor, won.
The bont group of Chrysamthemunan was from Mr. J liracegirdle, gr. to W. H. Watcm, Emq., Elm Hall, Wavertree The plante were dwarf and carried good bloom, sor were they too closely packed.

Orchids made a plessing display.
Froit, ace
Fruit formed a remarkable feature. For alx dishen Mr Crowwell wecured the promier award with capital Grapes, Muscat of Alexandria and \(\Delta\) licante, Marie Lonise Pears, Molon, and a dith of Ribston Pipple Applen. Mr, R Hrnagan, gr. to T. Comern, Eeq., Saighton, Cbouter, won for six dishes of Peare, and for a like number of Applen. Mr. J. Davien, gr, to W. E. Kive Kivo, Esq., Bodenham Manor, Leominster, was an eany Ist with besutifully-coloured examples. Exhibtt of Grapes were numerous and good. For four bunches, dintinct, Mr T. Elsworthy, gr. to A. R. Giadsionk, Eeq., Court Hey
 Alicante, Alnwick Soedling, Golden Queen, and Muncut Alexandria
Mearr. P. P. Kerr a soms ataged a remarkably fine lot Orchias in variety

\section*{THE WEST OF ENGLAND CERYSAN THEMOM}

November 12, 13. - The annual exhibition of the above Society took place on Tuesilay and Wednesday, at the Plymouth Guildhall, and in every way the show was a great success. This year, by a better system of gronping and arrangement, the whole of the exhibits are placed in the hall, and the result has been a finer effect, and it gave much greater pleasure in viewing the show as a whole.

\section*{Cut Breons.}

The entrien in the majority of the classen were numerona. and as a consequence the competition wan very keen, By, murch mo that in several instances it was but hy a matter of a fes points only that the winners secured their coveted positions. In the class for Horticultural socioties within the four counties of Deron, Somerset, Dorset and Comwall, the class being for thirty six heoms, to consist of twenty fons Japanese and twelve incurved, the Teigmmouth Horticul. tural Socety was awarded 1st, the 2nd falling to that from Newton-Abbot. The clans for forty-efght Japaneas, not fewer than twenty-four varieties, was a very atrong one, the flowers all through being exceptionally fine. The premie position was ultimately awarded to J. B. Fortzacue, Eeq. Boconnor, Cornwall (kr.. Mr. (. Page). Here we noticed
Mrs. J. Denne, G. C. Schwabe, E.. Molyneux, Vicletta, and Col. Cbase amonggt the hest. H. Hammomd Spericer, Esq. Teignmonth (gr., Mr. G. Foster), was 2nd, Laving, amongst others, Midame Carnot, Mrs. \(\because\). M. layne, and Hickar Dean, very fine. W. Herbert Fowler, Tauntion (gro, Mr. G Hawkins) was third; his sliver King, Viscounteas Hamble don, I.. E. Saunders were especially fine in a very goo display
For twenty-four incurved blooms, H. Haxmord Spencer was 1st, C. G. Pridelex Brune, 2ad. The facurved bloom were mostly neat, pretty flowers; but every seaecu, classe for those seem to suffer in sire, through the greatar wive of the loading Japanene flowern.
For aix Japanose white, W. Haberat Fownea, was well lut with grand bloonis of Medame Ad. Cbaton ; and R. HanMown Spencke 2nd with Madame Carnot.
For ifx Japanese, any colour but white, J. B. Fontencue, Esoq., wan lat with M. Panckoucke ; and Mise Faipp, 2nd With Duchess of Wellington.
Twelve Japaneee, T. Wrikivsor was 1et, beating numerous competitors ; and W. H. Veale, 2nd
The clas for twonty-four blooms Japanese and incurve was well Alled, but the immense size of the former kinds, placed in close proximity to the smaller incurved varietles, momewhat detracts from the interest of this class. Sir Jancs Jenerks, Mannamead, wae let, whilst G. Hawres, and H. Endicott, gr.
2nd and 3 rd .
Several classes of cut hlooms were set apart for amsteurs

CHEER and other
warde falling to J. Newton, F. M. Bardson and Georan Hoskin.
G. Foster was awarded 1st in a special class where the prizes were offered by Mr. W. J. Godfrey, of varieties sen out in England during 18

\section*{Groups}

A number of these were arranged round the Hall, and in the principal class fillin' a space of 100 square feet, Mr. C. Warts, Plymouth, was 1st, with a fine display, the quality gond, and arrangement and general effect rnost pleasing some Crotons, Bamboos, Eulalias and Ferns were used with discrimination and advantage. Mr. Chelwill deserved praise for his arrangement; and W. B. Greenslade, gr. to A. Gronv bridee, was placed 2nd.
Other groups confined to residents within 15 miles and Mr.W. B. Gremnslade, 2nd. Primulas were shown by Dr. Square, who was 1st, and Sir Jampe Jenkins, 2nd whilst for some doubie Primulas,

\section*{Misceltaneous}

Some nice Orchids were shown, including fine varieties of Cattleys labiata, Cymbidiums, Cypripedinms, Dendrobium Phalænopsis, \&c., the lst prize falling to Dr. Aldous, Mannamead; 2nd to F. H. Hodoes
Some fine collections of Apples and Pears were staged by Miss Fripp, 1st; and Mr. F. Bradshaw. 2nd. Grape were only represented in one class, Mr. G. Chambe
Ivrbridge, 1st; Mr. C. Norrington, Abbotsfield, 3rd.
Prizes for vegetables were offered by Mr. W. J. Gonfrey and Jarman \& Co., Chard, the 1st prize in both classes being secured by Mr. F. Bradshaw; Mr. G. Watts being success ful with Mr. Lethbridge prize, and Lady Walfer securing that offered by Messrs. Sutton \& Co., Reading. Messrs. A. T. Westlake, Plymouth, J. Lethbridge, W. Thom, Sout View Nurseries, Compton, Messrs. Jarman \& Co., Chard, and Messrs. Veitch \& Son, Exeter, staged groups not for compe tition, the latter having many choice Orchids, amongst them being a number of plants of Cypripedium Charlesworthii, and good forms of Cattleya labiata. Mr. W. J. Godfrey had a fine stand of new and choice Chrysanthemums, as well also as a pretty disp'ay of Camations, including the new ones recently sent out by him.

\section*{DEVON AND EXETER GARDENERS' ASSOCLATION.}

November 13.-At the meeting held on Wednesday, presided over by Mr. P. C. M. Veitch, and well attended by the members of the associa tion, the Rev. Dr. Dangar (Principal of the Diocesan Training College at Exeter), gave a lecture on "Carnations," and their propagation and cultivation.
In the course of his remarks he said, with regard to the mode of propagation, three methods at onre presented themselves -(1) by seeds, (2) by cuttings, (3) by layers. As to raising from seed, this at once ruised the question as to what seed one meant to sow. In England it wats difficult to raise seed at all from double flowers. In some few especially favourable seasons this could be done, but the large growers on the Continent had the best chance by reason of their long sum mers. To attempt to raise Caraation seed under glass generally ended in failure. They needed out-of-door treatment. But given the seed, they shonld sow in a conl frame early in feb-
ruary in a box containing crocks in the bottom, a layer of well-rotted turf, and on the top a compost of loam, seasand, and dung finely sifted. One should sow in rows, water after sowing, and place in a cool frame, quite at the top and near the glass. Much sun-warmth was required, and plentry of air. His plan described above gave both. The moment that weeds appeared they should be pulled up. In May, or early in June, the plants would be quite large enough to handle, and to be potted into 3 or 4 -mnch pots, and placed back in the same frame. There they should remain until the pots were nearly, but not quite, full of roots. It was best to plunge the pots in ashes-(a) to draw the warmth and (b) to keep out worms, slugs, \&cc. In September, or possibly earlier, but in a rainy time, plant out, and in the following July the plants would bloom. hey could not force nature; if they sowed the seed in autumn, as soon as it was ripe the plants would come up, but they will not, as a rule, get a flower worth looking at until the following July year. Some people said it was a mistake to increase Carnations by cuttings. That was not his experience. He took his cuttings at the end of the first week of summer rain, so as to get some growth in the grass. If potted singly in four-inch pots, with the same compost as had been detailed above, and if well pressed down into the soil, a very large percent age would strike. They should be placed in a cool frame, previovsly well lime-washed, and rendered free from insects, and the suttings whould be kept just damp. Most of them would strike in two or three months, but some might remain dormant until the was the Layering, known to all Carnation growers, was the one ustally edopted, but the lecturer said he very light land, wherethactory as cuttings, eapecially in very light land, where the damp was so apt to run ont of the eurface soil, nor in land infented by slugs or other depredators. They wore an fond of the soft tissues of Carnations. As to planting out, toto blooming quarters.
growers would have noticed how constantly it happened that beds of Carnations on the flat, where over-much water was provided on a clay soil, did badly, whereas those on a bank did well. In a very hard winter whole beds on a slope had escaped when those on the level had perished. A beautifnl flowers.

\section*{CARDIFF CHRYSANTHEMOM}

November 13, 14. -The ninth exhibition of this ociety was held on the above dates in the Park Hall, Cardiff. The show of Chrysanthemum blooms was more than usually good, particularly the Japanese varieties, and the competition in many of the classes was very keen. The groups were excel ent, and devices, bouquets, \&c., of the florists' art, remarkably tasteful; making, as is always the case at Cardiff, a fine feature of the exhibition.
Messirs. Peelpg \& Co. and Case Brothers, both of Cardiff, had fine large displays in this way, and were suitably awarded a silver Medal. Mr. W. J. Gopfrfy Exmouth, and Messirs. Clibran \& Sor, Altrincham, each exhibited several stands of cut blooms of Chrysanthemums, many of them being extra good novelties, Aron special award; as also Messrs. Clibravis Lord Lisburne, a good Japanese of terra-cotta colour, and Messrs. CuTbusm and Sons' Mrs. Blick. In the fruit clasbes Apples were well hown. Mr. J Watking and Messrs, Cranston had colle tions similar to those shown by them at Hereford last week Amongst Mr. Watkins' dishes a new kitchen or desse variety, nemed: Lady Emily, Was conspicuous. It is of heavy cropper. He also had Byford Wonder in splendid cundition.

For Twenty-four Japanese distinct.-1st, Mr. G. W. Drak F Catharp-terrace, Caidiff, with grand blooms of Madame Car not, Mrs. H. Payne, W. G. Lincoln, Robert Owen, Madame A. Molin, \&c. 2nd., R. A. Bowring, Esq. (gr., Mr. H. A.Joy), whose best blooms were, Madame Carnot, Etoile de Lyon, Chas. Davis, Viscountess Hambledon, and Lnrd Brooke
Tisenty-four Incurved Varieties, distinet.-1st., Earl of Lisburne, Cross Wood Park (gr., Mr. Williams), with wellfinished blooms of Prince Alfred, Miss M. A. Haggas, John Lambard, Mrs. Robinson King, Princess of Wales, \&c. 2nd., Sir C. E. G. Phillips, Picton Castle (gr , Mr. Dumble), with good blooms of favourite varieties.
Troelve Jananesevarieties, distinct.-1.st, I. C.HANBITRY, Esq., of Edwin Molyneux, Mrs, H. Payne, J. \& Dibbens, Yiviand Morel, Chas Davis, Etoile de Lyon, sec.; 2nd, R. A. Bowrinn, Esq., with Lord Brooke, Duke of York, Duchess of York, Madame Carnot, Mdlle. T. Rey, de
Thwelve Incurved vicrieties, distinct.-1st, J. Masters, Esq., Ianelly (gr., Mr. J. Howe), with good Princess of Wales, Golden Empress, Mra. J. Gardener, Miss M. A. Haggas, Licy Kendall, \&c.; 2nd, Bir C. E. G. Prrllipy, with Baron Hirsch, dec.
Tioenty-jour distinct hlooms, for which a Challenge Cup, value £5 5s. was offeren, to be won twice before it comes the property of the exhibitor. A similar cup was won last year by Sir C. E.S. Prillips. 1st, R. W. D. Harley, Fsq, Hereford (gr., Mr. Robinson), with grand blooms of Madame Carnet, Viviand Morel, Niveum, Duke of York, E. Molynenx, Mons, Panckoucke, Miss D. Shed, Mrs. H. Payne, Mons. C. Molin Empress of India, Golden Empress, Lord Alcester, and Queen of England. Madame Carnot in this stanci wa selected as the best bloom in the show, and was fwarded the N. C. S. certificate : 2nd., Sir C. E. G. P
The N.U.S. certificate offered for the best Chrysanthemum plant in the show, was won by R. Dean, Esq., Newport, with a well cultivated, and profusely-flowered plant of Loni

\section*{LEWES CERYSANTEEMUM.}

November 13, 14.-Both the Town Hall and Corn Exchange were filled with good exhibits : but the cut flowers and miscellaneous groups formed the features of most interest. Groups of Chrys anthemums were generally not good.
The group covering a space of 60 square feet placed Mr. C Fennell, gr. to Mrs. Thorne, The Grange, Lewen, 1st. It
was a closely-arranged lot. The mixture of Ferns, Btove and was a closely-arranged lot. The mixture of Ferns, stuve and
greenhonse plants, was well done, Mr. J. Adams, gr. to the Mev. Sir G. Smifyifr, Coombe Place, Lewes, was 2nd.
Cut flowers caused strong competition, and in the class for 24 Japanese, Mr. J. Harwuod was 1st, and Mr. A. Slaughter, 2nd, in a very strong class. Mr. J. Heasman, gr. to Mrs. OxLey, Turner's Hill, was a gond lst for 24 incurved varieties, and Mr. C. Sayers, gr. to the Misses Cnoz, Nutley, was let for 12 of these varieties. Mr. A. Slacghter, Jarvis Villa, Steynhas, put up a grand lot in a class for 12 Japanese, and Mr. J. Coles, gr. to H. F. Walker, Eeq., Balcombe, beat him for 6 Japanese distinct. The competition in theee beat clanses was strong. Mr. J. Heassax, was 1st for 6 incurveds distinct ; and Mr. J. Hopkins, gr. to Mrs. Thoraton, Framifild, a good lot with grand blooms of Empress of India, in a class for six of one var. In astrongamateur

\section*{HULL CHRYSANTEEMUM.}

November 13, 14. - Many fine exhibitions have keen held in the Artillery Barracks under have auspices of the Hull Chrysanthemum Societr, but never has there been one of better quality thronghout than this one. Messrs. Harland \& Dixon are to be congratulated upon their success. Cut blooms though perhaps slightly less numerons than on some previous occasions, were better in quality than ever
In the class for twenty-four incurved blooms thero masa Erisk competition, and Mr. W. H. Lees, gr. to F. A. Bran lot of medium sized splendidly staged blooms. M. J. P Leadletter, gr. to A. Wicson, Esq., Tranby Croft, Hell, me 2nd. For twelve incurved, similar positions were taken by these two exhibitors
twenty-four blooms were mach the stronger. In that for hloom of \(M\). Pancknucke was awarded the premier poition in the show as the best Japanese bloom. Messes Pfarson and Sons, Chilwell, Notts, exhibited well, and were 2 nd. In the class for twelve blooms, Mr. H. Thompson, gr. to C. J. Risgrosf, Esq., Cottingham Grange, Huil, was 1st with a good collection. For thirty-six blooms in twelve varieties, to be shown in vases, three in each, 1 Hr. Leadbetter made acreditable display, and waslst anemoneflowered varieties were eqpecially well shown by Mr. . . Masun, gr. to A. Sxith, E sq., Woodleigh, Hessle. Mr. R Wilker, gr. to Col. Clitherow, Hotham Hall, Brough, had extremely fine specimens of reflexed varieties in his first prize stand of twelve blooms; Mr. Walker also presented the hest Pompon blooms. Mr. Wells, Eallswood Nurseries, had a remarkably fine stand of single-flowered varieties. Ams. teurs staged very commend \(\begin{aligned} \text { ble stands of blooms in classes }\end{aligned}\) set apart for them.

Sperimen plants formed a prominent feature of the show. Vast improvement was shown in this section For three trained plants, any varieties, Mr. J. Clark, gr. to A. Maypifld, Esq., Beverley Road, Newland, Hull
was list with freely fowered and not too formally trained specimens. Mr. F. Pops, Butcher Row, Beverles, had six really meriturious examples of bush-grown plants in the class for that section. "Cut-back" plants recelve con side able encouragement here; fo: six of these Mr. G. Coates, gr. to W. Wheati, Ey, Essq., Anlaby Road, Hull, \(1 \Delta t\), the plants being but a little over 3 feet high and carms ing good blooms.

\section*{Groups and Table Decorations}

Chrysanthemums interspersed with folieg flants are exhibiled splendidly at Hull. A Challenge ia value tw enty guineas being annually offered in this clas Mr. Con tes was success ful on this oceasion for the thind \(t\) and the vase now becomes his property. Five extreme yow groups were entered. Nit only it the arrangemen praivoworthy in these groups, but the plants ew ployed are of the highest quititity, \(p\) oducing a splemen did effect, arranged as they are aronnd the sides of entral building. Miscellaneons plants arranged for elea adled much to the interest of the show. Mr. G. Whaon, Sir J. Ruckur, 13 att, Swanland Lanor, Brough, ecured the one of the mist
Table decoration under artificial light adds to the interent f the show, open as the competition is to ladies only.
Upon this occasion Mrs. F. Topiam, Hotham Hall, Brougd, wis the most successful exhibitor, Mra. T. FAWLEY Jodek Helmsley, Cottingham, following, both having tastentily Helmsleg, Cotti

\section*{BOURNEMOUTE AND DISTRICI CHRYSANTHEMUM AND HORI CULTURAL}

Covemper 13, 14.- This admirably managed society held its annual exhibition of plants, blooms, fruits, vegetables, \&c., in the Winter Gue dens attached to the Hotel Mont Dore, Bounb mouth, on the above-mentioned dates, and m by the pronounced as one of the hest hitherto held by society, a fact which redounds to the reditary (ir excellent committce and energetic secretary with James Spong) and every one connected with show

\section*{Cut Blooms.}

The class for 36 cut-blooms, one-half Japanese and the others incurved, and not more than two of any one numbin was well won by Mr. N. Molynenx, gr. to Hants \({ }^{\text {and }}\) Wordfort, gr. to Major Blount, and Mr. Prosser, 8 . J. Miles, Esa., The Knolle, Wimborne, 2nd and abidg Mr. Grace (gr. to W. R. Neave, Eaf., F rarieties, ing, among others, very fine blnoms of Ceren 10 in President Borel, and Madane Carnot. ataged in this class Mr. Molynerx led in then ponding class for a like number of incurved bloom, Gach very fine specinens of popular varietion

Mr. Boote, gr, to F. Ricusion bloms.
of Japanese 'grand exarnples of Viviand Morel) as mell as the best \(\bar{n}\) bloums of incurvel (Hero of Stoke Newington). M Grace coming in 2nd in each class with Viviand Morel and Robert Petfield in fine form. Mr. Boore was also lst out o six stands stared for 10 Japanese. distinct, to which stand Paris, Mons. H. Payne, Etoile de Lfon, and Viviand Morel heing the must prominent hloums in this stand.
Grorps, covering an area of 100 square fect in the open nod 50 square feet in the amateur classes, were remarkably good. The plants were well-grown dwarf, cluthed with large, rich-inoking follage from the pots upwards, and surmonnted with large, fresh, fine homms. In the open class, foliage plants were allowed in the arrangement, Mensers. G. Fatrs \& Sons, Palace Nurseries, Bournemouth, were ac corded premier position: Mr. Inizam, Parkston Nurseries, lose to each other in point of merit.
Mr. W. Stretch put up a grand group in ommpatition for the Challenge Cup ; Br. G. Eldridge, gr. to G. W. Youno, Eaq,
Was a gond 2nd.
Graprs, Mr. J. Mrazies, South Lytchetts, Pool, had the
hest 3 bunches of Grapes in the open classes in Gros Colmar, hest 3 bunches of Grapes in the open classes in Gros Colmar,
fine in bunch, berry, and colour; and Mr. Mitchell, gr. to B. W. Flemisc, Esq., Chilworth Manor, Romsey, was 2nd,
with Black Alicante. Mr. James Chalk, gr. to Gpo. Read, Esan., Westwood, Salishury, had the best 3 bunches of white Grapes, showing Museat of Alexandria good in every reapect ; and Mr. Mitchfll was second. Mr. Menzifs was a successful exhibitor in the minor classes for Grapes,
Apples and Pears made a good show. Mr. Osbome, gr, to Rev. H. Mopkini, tonis 1st for threo dishes dessert Apples, and Mr. Masles, gr. to Miss Evans, was 1st for a like number of dishes of culinary varieties, the former staging excel-
lent fruits. Pears were creditably shown by Mr. Menzres and others. Vegetables were shown in great quantities, and in fine condition

\section*{TUNBRIDGE WELLS, MID-KENT, AND} EAST SUSSEX OERYSANTHEMUM.
November 13, 14.-A pretty thow was arranged in the Corn Exchange and Assembly Roome. Groupe of Chryanthemums and others of mixed plant were very good, but epecimen plants were poor. Nor were the Solanums and Poinsettian so good as nand. Taken collectively, there was conaiderable falling-off in the cut-flower clases, nome of these, inclading that for twenty-four incarved blooms, not obtaining one competitor
A Silver Cup for eight plants in pots, not to exceed 12 inches in diameter, was secured by Mr. J. Smooker, gr. to Mrs. Halt, Broadwater Down. A second Silver Cap for a group 12 feet by 8 feet, occasioned considerable competition, and the winner. had plants carrying really fine blooms. This group was more formal than that from Mr. J. SMOOKER, who was 2nd, but the flowers were better,
A group of miscellaneous planta from Mr. Berwick, gr. to J. Godden, Esq., Tunbridge Wells, was prettily arranged; but that from Mr. L. Dupond, gr. to C. B. Powell, Eeq. Southborough, was even more tssteful in arrangement, yet lacking in colour. For six dwarf-trained plants, Mr. J.
SMoorer was well in front, also for single specimens of incurved and Japanese.

Cut Blooms.
Nine compated in a class for twelve Japanese cut blooms, Mr. J. Howes, gr. to W. Cobs, Esq., Broad water Down,
being list with some grand blooms, although closely fol lowed by others that gained no award. The exhibits in thi class were to be arranged on a table 4 feet by 2 feet, with Ferns and other foliage for effect. The result was a very pretty lot, but we could not agree with the judges in their 2nd behind that blooms
ehind that in others
Twelve incurved blooms were shown in good form be Me. J. Lrag. gr. to Rev. E. H. Boardman, Groombridge, who wa followed by Mr. C. Harris, gr, to O. A. Smity, Esqo, Hammer wood, Elast Grinstead; Mr. J. Svow, The Gardens, Wadhurst, being lst for six varieties.
Mr. Harris was litt for twenty-four Japanese, closely followed by Mr. J. W. Moss, gr. to Mrs. Robingon, Matfield.
For twelve Japanese, Mr. E. Dove, Kr, to J. W. HaRDcastle, Esq.o, Hill Court, Edenbridge, won; Mr. Harris again coming in front for sir blooms; and Mr. J. Swow for mix of any one variety, with Mrs. H. Payne.

\section*{Miscellaneous Classes.}

For six benried plants, Mr, G. Tickwer won with a wellgrown lot of Solannms; and Mr. W. AUstiv was in front for six Poinsettias.
A class for six Orchids brought out some good pieces from Mr. C. Earl. gr. to Sir J. Goldsmid, Tonbridge; and Mr. J. Howea, gr. to W. Cobs, Keq., Broxd water Down.

Fruit was bright and sound, but not numerous. Mr. F. Bridger, gr. to Lord DF LisLe. Penshurst, was almost inviacible in these classes, taking premier honours for siz dishes of dessert Pears, and for three dishes of the same : for six dimhes of doseart Apples, for one dish, and for mir dishes of cooking Apples. Mr. Lege was lst for three dishes of dessert Apples; but Mr. Bridaer again came to the front for three dishes of kitchen Pears, and also for a aimilar quantity of cooking Apples.

Wegetab'es were very gool, the lst prize for a collection
open to members only, going to Mr. W. H. Wickens, ET. to Wherlwriat, Eeq., Nevill Park. who just beat ist. Standen.
Mr. J. Charlton put up a grand collection of vegetableo and horticultural sundries not for competition and a good lo of fruit came from Mr. A. Wileon, gr, to the Marquis of Aber giafenny, Eridge Castle.

\section*{BRISTOL CHRYSANTHEMUM}

November 13, 14.-The above bow wat a great naccess in every way. Exhibita were good and namerons, competition being in most cases keen Cut flower and specimen plants, IIkewise groups were well done. The show wat varied by the introduction of clanes for miacellaneous plants and \&lowers. Great intereat was taken in the compatition for the Cballenge Vave, value 12 gaineas, \(£ 5\) beiog sided to the 1st priza. This wai well won by Captain Marling (gr., Mr. McDonald), who wea alao saccessfal in other classes.
Fruit was well shown aloo, the various clacsen being well filled; the Grapes, although not sensational, were of good uality; likewise the Apples and Pears.
The vegetable competition being strong, for the special prizee offered by Messrs. SuTTOM \& Sows, drew a strong competition of first-pate quality; as did also those offered by the society, Mesurn. Brown \& Son, Mesors. W. Garraway a Co., and others.

\section*{LICHEIELD CERYSANTEEMUM}

November 13 14.-The second exbibition was held on the above date in the St. James's Hall. The Mayor, T. Ashmall, Evq, informed the large audience that Lichfield had held Hower ahows without a break for eaventy auccesaive yeart. Judging from the pre ment diaplay the exhibition should become a popular one.
The beat group of Chrysanthemums (open) whs ons from General Drotr. Yreeford Hall (Kr., Mr. Dix), who showod well grown plants of Viviand Morel, W. seward, Mra. E. Payne Beauty of Exmouth, and others. 2nd, W. F. Gordon, Eeq. Plants of Japanese varieties, distinct, were best from Cbarles Foster, Bart., Longdon; 2nd, Genemal Dyoty
Plants of Chrysanthemuma anitable for table decoration were good from Mr. A. O. Worthingitis; and a group of misceltaining nice specimens of Cuttleya sed Dendrobium, with taining nice specimens of Cattleyas and Dendrobium
Palmas, Crotons, \&c., was deserving of commendation.
The best twelve cut blooms of Japanese Chryennthemum The best twelve cut blooms of Japanese Chryannthemums were from General DyoxT:
Of Fruit, there was a large dieplay fo the class for two bunches of Black Grapes. Mr. Josepi Harvex wan 1st
Apples, in three dishes, desert varieties, were good from General Dyott. Mr. C. H. Inge won for three dishes of kitchen Apples.
Genesal Dyott was lat for a collection of vegetables in ight dishes.
Amongst the non-competitive exhibits, Mesars. Rivrrs \& Sons, sawbridge worth, had fine collections of Apples and Peara.

\section*{EDINBURGE BOTANIOAL}

November 14.-The first meeting of the sixtieth sestion of this Suciety was held at 5. S. Andrew Square, on the evening of Thardar, Profeamor F. C. Bower in the chair. Owing to the unfavourable weather prevailing the atteadance was mall. After the election of office-bearers for the seasion, which were balloted for and elected ananimously at proposed by the Council, the pablic business was proceeded with.
The principal item on the list was the address by the retiring President, Prolessor F. C. Bower, F.B.B.. who gave a paper on the life and work of Robert Brown; and in a very interesting coanner pointed ont the important work and principal traits in this great botanist's life, from his earliest efforts. The death of Professor Babington, who was one of the early momberg of this Society, was noticed with sympsthetic regret, and Profeseor Bower was asked to furnish an obituary notice of this old and celebratel botanist, for the Societv's Trazsactions In the abeence of the writer, Dr. David Paul, a communication on "Fangi observed in Glen Urquhart, Iaverness-bhire," whe read by the Assistant-Secretary, Mr. J. Terras, B. Sc.c, which, from the list given, seemed to be happy huntingground for these forms of plant-life. The Aesistant-Secnetary ground read the Report of Veretation made in the Royal Botaric Ganden by the Curator, Mr. B. Lindsay, for the past three Garden by the Curator, Mr. B, Lindsay, for the put thave months. During October, it was found that plants in fower were much injured by fronts, the fotlowing having Caring the month come into bloom in the rock-garden, viz, Campanala garganica, Morina longiflors, Btachys densiflora, Verbsecum Chaixiii, H

In the metoorological observations recorded at the Royal Botanic Gardon during October, the following few items from Mr. A. D. Richardson's report wore noted. The mean of barometer readings reduced to \(32^{\circ}\), and takea at 9 A.M., whe 29.708 inches, or the name as the average for five previous years. The higheat reading of the protected maximum thermometer

Wha \(62^{\circ} \cdot 8\), on the let; minimum, \(28^{\circ \circ} 2\), on the 20 th. Front occurred on sir dayy. Hykrometer in screen: Mean of drybulb, \(44^{\circ} 1\) : wet-bulb, \(41^{\circ} \mathrm{B}\); dem point, \(38^{\circ} \cdot 6\). Redintioa thermometer : Maximum in sun, \(107^{\circ} 7\), on the 12 th ; minimum on grase, \(14^{\circ} \cdot 9\), on the 28 th . Frost occarred on gram on eighteen daye. Rain, \&c., fell on seventeen dayo. Total fall, 3.230 inches. Greatest fall in twenty-four houm. 0.820 inches on the lat. A few plants and epecimens from the housen of the Botanio Garden wero exhibited, facludive Melamtome malubathrica. Vitio heterophylle humulifolin, Vanda Kimmallianna, and others; and notes upon plante of interent therein, were read by Mr. R. L. Harrow. Theonew Ireeident for the gension, Dr. A. Aitken, M.A., D.Sc., Ec., occupie1 the chair during part of the evening.

\section*{EALING HORTICULTURAL.}

Nowmern 14 -The eighteenth annal exhibition of Chrysanthemums, \&ce, took place in the Victoria Hall on the above date, bringing tozether a atiffactory diuplay, both of plants and cat flowers.

Hope Halr, Eeq., Wimbledon also clunters of Grapa Reine a good lot of Apples and Pears also clunters of Graps Reine Olga de Wurtemberg, which prosamaged by the Secretary, Mr. W. B. Theramon.

BECCLES AND DISTRICT CHRYSAN THEMOM AND FLORICULTURAL
November 14, 15.-The nixth annual exhibition held in the Town Hall, notwithstanding it clashed with other show in the connty, was satisfactory
The plants in pots wers superior to those shown in former ears, pot orly in the better quality of the blooms, but the years, not only in the better qualisy were furnished with good foliage down to their base. for three plants in pots (Jap znese). Sir R. Beauchamp Langley Park, was 1st; and Alderman Mastirs, Beccles, 2nd. In the classes for plants of incurved, reflexed, and Pompon larieties, Alderman Masters, Mrs. H. Read, and Mrs.W.W Worswick were the principal exhibitors, the prizes being warded in the order named.
Groupz of Chryeanthemums were an attractive feature of he show, Mrs. H. Read taking the lat prize
ine lot ; 2ad, Mr. E. Lawrence, also good.
For cut bloome, Japanese, in twelve varieties, Mr. NewMans For cut blooms, Japanese, in twelve varieties, Good example Yarmouth, was 1st ; 2nd, Alderman Masters. Mre. H. Payne of Viviand Morel, C. Davis, Stanstead White, Mre. H. Payne Mdlle. Théresse
Miss TAyLor, Starston, was let for gir Japanese blooms, howing good specimens of Colonel Smith, Beauty of Exmouth and Princess May. Incusved varieties were shown well by Mr. Sutton, Yarmouth, with Mrs. H. Read and Alderman Masters.

Amateurs, or those rot employing a gardener regularly, also contributed largely towards the success of the show.

\section*{SCOTTISH HORTICULTURAL}

November 14 15, 16. - The ninth annual Chryanthemumahow of the Society was opened in the Waverley Market on Thuraday, the 14 sh inst. It must have been apparent to visitore who have been in the habit of reeing the annual exhibitions that this one was at leastas good as any previous display. The market presented a fall and well-furnished appearance from all siden, and a view from the gallery, owing to the brilliant colour being toned down by the foliage plants and Ferns, as well as by occasional groupp, was distinctly pleasing.
In the large classes for cut blooms, more than the usual numbar of exhibitors competed, and their flowers were of high merit. Plants, although better than in previous years, still lack the dimensions oceasionally seen in some other leading shows.
Fruitalso was indicative that the past season has b'ea favourable to its proper development. Vegetables, which w 3 usually expect good at Edinburgh, were exce!lent, and the
competition in most classes keen. Several of the nursergmen contributed to the display by the exhibition of apecialties in plants, flowers, and other miscellaneous exhibits.
Mr. Campbell, of High Blantyre, arranged a table of Car nations and Ferns, and a circular stand of Crotons, Palme, Heaths, \&c.
Mr. H. Jonks of Ryecroft Nurseries had a table of excellent kinds of Japanese a nd incurved varieties of Chrysanthemums.
A table of highly-coloured Kale, from the original stoslr of the late Miss Eope of Wardie Lodge, Edinburgh, was interesting; while some enormous Marrows and other vegetabies were staged from Mr. J. Ecarlett of Iaveresk; examples of preserves from these being also showa.
There was a table of articles for sale in aid of the Gardeners' Orphan Fund, which we hope was successful.
Messra. DOBbie \& Co, Rothesay, staged a table of Chrysanthemums, including some of the newer varieties.

\section*{Plants}

For six distinct varieties of Chrysanthemums there ware four competitorp. It was the principal clase for pot-plants, servedly 1et, though Mr. J. Holmes, Winton Castle, Pencait land, was a good 2nd.
Pumpons.-In the clase for four trained plants, those from Mr HUNT, Coltbridge, Murrayfield, were very commendible; Mr. J. Holmes again taking gad honours. Mr. D Cavanagh was also let with four Japanese, his plants of Viriand Morel, Wal d'Andorre, and Margot, boing very good; 2nd. Mr. J. Hol Mes Mr. D. Jardine, Raveliston, Blackhall, staged fide specimens in the clase for two plants of Japanese. The 1st prize for plant of a white-flowering Chrysanthemum was a warded to a well-gr own plant of Rouquet de Dame, from Mr. D. Cavanager. Mr. S. Abbott, Prestonfield House, Edinburgh, carried cff 1st honours for a yellow variety, with a magnificent plant of W. H. Lincoln.

In the class for a spacimen plant of an Anemone-flowerod varisty. Mr. J. Holmes was lat with a pretty apecimen of Dorothy Soullet; and the best Pompon was ahown by Mr. G Wood, Oswald Houee, Edinburgh. Some remarkably well. grown plants were shown by amateurs, in some cases almost equalling those from professional gardenere. The classes were also well contested.
Mr. R. Meckose, 8, Great Stuart Street, Edinburgh, wad 1st in the class for two plants of large flowered varieties; and Mies G. Munro, Beo Cottage, Pencaitland, 2nd. Mr. R. H. McBear, 6. West Montgomery Place, Edinburgh, was suc cessful in carrying off the 1st p:izes for two Pompons, on large-flowered variety, and also one plant of a white-flowere Japacese variety, his exhibite boing good is regard to the bloomes and the truiniog.

\section*{Cut Bloons.}

These classes on the present occasion, as always, were the principal attraction of the show. That for forty-eing Japinese, distinct, secured a large share of the attention of visitors, and as not a bad bloom was to be found upon the boards of the 1st pr ze exhibit, this was scareely a matter of surprise. The 1st prize, of a plate value \(£ 30\), presented by the Lord Provost, Magistrates, and Tuwn Council, and called the City of Edinburgh Priz?, was won by the wonderfully sacee the exhibitor, Mr. W. H. Lees, gr. to F. A. Bevar, Beq, Tmet Park, New Barnet, and his blooms included M, idame., Tment (awarded the prize to the best Japanese bloon in thi er. (abition) Mrs. Wheeler, Reine d'Angleterre, G. W/ Childs. Abbé Mendehall, Primrose League, E. Molynour, Mathen Octa i: Mirabeau, G. C. Schwabe, Mjns. O. Molia, Mona Panck sucks, Mrs. W. Godfrey, Duchess of Wellinton, o Shrimpto, Mins. Greyer, International, Phabens, B:an'é Toulousaine, Rose Wynne, Madame Girond, Madame A, if Gulbert, Etuile de Lyon, Mephisto, Madame Moali, J. Sht ton, Lady Saunders, Mrs. C. H. Payne, Mutaal Priend, Iteri Jacotot Fils, Sunflower, Pres. Borel, Florence Daris, Xinema, Richard Dean, Wilfrid Marshall, Madame Adaua Curtia, Charles Davis, Madame M. Ricoud, Mrs. F. Jumema, Mr. W. H. Lees, Beauty of Castlewood, Colonel Cowe, and others. The 2nd prize fell to Mr. J. Brasurs,
Castle Huntly, Longforgan, who in the two previous gean han gained the premier position. Mr.J. Carruthers, Hill Corstophine, 3rd.
In the cass for twenty-four Jadanese, or the Scotisht Challenge Cup class (open to Scottish gardeners and amstean only), Mr. D. Nicoll, Rossie, Forgandenny, took lat piza with excellent blooms, fllawed by Mr. J. Bersuyt, Mr, Carruterers stajed the best lot of twelve blooms.
For twelve incurved blooms, Mr. J. Claris, Bamerfild Selkirk, was 1st, and his stand included a bloom of C. Cutien which recoived honours as the best incurved shown. Othen noted wore Lrey Kəndal, Mrs. Culman, Princess of Wulem Lord Alcester, and Alifed Salter; 2nd, Mr. J. Martis, Wimet combe.
In the classes for six blooms of the following rarieties, K , L. Geddes was 1st, namely, E. Molgneux, Stansted White, and Mdlle. Thé eje Rey. Three magnificent blooms of Duches an Mork whe the Corstorphine.
Blooms arranged in vases were this year more numeror and were generaliy admired, In the clase for twelve naw of Japanese blooma, M P. J. Lees. with splendid flowers, securd 1st prize: Mr. J. Clark, Selkirk, being 2 a i.
For sir vases, Mr. J. Kidd, Carberry To wers, Musselbergh was 1st. For one vase, to contain twelve Japanese blome mo. J Carbutherz was ist.
Ia the class for an epergne of Chryanthemums (opel to ladies only), Mrs. R. Laird, Edinnburgh, staged an efitiv arrangement.

Mr. A. Brycor was the principal winner of prizy in th amateur classes for cat flowers, securing lst placa for thir an iffor six. Japanese blooms as well as for sir bloomid white Japanese variety. Mr. T. M. Whiterean tait if prize for sir incurvel blooms.
The thrse best blooms of one variety not in commeno nim from Mr. A. Kirk. Alloa, who won the Society's siliver with a variaty named Mrs, A. Kink, a vanety wial florets, stripad with a light yel'ow band

\section*{Fruit.}

Some first-class Grapes were noted, and these men wh principal exh bits. In the c'ass for four bunches, dictions
 el-haished berries of Muscat of Alexzndris, Alicame, colmar, and Gros Maroc; Mr. W. Murray, Pomander 2ard. Mr J. Lescie was also lst in the class for two Muatu with Biack Alic nnte and Muscat of Alesanime the list pian in from Mr. J. MCNEIL, Peebles, secured . For two bander two bunches; Mr. D KidD beiog 2 da,
Groe Culmar, Mr. H. A. WALKER, Colinton, was lit, will fine large berries, wall coloured, followed by Mr. A. Yolan Peobles.

Pine-apples were not numerous ; the two beit wore the Mr. Mctutyre,
Mr. MCINTXRE also won the lat prize for a colludiar \(t\) welve dishes of fruit, including Grapes. Melons, Figst, M, Mon acc.;

\section*{2nd.}

The best collection of eighteen rarieties of Appian six varieties of Pears, produce growa in Sootiand, coldetw mgritorious lot from M
some of his finest examples being King Pippia, wi. Pippin, Sandringham, and Blenheim Orange; Rennie, Efrol.
Mp. J. DAY, Garliestoa, securad 1st place in the open
 with exoeptionally fine fruic thr oaghoat ; Mr. Ayr, being 2nd.
In the only claes for Pears, Mr. F. Trioxsox, Yothed wh lat for six varieties.
The clase for market-growers was one for uir nim zow Apples in baskets, ae packed for marizet; and ansisor, 倍 Coldstream, was ist; followed by Mr. D. MOJUN

\section*{Vegetabris.}

The vegetables ware oxtremely good, and occupids onsiderable sface. The 1 te prize-winner for Mr. R. F. RAR, Sunlaws, R)wb righ, who bal Peas, Tomatos, Onions, Beet, B assel 8 proizs, Celery, Leeks, Cabbare, and Cucumbers, all wr. J. W, Dollar, was lat, and Mr, A. Diocson, Lamail

The bestTomatos were those from Mr. J. Paterson, Kirkcaldy whose \(t\) welve even fruits were very fine. Leeks of enormous size were extensively shown. The best eight were from Mr D. Logan, Coldstream. This exhibitor also won 1st prize for Celery with grand heads. Carrots, Turaipa, Beetroot, and other seasonable vegetables were well shown.

A good collection of Vegetables, open to market growers only, was staged by Mr. W. Smeall and Mr. D. Loein, who carried off lst and 2nd prizes.

\section*{Nurgerfmen's Olasges}

Some good exhibits both of cut flowers and plants were made by nurserymen. The lst prize for thirty-sir Japanese Chrysanthemums was gained by Mr. R Wood, Oarnoustie, who had some first-claes flowers, Mr.W.W ELLS, Redhill, Surrey, was let for twenty-four incurved blooms, and showed good varieties, and of large size and fine colour.

For the best collections of Conifers two good groups were brought by Mesars. R. B, Laird \& Sows and Messrs. J. Dick sON \& SONS, Edinburgh. These two firms taking prizes in the order mentioned. Some fine plants of Retinosporas, Cupressus, Juniperus, were noted amongat the mavy interesting forms.

Miscellaneoua Classes.
Four competitors arranged groups of plants in cirsles, the best being by Mr. P. Hunt; Mr. G. Wood was a olose 3nd The classes for table and berried plants, Pelargoniums. Primulas, and other stove and greenhouse plants, ware used frimulas, and other store and greenhoase plants, ware used contested.
Wet weather was general during the three days on which the show was open, but a large number of visitors attended during the last two daye.

\section*{S TOOKPORT CHRYSANTEEMTM.}

November 15, 16 -Thia mociety in gaining in atrength and importance each vear. If is held in the Volanteer Armonry, a large bailding in every way aited for an exaibition of plant and flowers. The Chryanthemums covered a large amonnt of table apace, notwithetanding the fife-two shows held during the week in northern Eagland, the Japanese ection particalarly being grand. Fruit was aelect and cood, particularly some of the dishen of Apples and Pearm.
Among the prize-takers for plants in pots were Captain T. H. Syres, Messts. G. H. Gaddsm, J, C. Chorlin, and J. Brown. They were gecarally a creditable lot of plants, with vigorous.
In the Japanese cut-flower section the competition was apirited and close, Mr. Boderick, Gr, to Captain Srkes, aed Mr. Richardson, gr, to JAs. E. Platr, Esq., carrying off chief hoo vurs, although the respective gerdeners to the Corporation of Stockport, G. H. Gaddam, Foq.. J. Evains, Keq., J. Lereg. Esq., G. L. Dewiuld Esq., say others, snowed well in all the c chases. The more promiaent Japanese blooms were Primrove Laggue, an immense pale primeose; Mr. G. W. Clarke. Jilac and white; Duke of York, a prononacel pale purple and white, the florets broadish, and the coloups blended in captivating atyle; Lord Brooke, orange and brownshaded Gloriosum, a very fine yellow; Chas. Divies, orange and aienna, are of the best; Viviand Morel, good wherever shown; Mre. H. Payne, E. Molyneux, Princess Miy, Stanstead White, a grand flower M Panckoucke, Presidənt Borel, Madam, Hoste, and 8. O. Shrabe. Among the incurved we noted Lord Alcoster Princess of Wales, John Duughty, Queen of England (still a leading flower). Golden Empress. Lord Wolseley, Empress of Iadia, C. B. Whitnal. Jeanne d'Are, John Lambert, Violet Zanber, Madamo Dariar, Prince Alfred, and Baron Hirsch. Among others, Hairy Wonder is notable. Mrs. J. B. Benedict was one of the more prominent of the quilled or Anemone seotion, with yellow florets in contre, and flushed pink guardpetals.
There were a fow good Orchids from Mr. Rodencer, parti cularly the Chantini form of Cypripedinm insigae; and the table plants were choice. The bouquets comprised many good flowers, and were of varions 'forms, from the circular com pact one presented to the Mayorees at the opening, to the spray ones, with Srailax and Asparagus, which now lead the fashion.
There was one capital exhibit of a group of Araucaria oxcelos, chiefly table-size plants in perfection of contour, from Mr. John Brreet, a local dealer. The plant were all from cuttiog. Mr. J. Wooler had a nice assortment of showy flowering plants, and several gentlemen in the district sent contributions of Palms. Ferns, gentlemen in to decorate the platforms.

The Fruit consisted of good Alicante Grapes from Captain 8ykes and others; the Muscats were far above the average. The Pears and Apples from Mr. McKellar, gr. to Jus. Warts, Esq., Abney Hall, were select, high coloured, and generally good.

\section*{LONGTON CHRXSANTHEMUM.}

November 12.-The Sixth Annual Show of this Society was opened in the Town Hall, on the above date. The object of the promoters is to encourage the growth of the uueen of winter flowers amongst the artisans of the district. Since its formation the growth of the society has been rapid, and the quality and numbers of the flowers staged on this occasion were very astiefactory.

In the open difision the hest twenty-four blooms incurvod distinct were from Mr. J. MoPzail, Supdt. Queen's Parle, Longton, who staged excellent blooms of Empress of India, Queen of England, Charles H. Curtis, Baron Hirach, Jeanne d'Arc, Empress Eugenio, \&cc. 2nd, Mr. J. Sropps, Derby, Mr. J. McPuail was also 1 st for six liocurved blooms distinct and for twenty-four Japanese distinct. In the latter clana he had good blooms of Edwin Molyneux, Sunflower, Good Gracious, Viscountess Hambledon, \&c. Ind, Mr. Stoprs. In the amateur section, where the classes are cunfined to residents in the borough of longton, seventeen competitors entered for six blooms distinct. The lst Prize, a Silver Cup and Certificate of the National Chrysanthemum Soclety, was awarded to Mr. A. Tays for a fine stand containing O. H. Curtis, Queen of England, Baron Hirsch, Empress of India, Lord Wolseley, Iord Alcester. 2nd, Mr. H. Warren. All the competitors in this class receive a prize.
For a group of Chrysanthemums for which the Certificate of the National Chrysanthemum Soclety, together with the prizes was offered Mr. B. Brias won with a well-arranged lot.

The three best plants of Japanese varfetien distlnct wor from Mr. J. Warren.
The other and minor classes were generally satisfactory. Some fine bunches of Gros Colmar Grapes were sent by . Tams, Esqo, the Hayes stone (gr., Mr. Bates)
Messre. Hrlu \& Sows, Spotacre Nurseries, staged cut flowers and plants.

\section*{YEOVIL CHRYSANTHEMUM.}

November 13.-The eighth annual exbibition of plants, cut blooms, fruits, and vegetables, in the municipal buildings on the above-mentioned date, was one of the best held by the Society, and much credit is due to the Committee and Hov. Sec. (Mr. E. H. Oakley) for the unsparing efforts put forth to achieve this result.
As usual, Mr. A. Crossman, gr. to J. Brotron, Eisq., Yeo-
vil, secured premier position for a grand group of Chryannthemum plants in pots, this being the seventh year in succession in which Mr. Crossman has won the chief place in this class. Mr. Biss, gr. to J. Bradrord, Esq., had the best group of miscellaneous plants, which wero arranged with ex. collent taste and effect.
Cut hhoms madea fine show in themselves. Three-hundred and twenty-four excellent flowers were staged in the chief class-thirty-six Japanese in not fewer than twenty-four
varieties-for the Mayor's prize \({ }^{2,5}\) were best from
Mr. Thomas Wilkins, gr. to Lady Theodura Gurst, Inwood House, Henstridge. His collection was of high merit, and included grand blonms of the most prominent varieties, and were large, solid, freah, and uniform in sirye, and admirably set up. Mr. Alleopp, gr. to Lord Portuan, Bryanston, Blandford, and Mr. Lloyd, gr. to Vincemr Stuckey, Esq., Langport, also showed well in this class. In other classes Mr. Copp, gr. to W. E. S. Hele Drax, Esq., Holuest House, Sherborne, and Mr. Wilkiss were winners of 1 st prizes, the former for twelve incurved blooms, distinct varieties, and the latter for a like number of Japanese. Fruit made a good display. Seven collections of six kinds were staged. The contest between Mr. Lloyd and Mr. H. W. WARD, Lonyford Castle, Saliebury, was a keen one. Ultimately the prizes were awarded in the order in which the exhibitors' names appear. Mr. WARD was 1st in several classes for Grapes, and Mr. Lioyd in another one.
is satisfactory to be able to speak well of the produce grown and shown by the cottagers residing around Ycovil. So good, indeed, were their exhibits this year, that the mayor promised to contribute another five guineas to the lint of prizes to be competed for by cottagers next November.

\section*{MABGATE AND ISLE OF THANET.}

November 13, 14 -This exhibition wat one of the very beat held in Kant daring the present season. Not only were the Chrysanthemums (both plante, groupt, and cut fiowers) of high excellence, but the fruit also and vegetables were atrongly repremented. The arrangement were better than last year, the cut flowers being placed in a better light. Many other mocieties would do well to follow the plan adopted at Margate, of placing the semicircular groups back to back, thus forming circles down the centre of the hall.
The class for a group of Chrysanthemums bronght out a atrong competition. Mr. Corwford, The Gardens, Quex Park, Birchington, was deservedly list, with a apleadid gromp, both in quality and arrangement. The dwarf-grown plants with which the group was fnidhed addel greatly to the effect. Mr, Roberts, gro to sebac Mowterions, East Ulite Loige,
 Ramgate, staged well for mad place, the large manive
For a miscellaneous group of flowering and foliago-plantr, Mr. Cornford was again to the tront with a light and trateful arrangement.
Specimea plante were stroogly represented in a number of clases, the chief of which were the following:- For tix trained apecimens, any variety. Mr. Miller, gr. to J. T. Fric protusely-flowered plants of Medame Lsoroix. Bouquet

Fait (very ine), M. Berthe mandetlop. Mer. Geo. Glengy Mrs. Dixon, and La Triomphanto (apooilily good). Mf. Cormrord followed in thie clan
With four trained plants of incurred varieties, Mr. CosmFORD was lst, the Rundle family boing well repreeented. The same exhibitor was lut for threo epenimeas of refiexed varioties; Mr. J. Burley.gr. to A. B. WAREE. Req., Wert Clity Houne, Ramangate. following with amulier planta.
In the clas for four Japaneve, the compotition between the lat and gad prize exhibit was very heen, the pooftions of the two previous wingers being reveried.
Mr. Burlity agein won for a wíngle specimen Japadee with an admirsble plant of Val d'Andorre.
The best single inourved was from Mr. E. Hawkion, gro to Sír E. WIATT, Mainoaette, Brondetaire.
An excollent and very nuggentive cles was one provided for five plants in 6 -inoh pots, suitable for table decoretion, bat the mistake mede in more than one instance was, that of forma taking and training. The let asard wont to a protty, graceful oet of plants. from Mr. H. Millere, no training being attempted; Mr. J. Burley, who wan 2nd, followed in amme What similar st yle.
Cut flowers.-The competition was very keen, and the quality first-rate. For twonty-lour incurved varietios, Mr Enden, gr. to Major Bell. Thor, Birchington, whe lot; the finest blooms were those of Benuty, St. Patrick. Lord Alcester Mrs. Heale, and Violet Tomlin ; Mr. Cornford was 2ad.
Mr. Enden occupied the same position for twelve varietion with similarly good flowers: Mr. Hollyman, gr. to G. Frgeek, Eeq., St. Peter's Court, 8t. Petern, following.
For six blooms, Mr. Standing, gr. to W. Gay, Ieq, Grove House, Weatgate, was lat.
Mr. Ennen had the bet three blooms of any incurved variety with Mras Heale.
With twenty-four varietiee of Japances in a very strong clase, Mr. F. Miller was let with an oven oxhibit, both colour and aize being atrong poiath. Mr. BollyMax followed closely in this class. For twelve varieties, Mr. Hollymar turned the tables on his opposent, and won.
Mr. Cormpord was lat for air varieties, his beet being Marie Hoste and Van der Hesde, rich in colour. Mr. Holrimam and. For six blooms in es many kinds of white ranieties, Mr. EmDer won with Marie Eosto, Théres se Rey, Florence Davis, Benuty of Exmouth, and Stanatead White, as the beot; Mr. Corrford, 2ad.
Mr. EMDEM was lat for reflered varieties, the Chrietinee and Cloth of Gold being very fine ; Mr. Cornford followed. Mr सкрek was the most succosofal also for Ancmone-flowered varieties, Delaware, Sabine, and Dame Blanche being the best. Fur twelve trebles in bunches, Mr. Wilkins, gr. to H. fine dieplay, the flowars of medium size, and good colour. Another, and an extra stroag clase, was that open to all comares in which Mr. Fanaweathen, The Gardens, Bifrons Park, Oanterbury, was 1st with twelve Japanese and twolve in curved blooms. Mr. G. Ray, The Eill, Green Street, Teynham, was a worthy 2nd.
The best besket of Chrymanthemums came from Mise J. Reeve, a beautiful arrangement.
Mr. Leadbetter, gr, to A. G. HUBBUCx, Esq., Chisleharst, showed forty-eight b:ooms of the beat varieties of Japanees. in extra fine condition, the best of the newer kinde being very prominent.

\section*{FINOHLEY CHRYSANTHEMOM.}

Novembre 14 15 -The Chryannthemam Societyat Finchley held its tenth annual exhibition in the New Lectare Hall at that place, where better accommodation exiata than the Society bas heretofore enjoyed. The exbibition was not less excellent than the best of those beld previounly, the blooms of Japaneve varieties being enpecially noteworthy among other exhibits of a general atisfactory character.
The Trophy Cup oflered by the Society for the beet collection of thirty six blooms was won by Mr. J. H. Walker, ar. at Goldbeater, Mill Hill N.W., wilh an exhibit containing blooms of finer quality than woy exhibited at pre vions shows. This being the third aucoessive yesr Mr Walker has held the Cup, it now becomes his onn property. Mr. Walker also took, on the occasion under
notice, twelve other let prizee. Mr. D. M. Hayler. gr. to Mr. W. notice, twelve other let prizeo. Mr. D. M. Hayler. gr. to Mr. W.
HANMAEORD, was another of the more succestul exhibitore, taking eleran 2nd prizes. In all there were sistr-aix clases, including those for fruit, vegetables, and miscellaneous plats.

\section*{BRADFORD CHRYSANTHEMUM}

November 15, 16.-Bradford witneseed the ninth annual +xhibition of it Curysanthemum Society on the above dates, in the St. George's Hall, where it was opened by the Prenident, Al erman W. Wood, Mayor of the Burough. Generally the bow wat more than astisfactory, and the exhibite covered a larger apace than at any of the previous exhibitions.
The leading clane for twenty-four Japanere bloome, in which the gilver Challenge Cup was linked with the lst prize, was well won by W. H. TATE, Eieq.e Wootton, Liverpool (gT., Mr. W. Haigh), and he was followed by C. J. Ormrod. Eeq. Brighouse, Bradford (Gr, Mr. A. Barber), both of whom managed to beat a collection from Mr. W. Wells, Earlawood Nursery, Surrey. The lat damed exhikitor, however, 0003piol
ood blooms of Mrs. R. C. Kingston, Princeses of Wales, and good blooms of Mrs. R. O. Kingston, Princess of Walas, and Jno. Salter; W. H. Tate, Esqas Was 2nd in this class, 1st for twalve blooms. Japanese ;
In the local classes, the Challenge Cup was won by J. W. Cockeriam, Esq., Bingley (gT.o Mr. T. Burrell), who had a very creditable collection of twelve Japanese blooms.

\section*{THE WORCESTERSEIRE BRANCE OF THE GARDENERS' ROYAL BENEVOLENT INSTITUTION.}

November 18.-The inagaration ceremony took place on the above date, in the Gaildhall, Worceater. Earl Beanchamp, the president, occupied the chair, supported by Col. Long, M.P., A. Baldwin, M.P. Canon Coventry, Col. Scallard, Rev. Thatcher, R. S. Carrington, Esq., and other counts gentlemen. There wan a crowded meeting of gardenera, and great enshusiatm prevailed.
His Lordship, when explaining the objects of the meeting. pointed out the necessity for forming a branch in the district, stating that pensioners of the parent inetitution, now residing in the connty, were actually receiving considerably more money annually in the shape of pensions than was yearly subecribed ia the county. The duty of gardeners to embrace this mean of "self-help," who by reason of their occupation in hot-huuses and exposure to extremes of temperatures, were so prone to rbeumatiam and other ailments at early stages of life, leading to possible incapacity for active work, was clearly set forth.
The depatation consisted of Messrs. Harry Veitch. Ingram (Secretary), and Vallance, of the Bristol Auxiliary. Mr. Veitch clearly explained the great advantages of the Institution, and gave statistics, showing the progress which has been made, and the amount of money paid to deserving cases, and also alluded pathetically to the large number of deserving candidates seeking relief, for which the funds are inadequate. It was also shown with what care every case was dealt with in committee. Mr. Veitch incidentally remarked that one pensioner, now deceased, had paid into the Society some eighteen guineas, and lied received therefrom in pensions upwards of 2500 .
Oolonel Long. M.P., who represents the Evesham division, including the body of market gardeners, then proposed, "That this meeting having heard the claims and objects of the Institution, hertby resolves to form an auxiliary branch of the Gardeners' Royal Benevolent Institution for Worcestershire and district, and to enrol members forthwith, eubject to the rules of the parent society, and the usual byelaws for loesl management hitherto granted to existing auxiliaries."
This was seconded by Mr. Crump, Madresfield, and, being supported, was carried unanimously, amidat great applause. Votes of thanks to the deputation were given, and acknowledged, Mr. Vallance specially dealing with the usefulness of an auxiliary as a means of spreading knowledge to gardeners of the Society's existence and aims, as well as to furnish local information to head-quarters. Mr. Ingram also pointed out the necessity for additional auziliaries in counties, and hoped the Worcestershire example would be copied.
The Rev. Canon Coventry moved a hearty vote of thanks to the chairman, and brought an enthusiastic and successful meeting to a close. A committee of management was at once formed, and business of a routine character followed.

\section*{The Herbaceous Border.}

\section*{HERBACEOUS PRONIES.}

Ir it in intended to increase the stock of these handsome flowering plants, the present time is aitable. The early autumn monthe sre the most favourable during the whole year. I have meen it recommended that thene Pronien be planted in the early part of the year, when young growthe a few inchen long have been made. Such a time is about the worst that could be selected, and will asauredly prove dianstrous to the plants. Unlike a large number of hardy plante, these Pronien do not prodace roote in continuous auccestion, but in decisive batchen at fixed periods. Did they produce root-fibres continuouly, the check by shifting would be little more than momentary. But it is not mo, and unles they are planted at a suitable time, they take two, and nometime three yearn to recover. If a fall growth be not made, the crown bud will be only partially developed, and the ensaing year's growth is proportionately feeble. When the planting in cone in the early atama, the main roots are more or lees preserved intact; and this item in the caltivation of the plants I regard as very importent, and upon it depand much of their future succes.

Few plants produce a more showy diaplay than Pronies when in full bloom in the early summer
month. Some of the beat effect are produced when large bede can be devoted to them on the lawn, or again, when planted in the fore-front of large ahrubi. Do not plant them near to large trees, or they will be sure to lack nourishment as well as moisture. In all cases a very rich soil mast be given them, preferably one of loam, though in this respect they are by no means exacting. Dry hot sandy soils are not saitable for them, anless a depth of 6 inches of clay can be added and well mixed. The soil should be trenched fully 2 feet deep, and a very liberal dreasing of manure added at 1 foot deep, as the roots quickly descend when they have the opportunity. Plant the roota quite firmly, and cover the crowns about 2 inches deep with soil, adding a heavy mulch of manare when the work of planting is finished. It is neceasary to do the work well, as when entablished the planta are beat left alone for at least a dozen years. Sach old-eatablished beds will, however, be much improved by a heavy mulch of manare early in the autamn of each year. The crowns should be encouraged far into the autumn, as they plump up considerably at this season. \(J_{0}\)

Witley Court.-We are reminded by the Journal," that Mr. Austen, the gardener at Witley Court, will soon retire from hin post and go into business; Mr. Young will leave Abberley at Mr. Austen's anccessor.

[The tarm " accumulated temperature" indicates the aggre gate amount, as well bs the duration, of degrees of named and this combined result is expressed in Daynamed : and "Day-degree" signifying \(1^{\circ}\) continued for twenty-four hours, or any ot her number of degrees for an inversely proportional number of hours.]

THEPANTWERK.
The following aummary recorl of the weather throughout the Britioh Islands for the week ending November 16, is farninhed from the Meteorological Office:-

The weather darion thie period was again oxtremely unsettled, frequent and coneiderable fall of cain, alternating with intervals of cleser shy and sunchine.

The tempercture was above the mean, the excem ranging from \(1^{\circ}\) in "Seotland, I." and over Irotand, to \(5^{\circ}\) in the
"Mrdand Counties" and "England, 8.W. and E.," and to \(6^{\circ}\) in

England, S.' The highert'ot ithe' maxima, were recorded on the 16 th over England, "and earlier in thefweek "over Ireland and Scatland. They were very high for the time of year having ranged from \(65^{\circ}\) in "England, \(E_{0, \prime} 64^{\circ}\) in 'Evaland, 8. and \(68^{\circ}\) or \(63^{\circ}\) in the other Eeglish districts, to \(55^{\circ}\) in 'Ireland, \(\mathrm{N}^{\prime}\) ' and 'Scotland, N.' The lowest of the minima occumed about the middle of the period, and varied from \(28^{\circ}\) in \({ }^{\circ}\) sent land, N., to \(37^{\circ}\) in 'England, N.W."' and to \(44^{\circ}\) is ths ' Channel Islands.

The rainfa \(l\) was a little less than the mean in ' Kagland, E., 'and only just equailed it in 'England, N.E.'; in all other districts, however, there was an excess, that in antly ail localities being very large.

The bright sunshine was more prevalent generally than that recorded during the preceding woek, and exceeded the normal amount in all districts. The percentage of the paible duration ranged from 37 in 'England, E. . 36 in the 'Chanel
 and 10 in 'Scotland, N.'

Buildina World."-This is the title of a new illuetrated weekly journal, which is pabliched by Mesars. Casselc \& Co. (La Belle Savare, E C.): The paper deals with all branches nf the bailding trade, inclading carpentry, plumbing, whitewashing, \&c., the nteful information thereon given being applemented by varions illuatrations. For the price asked-a penny-the paper is certainly a good avd

\section*{Trade Notice.}

Jomi Ceanston having removed from the King's Acre Narseries, will feel obliged by all commanications being now addressed-Jorm Ceanston, Little Birch, near Hereford.

Adderss: W. Cockin, The Dell, Egham.
Azalea modica Grafting: Co \(H\). J. Grafting in usually practised on potted stocks of Azales pronicea and purpures, two easy-rooting strong growers. Modes are side, whip, tongue, and clett. Grafting must be done in the apring in a clone case placed in a house having a minmam warmith of \(65^{\circ}\). It is as well to use grafting-wax to cover the point of junction.
Bоокs: G. A. K. See p. 436 of our issue for Oct. 12, the preaent year.-Enquiver. The Dictionary of Gardening, by Mr. G. Nicholson and othere, publinhed at the Bazaar office, 170, Strand, would afford the information required. Hardy Ornamental Trees, \(\mathrm{gco}_{\mathrm{o}}\) A. D. Webuter; 1, Ciement's Inv, Strand.-E. Grimsdick of Sons. Obtain The Nursery Book: a Complete Guide to the Pollination of Plants, by L. H. Bailey, New York Pablishing Co., through any foreign bookeller.-Joe. Propagation and Improvement of Plants (Barbidke), How Crops Grow (8. W. Johnson). The Fruit Manual (R. Hoge), Plant Life (Dp. Maetere).
Bottling Tomatos: J. G. Bottle Tomato an jou would any otiaer kind of frait. Your beat chance of auccess will be to gather them before they are very ripe and jaicy. Tomatos do not, as a rule, keep well, unlest they are plensifally mixed with vinegar and spice. We gather from your note that you wish to bottle the fruit whole, and without any adjanct.
Catrrpillar in Apple Tres Stia: Enquirer. The apecimen sent is the caterpillar of the Wood Leopard Moth. When holes in fruit or other trees with what seems like sa w-dust lying on the ground beneath are noticed, the grab it at work within, and to kill it force a plece of wire up into the hole, or inject atrong tobacco-water.
Cattleya and Jatelia in an Ungatisfactory Statm: W. S. Either the house in which are the Cattleya and Laolia must be too hot and clone, or in some other way unaitable to the plante, or elee they would develop preudo-balbs. Examine the arrangemont for heating and vensilation. The term, "entablished in sheath or bud," applied to a number of plante, would mean that they were not freshly imported, bat cultivated plants, and that each would have either a flower-sheatb, from which bads might be expected, or viaible buds.
Chrysanthemums for Blooming in the Open in November: W. Price. The Pomponm of all varieties are excellent, giving quantities of bloom, and looking well when planted in bed by themelves. Mont of the Queen of England varieties in incurved make a good how, and not being tall growert, requiring unaightly long atakes to support them, they are admirable for planting on sheltered borders and against walle. Japanese varieties are Dr. Macary, Peter the Great, Elaine, Margot, Daimio, Lacroix, Geo. Gordon, Harlequin, and probably many others,
Corbrctions.-In the Royal Horticultral Society's Report, November 16, re Laddemanuia trifolia, read L. trilobe ; and for Cvpripedium Pollettianum Burford Beauty, read C. P. B. variety.
Eigit Hundred Fegt of Glasshouse Unhrated: Alpha. It might be filled with Rhododendron hybridum, Crocas, early Talips, Hyacintha, Narciasue, Sullae, Spirran, and Chriatman Rose (Helleborns niger). There would be no need to use pots for any of these.
Erica: C. H. J. When the growthe are about half mature, and they should be taken from the more exponed wood at the sides and top of the plants. They should not exceed 1 inch in length, and the leaves on the lower half mut be carefully removed. Strike in pare ailver-and, overlying sandy peat, in pote of not more than 5 inches in
diameter. Water well, allow the cuttings to get dry, then cover with bell-glese, and place in a low pit or house, having a temperatare of \(60^{\circ}\) Shade them from direct aunsine. Ramove the glaes daily, and wipe it dry, replacing it in aboat a quarter of an bour. Apply water when necessary, and carefully guard agaiuat damp; therefore let no decaying calliog remain in the glam.
Grapes: W. A. Madreatield Court, Frontignan (grizzly), and Fonter's Seedling, being early varioties, ancceed together ander one kind of treatment.
Insecta: \(W, P_{0}, N_{0}\) The grube of a apecien of weevil,
Judenng Vegetablea at a Show: h. h. P. We think that the \(+x\) bibitor of collection B, ought to have been disqualifed for showing pine kinds where only eight were required, and the first prize given to \(\Lambda\)., not because his were the butter productions, but simply for the staton that B. wet "out of it "owing to disqualification. If there is a achedule it rales ebould be abided by, and thore trangressing them auffor in consequence.
Manurina Tonatos: T, P, R. Stable manure in n partially rotlen condition, and quicklime, will be suitable, but the land should not be rendered very rich, or your plants will run too much to leaf, and they may auffer badly from diseases of one wort or another. The Tomato likes a dryish, lonmy moil; and manure at the time there is the greateat call on the energies of the plant, and this is best afforded by top-drensings of artificials or atable draininga.
Marguerite with Mites upon Roots: J. K. We notice numbers of mites upon the roote, bat they are not likely to cause any injary to the plants.
Muscat of Aurxandela: \(D\). K. The two names given are idenucal whith the above, which has many more synonyms. The only distinct variety is the Canon Hall Muscat.
Namps of Fruits: Subecriber. Worksop. Apple Bibaton Pippin-Sigma. Tre Pear is Baronne de Mello; Apple reserubles King of the Pippine, but we are not certain; fruit danaged.-H.B. Durham. 1, Waltham Abbey Spedling; 2. Old English Cudia; 3. New Hawthornden; 4 Worceater Pippin; 5, not known; 6. Tibbecte Pearmain.Jo Rose. Apple American Mother,-Racio, 1, Pear Uvedale's St. Garmain ; 4. Baurí' Del ; 2,
Cox's Orange Pippin; 8 Kerry Pippin; 6 Fearn's Cox's Orange Pippin; 8 Kerry Pippin; 6, Fearn's' Pippin; 5, a pretty bat worthless fruit.
Names of Plants: Correapondents not answered in this isone are requested to consult the next number.E. H. C. Aster ericoides.-J. B. S. Pleria ambrosam. - G. S. F. 1, Dendrodiua apecionum; 2, Brastavola nodoma.
Neapolitan Violets in Flower at the End of Drcmbrer: Hulda May. It they will not thower with cold frame treament, you cannot basten them by uving heat without apoiling the plante. For early blooming, de Parme and Marin Louice are better; asidouble-flowered varieties-Neapolitan coming into bloom in quantity late in the winter. The proper sort of anmmer treatment of plantednot ranners has much to do with the flowering of Violets, but we do not know what this was in your case.
Peach-hodse for Mariet Culture: T. P. R. Spanroofed house, with ratter 12 -feet long, no side lights, low side wall of weather-boarding, tarred, and aprinkled with sand and lime. The root should be fized, a 2 feet apace on either side beiog left for ventilation, and which can be closed by over-lapping lights, to be opened and thut by acrew or lever. There ahould be ample ventilation by means of hit-and-miss shattere or clappers. Hot-water-pipes ahould not be placed between the atems of the trees and the walla, but 2 feet away atem of the treen and the wallis, bat 2 feet away
from the former. No laid pathway ie required, lattice or apar gangwayesofficiog. If early forciog is intended, have double wooden wall with a 6 -inch epace between, or employ bricke or concrete, whichever is the cheapest. For training the treea employ atout iron wire (not galvanised) ren through eyed spikes 15 inchet long, driven into the rafters, no need to have acrew ends, these length of wire being at not more than 8 inches sombt. Train the trees fanwise, and plant them at 20 feet apart, with ridera, have 5 or 6 feet etemt midway between the fans, to bo cat awav at the latter encroach npon them, and finally removed altogether. Use plenty of loam, lime-rabble, and road-grit as well, if the voil be natarally heavy,
and see that the drainage is good. Plant the trees within 6 inche of the side walls, and let the roots ran outside and inside. The borders need not be made up to their full width for two or three yeary.
Peaches Preserved Whole: J. D. R. A clever cook tells us that these fruit are preserved by immersing them for balf-a-dezen times in boiling, thick grad, letting them ramain in it each time for fire minates, and laying them on a sieve to drain pach time that they are taken out of the ayrap. They are then placed in cold, thin, angary ayrap, and corked down securely, the end of the bottle being then dipped in melted wax. The fruit mast be without braise or blemish, and not ripe enough for dessert purposes.
Popular Apples: Sir C.S. The Apple referred to was Peasgood's Nonsuch, said to have been raised from a seed sown hy a young lady at chool, nursed up with kill and care under the same fontering, and finally planted in her wedded-home garden, where the new Apple exceeded the moat eadguine expectation of the raiser and her frienda, and it is already recognised as one of the mont popular and profitable market Apples of the day. D. T. F.

Pbicre or Books: N. 1, We are unacquainted with this book; 2, the price of this book we do not know. It is pabliahed at New York, by G. P. Patnam' Sons, and you should enquire at their London branch, 27 King William Sireet, Strand, W.C. . f10 10s.; 4, about 15s. Pablishers should advertise their wares like other people, and not expect us to give them gratic advertisement in addition to editorial notice.
Quassia-watbr for Killing Aphis, \&c.: T. A. B. Boil 4 oz . of Qaasaia chips in 1 gallon of water, and add 40 z . of noft-soap, which should be dismolved in it as it cools. In about ten minates after it has been applied to a tree, scc, ayringe it off with clean water.
Schbdule: Collection of Vegetables, Eight Distinct Varibties: W. B, For varieties write kinds; for inatance, Cauliflower is a kind or sor of vegetable; but Early London is a variety of Caaliflower. If you show two varieties of any one kind in a collection, you ought to be diequalified and we note that you include in your liat two varieties of Potatos, two of Onions, two of Car rots, and two of Tarnip. We should greatly doubt if the chedule-framers intended that exhibitors ahould construe it in that light.

Serding Apple: J. House, A showy fruit, noft in lesh, and not of much flavour. Nice for home pap, but not fit for market purposen, apart from ite high colour
Trichopilia suavis: Suavis. The white Trichopilia suavs alba is atill a rave plant. Some varieties open white, but soon abow colour, and auch are not trae." To be "alba" no rone colour should appear in the flower at any stage.

\section*{WATER SUPPLY!! - WATER SUPPLY!!!}

\section*{JOHN BLAKE'S}

PATENT
For RAISING WATER for the Supply of Towns, Villages, Irrigation, Railway Stations, Mansions, Fountains, Farms, \&c. No cost for Motive Power, which is obtained from a Stream of Water passing through the Ram. No Oiling or Packing required. Made in sizes to raise from
 300 to 400000 gallons per day. Will force to a height of 800 feet.
\begin{tabular}{|c|c|}
\hline In & This View represents a Ram
worked by impure river water. Whilat pumping pure water
from a well or spring and from a welt or sprigg and
forcing it to small reservoir on the hill. at an elevation of
532 ft ., and a distance of one mile, from which reservoir the extinguikhing
requirements \(\begin{gathered}\text { and } \\ \text { of maneion, }\end{gathered}\) stables, farm, and village. \\
\hline
\end{tabular}

TESTIMONIALS:

From T. FEBNYHOUGH, Esq., Agent to the RIGHT HON. LORD HINDLIP, DEAR SIR, - Braaley, Ashbourne, Deror months ago for the Right Hon. Referring to the two Patent "B" Rams you gtarted to congratulate you on the fuccess cf
Lord Hindlip, on the Alsop-en-le-Dale Estate, I am glad your attempt to raise the necesary 63 times that of the working fall. The Rams are raise the water being more than 63 times that small working fall of 8 ft . 3 1ns,, and worked by water from the close by is a copious stream of pure spring water, 8000 gallous per day of which the Rams force to a reservoir three-quarters of a mile distant, and at the extraordinary height of \(\mathbf{5 2 3} \frac{1}{2} \mathrm{ftu}\) above the Rams. The water is then gravitated from the reservoir to the several farms and houses on the estate, giving an ample supply to each, an
good orerflow at the reservoir. grest ease and smoon that the Rams lift more water than you promised, and seem to work with From the RIGHT HON. THE EARL OF HARROWBY, 44, Grosvenor square, London,

SIR. - Thave pleasure in stating that the two Hydraulic Rams which you supplied avd fixed for me last autumn, at Sandon, bave proved so far most successful, and that the work gives every promise of durability, while the economy, compared with the former mach smaller and intermiltent supply by steam-pump, will be considerable.
W ith a fall of about 14 ft . from a previously-existing mill-pool, the Rams supply re:ervoirs 168 ft . above the brook whenoe the water is forced, through pipes \(1 \frac{3}{3}\) miles in length. They tent up, as long as I required it, about 41,000 gallons per day. I now generally work the two Rams alternately (for a fortnight or so each).
full supply of 41,000 gallons should be needed
full supply of 41,000 gallons should be needed.
ingular promptness and punctuality; and no local difficulties arose in the execution of the singular promptness and punctuaity; int men whom you sant from your works at Accrington. Wor am, sir, jour very obediont Servant,

From T. DYNE STBEL, Esq., M.Inst.C.E., Past President South Wales Inse of Engineers, Bank Chambers, Newport, Mon USK WATERWORKS.
DEAR SIR,Sk Waterworks, to be capable of raising 27,000 gallons per day, a height of purpoees of the orking fall of driving water of 27 ft , and on your guaranteeing that perfor 127 ft .. with a n order for the Ram. The machine you supplied has now been put to mormance, I gave goa tisfaction expectations saying that the following ats length of gur gratifying result of 83 por cent. of efficiency. The tests were carefuly made and repeated, The water measured and levels properly casen. Several trials were made, aud I thall be glad to rive any engineer interested in the subject facilities for repeating the tests at the spot. I mbs bere state that for the rising main I used a large diameter of pipe, in order to reduce friction, with excellent effect,-Yourg faithfully,

From Martin CURTLER, Esq., Agent to the Right Hon. LADY NORTHTIOL Sansome Place, Worcester.

Feb. 18, 1895.
DEAR SIR, the Right Hon. Lady Northwick, at Northwick Park, last year, has worked, and is working most satisfactorily. Nater, as fou kow with 1,900 yards of rising main pipe, 10 a large tank on the top of a hill, in arder to suppl saveral farms on the estate with water by gravitation.

The supply to the tank is most ample, and there is an adequate overflow left below the Ram Altogetber the work is a very great success,-Yours faithfully, MARTIN CURTLER
JOHN BLAKE, Oxford Street Works, ACCRINGTON, LANCASHIRE.

MESSRS. PROTHEROE AND MORRIS will SELL by AUCTION, At their Contral Sale Rooms, 67 and 68 , Cheapside, London,
December \(\%\), at half-past \(120^{\circ}\) Clock.
a magnificent consignment of cattleyas FROM A NEW DISTRICT.
Arrived in the most perfect condition
The Collector writes:-"The plants I am now sending you are in three distinct varieties, and not any more will be sent, being very scarce; in fact, the district is cleared. These should not be confounded with the ordinary Cattleya of Caracas. The varieties are extraordinarily fine, with large flowers, varying from dark velvet to most brilliant crimson; the labellum, of magenta, is richly striped with orange
These plants were collected on Cool High Mountains at an
altitude of 1750 feet, and with them came
4 plants cattleya reineckiana, true:
and 3 large plants Catrleya wagnerii, true;
also a quantity of picked plants of ONCIDIUM PAPILIO MAJUs.
into Europe.
Alao from a private Grower, 50 fine-grown plants of ODONbulbe on each plant. 100 , undowered, forf to five sPECTABILE.
About 1000 ONOIDIUM JONRSIANUM, few NEW BROMELIAS, NEW CACTUSES ; five plante of the famous CATTLEYA LUDDEMANNIANA, established twenty-five plants, unflowered, all in sheaths of Orchid called in ite native country Casco romano

\section*{WALLFLOWER RUBY GEM.}

This grand Novelty is certainly the most brilliant and effective variety of single Wallflower hitherto gent out.

The colour is a beautiful clear shade of Ruby-Violet, with a bluish satin-like sheen (quite unlike the old purple Wallfower, which is more dark and dull in colour), and when seen in a mass the effect produced is very siriking. It has the habit of the ordinary dark Blood Wallflower of mecium height, and the flowers are extra large and of good substance.
A coloured illustration of this Novelty will be issued with our General Seed Catalogae for 1898. Large Packets, retail, 18. ; Smaller Packets, retaill, 8d.

\section*{GRAND NEW CRIMSON}

PERPETUAL - FLOWERING CARNATION, URIAH PIKE.
(Grown by Mr. GRORGE MAY. Teddingtor, from whom we have bought the entire stock of seed grown this year, and now cffer the same for the first time.)
Awarded Six First-class Certifieates, besides the Silver-Gilt and Silver Medals of the R.H.S.
This is undoubtedly the Grampest Crimson Cariation ever offered, at the same time he zooat decided acquisition to the Tree or Perpetual-flowering class that has ever been raised In point of colour this noble Carnation reigns supremee, being a veritable Glowirg CrimsonELVET BELF, and in this respect ABsoLUTELY UNIQUE.
Packets of 50 Seeds, retail, 2 s . 6d. each; Packets of 25 seeds, retail, 15. 6d. oach

\section*{SWEET PEA CUPID.}

We call special attention to the new dwarf SWEET PEA CUPID, a most unique Novelty of American origin, for which we have been appointed by the Vendore, MESSRS. ATLRX BURPEE, AND CO., PHILADELPHIA, Sole Agents for the dibtribation to the Trade in Great Britain, the Austraisan Colonies, and India.

A brief Description of Cupid (the only dwarf Sweat Pea ever known).-The folige is very dark green ; blossoms pure waxy-white, of unequalled subetance, and fuly as large as "Emily Henderson." The plant does not grow over 5 inches high, and never more than 12 t 15 inches in diameter. The stems are about 4 inches long, bearing two or three blossoma, all very near the end of the stem. It is a wonderfully free bloomer, and begins to flower as early as May and continues until November. The seed is white, and of usual size.
Packets of 20 Seeds, retall, 18. each; Half-size Packets of 10 Seeds, retall, 8d. each Electros, for use in Catalogue, sapplied free on application.
important novelty of last year.
PRIMULA FIMBRIATA RUBRA SUPERBISSIMA.
This grand new Primula may be described as the red counterpart of P. alba magnifica,
The fringing of the extra large bold flowers-which are of great sabstance-isof the same hosy character as in P. alba magnifica, and which distinguishes that variety from all others; while the colour is that of the best type of the ordinary "rubra."

Per Packat, retall, 2s. 6d.; Larger aize Packets, retail, 3s. 64 for prices to tae trade. see our novelty list.

\title{
W. W. JOHNSON \& SON, SEED GROWERS and MERCHANTS, BOSTON, LINCOLNSHIRE.
}

6 BOSTON UNRIVALLED.

A NEW, PERFECTLY DISTINCT, and VALUABLE ACQUISITION.
An unusually prolific, dwarf, wrinkled, Second Early Marrowfat, of the best table quality. Height, 21 to 3 feet; pods large, 5 to 6 inches in length, of the "Telephone "shape and colour, but more even in size than that well-known variety, there being from 9 to 11 fine peas in the pods. These mostly hang in pairs, literally covering the haulm, which is robust, and not subject to mildew.

A first-class Pea for either Private Gardens or Market Growers, and as an Exhibition variety must rank as 8 decided improvement and great acquisition in profitable Horticulture.

FERNS IN POTS.

AN enquiry was made by a correspondent "C. B. C." wo long ago as last June, as to whether any British speoies of Ferns are grown in pots, and a auggestion that a further deacription would be of interest. I would, in the first plaoe, refer him to the view of my fernery, whioh appeared in thene pages (Aug. 27, 1802), together with come details whioh he may find of value. As regards potoulture or otherwise, mont of the plant are in pots, and only a few actually in the soil. The reason for this is that in practioe Ferns planted in the soil under the favourable conditions induced by a covering of glam, mpeedily interfere with one anotber as they develop, and form a jangle in which the individual beanty of each plant is altogether marred or hidden. If in pots, on the other hand, not only is the fresedom of growth somewhat checked, but it is quite easy to shift and readjust from time to time as the need for greater space arises. Another advantage is that in the winter, when the deciduous Fern are down, the still presentable evergreen ones oan be rearranged, 10 as to maintain a good effect while, were they in the soil itself, abifting at that time would be detrimental. To obviate the unpicturesque appearance of ordinary pots, I use a number of rustic ones of various forms, and mix these and all others, as far as possible, with burrs. In fact, the plan of my fernery is all rockwork, and instoad of planting the Ferne alone in the nooks and orannies oreated for them, I insert the pots as well. The fernery is somewhat oblong, 18 by 14 , one end being formed by the wall of the dwelling-house containing the diningroom window, and the opposite end by a very roughly-built burr wall. As an mmusing instance of the British workman's peonliarities, I may mention that, having provided so many loads of burrs for the bricklayers for this wall, I had oocasion to be absent for a few days, and on my return, found a plain ordinary brick wall ereoted, it being, as I was told, "impossible to build a wall with stuff like that supplied." I made them pull it down, and called in an intelligent blacksmith, who undertook the job, and did it splendidly. Upon this wall there are fired aeveral large cork pockets, oonsisting merely of large curved pieaes of oork wired stroagly together with oopper wire to the requisite size and shape, and then tied by same means to stout nails and hook driven into the wall. Thene reoeptacles are filled with soil, and not only hold plants as pots would do, but also socommodate a number whioh were inserted as seedlings into holes made through the oork here, there, and yonder. Sundry flat-sided rustic pots are also hung wherever they can he accommodated, no that the wall is fairly covered with foliage. The roof at this end, being boarded over for ahout
